School Counseling from a Multicultural and
an Ecological Perspective: An Introduction xxvii
HARDIN L. K. COLEMAN AND CHRISTINE J. YEH

1 Introduction to the Field of School Counseling

I History of School Counseling 3
JOHN J. SCHMIDT

II A Concept of Best Practices in Training School Counselors 15
ROBBIE J. STEWARD, DOUGLAS M. NEIL, AND MATTHEW A. DIEMER

III School Counseling: Moving Toward Standards and Models 37
CAROL A. DAHIR

IV Student Accomplishment: Equity and the School Counselor's Role 49
HARDIN L. K. COLEMAN

V Understanding Yourself as a School Counselor 63
CHRISTINE J. YEH AND STEPHANIE T. PITUC

2 Diversity and School Counseling

VI The Acculturative Environment of Schools and the School Counselor:
Goals and Roles That Create a Supportive Context for Immigrant Adolescents 79
EDISON J. TRICKETT AND DIANA FORMOSO

VII Immigrant Children and Youth in Schools 95
SARAH J. LEE AND KAREN A. CORT

VIII Racial Harassment in American Schools 111
ROBERT T. CARTER, TAMARA R. BUCKLEY, AND SCHEKEVA P. HALL

IX The Role of Ethnic Identity in the Practice of School Counseling 127
SHANNON CASEY-CANNON

X Understanding and Implementing Gay, Lesbian, Bisexual, Transgender, Questioning Affirmative Practices as School Counselors 135
SHELBY J. SEMINO

XI Social Class in School Counseling 145
WILLIAM MING LIU, ALICE FRIDMAN, AND THOMASIN E. TRANEL HALL

XII Disability in the Schools 157
TINA M. ANCTIL AND STEPHANIE SAN MIGUEL BAUMAN

XIII Race and Ethnicity in School Counseling 177
MARIE L. MIVILLE

XIV African American Empowerment in Secondary School Counseling 195
LEON D. CALDWELL, RICHARD OLDFIELD, BETTINA M. BEECH, AND VANN PRICE

3 Student Development

XV Facilitating Personal and Social Development 209
NANCY BODENHORN

XVI Physical Health and Emotional Development: A Primer for School Counselors 219
LAURA FILLINGAME KNUDTSON AND HARDIN L. K. COLEMAN

XVII Adolescent Sexual Health and Development 243
LAURA FILLINGAME KNUDTSON AND HARDIN L. K. COLEMAN

XVIII School Counselor's Role in Promoting Literacy in Elementary School–Aged Children 259
CARRIE J. LINSKENS AND HARDIN L. K. COLEMAN

XIX Designing Culturally Responsive School Counseling Career Development Programming for Youth 269
KIMBERLY A. S. HOWARD, V. SCOTT H. SOLBERG, NEETA KANTAMENI, AND MELISSA KRAEMER SMOTHERS

4 School Counselor Competence

XX School Counselor Training: School and Societal Needs in the 21st Century 293
JOHN L. ROMANO, KAY HERTING WAHL, AND JULIE M. KOCH

XXI Supervision of Professional School Counselors 309
DIANA GRUMAN AND MARY LEE NELSON

XXII Multicultural Competence of School Counselors 321
DELILA OWENS AND MADONNA G. CONSTANTINE

XXIII Consultation With Teachers, Administrators, and Counseling Agencies 329
ROBERTO CLEMENTE

XXIV The School Counselor's Role in Creating Caring School Communities 351
JENNIFER J. LINDWALL AND HARDIN L. K. COLEMAN

5 School-Based Interventions

XXV Youth Development and Prevention in the Schools 381
SALLY M. HAGE, JONATHAN P. SCHWARTZ, AND SARA BARNETT

XXVI Individual Counseling as Intervention in the Schools 397
JERI L. LEE AND STACIE E. PUTMAN

XXVII Focused, but Flexible: A Developmental Approach to Small Group Work in Schools 409
JEAN SUNDE PETERSON AND HEATHER L. SERVATY-SEIB

XXVIII Conducting Groups in Schools: Challenges and Rewards 431
DENISE BEESLEY AND LISA L. FREY

XXIX Families in Context: An Essential Component of School Counseling 449
TERENCE PATTERSON

XXX Crisis Management in the Schools 459
MICHELLE L. MURPHY

XXXI Consultation and Collaboration as Essential Services for School Counseling Programs 481
MICHAEL B. SALZMAN

XXXII Career Development Interventions in Schools 497
WEI-CHENG J. MAU

XXXIII Creative Arts Counseling in Schools: Toward a More Comprehensive Approach 517
CAROLINE S. CLAUSS-EHLERS

XXXIV Counseling the Gifted and Talented 531
CORISSA C. LOTTA, BARBARA A. KERR, AND ERICA A. KRUGER

XXXV Cultural Identity Enhancement Strategies for Culturally Diverse Youth 563
HARDIN L. K. COLEMAN, SARA CHO KIM, AND A. YANG

6 Working With Socioemotional Challenges

XXXVI Interpersonal Relationships 587
STEPHANIE T. PITUC AND TRACY R. JULIAO

XXXVII Suicide Prevention, Intervention, and Postvention 613
SHERI BAUMAN

XXXVIII Working With School Failure 635
KAREN A. CORT

XXXIX Measuring and Evaluating Adolescent Connectedness 651
MICHAEL J. KARCHER, MICHELLE R. HOLCOMB, AND ELIAS ZAMBRANO

XL Bullying and Peer Victimization 673
SUSAN M. SWEARER, ERIC S. BUHS, AMANDA B. SIEBECKER, KELLY BREY LOVE, AND COURTNEY K. MILLER

XLI School Violence 693
ANNE GREGORY AND ELISE CAPPELLA

XLII Substance Abuse 717
CHRIS WOOD AND LISA HINKELMAN

7 Accountability and Professional Issues in School Counseling

XLIII Evaluating School Guidance and Counseling Programs: Past, Present, and Future 739
NORMAN C. GYSBERS

XLIV Research in and on School Counseling 751
BRYAN S. K. KIM AND SAUL G. ALAMILLA

XLV The Essential Role of School–Community Partnerships in School Counseling 765
MARY E. WALSH AND JILLIAN DePAUL

XLVI Law and Ethics in School Counseling 785
PATRICIA L. WOLLEAT

XLVII Professional Activities in Professional School Counseling 811
KEITH M. DAVIS, LAURIE L. WILLIAMSON, AND BARBARA A. SCARBORO

CONTRIBUTORS
(in alphabetical order)

Saul G. Alamilla
University of California at Santa Barbara

Saul G. Alamilla, MS, MA, is a doctoral candidate in the Department of Counseling, Clinical, and School Psychology at the University of California at Santa Barbara. He received a BA degree in sociology in 2002 and an MS degree in counseling in 2004, both from the California State University at Fullerton. He earned an MA degree in counseling psychology from the University of California at Santa Barbara in 2006. His current research interests include Latino/a mental health, ethnic/racial psychology, and the measurement of cultural constructs.

Tina M. Anctil
Washington State University

Tina M. Anctil, PhD, is Assistant Professor of counseling psychology at Washington State University. She coordinates the EdM in School Counseling Program at WSU and is the administrator of the WSU School Counseling Professional Education Advisory Board. In addition to teaching in the School Counseling Program, she is a licensed professional counselor and a certified rehabilitation counselor. She has worked in school settings across the country, assisting children and adolescents with disabilities with their educational and career development pursuits. Her research agenda is varied but is fundamentally concerned with how schools can empower all students to achieve in spite of life's challenges including disabilities, mental health disorders, poverty, and other risk factors.

Sara Barnett
Teachers College, Columbia University

Sara Barnett, MA, MEd, currently teaches fifth grade in the South Bronx as member of the New York City Teaching Fellows Program. She holds a BA from Harvard University and an MA and EdM in counseling psychology from Teachers College, Columbia University. Her research interests include minority student achievement, majority privilege, and racial-cultural identity development, among others.

Sheri Bauman
University of Arizona

Sheri Bauman, PhD, is Associate Professor in the Department of Educational Psychology and is director of the MEd program in School Counseling and Guidance at the University of Arizona. Her research focuses on school bullying, with an emphasis on relational bullying and teacher responses to bullying. In addition, she conducts research on professional issues in school counseling and on aspects of group work. She is editor-elect of the *Journal for Specialists in Group Work* and will become editor in July 2007. She is a licensed psychologist with a small clinical practice in Las Cruces, New Mexico.

Stephanie San Miguel Bauman
Washington State University

Stephanie San Miguel Bauman, PhD, is Associate Professor of counseling psychology at Washington State University. She coordinates the EdM in Counseling Program at the WSU Tri-Cities campus and is a member of the WSU School Counseling Professional Education Advisory Board. She received her PhD from the University of California at Santa Barbara in 1995. Her research interests include risk and resiliency factors for children of color, children with chronic illnesses, and their families. She has published in the areas of social support for families of children with autism, learning disabilities and social skills, and multicultural counseling.

Bettina M. Beech
University of Memphis

Dr. Beech is Associate Professor in the Department of Psychology. She received her DrPH in community health sciences in the School of Public Health from the University of Texas Health Science Center at Houston and a master's degree in public health from Temple University. She has focused her research in the area of behavioral risk factors that contribute to chronic diseases, specifically among adolescents and ethnic minority populations. Dr. Beech has been the Principal Investigator of 14 grants from the National Institutes of Health, The Assisi Foundation, and Memphis Alliance for Public Health.

Denise Beesley
University of Oklahoma

Denise Beesley, PhD, is Associate Professor of educational psychology at the University of Oklahoma (OU). She currently serves as the Coordinator for the school counseling program and as Director of the OU Counseling Psychology Assessment Clinic. Her research interests include school counselor and teacher training, working with at-risk youth, diversity issues, relational and behavioral health, and psychological and psycho-educational assessment. She serves on the Editorial Board of the *Journal of School Counseling*.

Nancy Bodenhorn
Virginia Tech

Nancy Bodenhorn, PhD, was a school counselor for 20 years before earning her PhD in counselor education. Nancy's career has included counseling at all three academic levels, alternative schools, and gifted and talented magnet schools. She has worked in schools in four different states as well as in international schools in Kuwait, Bangkok, and Brussels. After that exciting career, Nancy is following a new direction, transferring her passion to the next generation of school counselors. She earned her PhD at Michigan State and has been teaching at Virginia Tech since 2001.

Tamara R. Buckley
Hunter College, City University of New York

Tamara R. Buckley, PhD, earned her doctorate in counseling psychology from Columbia University, Teachers College in 2001. She is currently Associate Professor at Hunter College, City University of New York in the Department of Educational Foundations and Counseling Program, and she is a New York State licensed psychologist. Dr. Buckley's research focuses on racial identity and health, educational, organizational outcomes.

Eric S. Buhs
University of Nebraska–Lincoln

Eric S. Buhs, PhD, is Assistant Professor of educational psychology at the University of Nebraska-Lincoln in the Cognition, Learning, and Development program. His research interests include examining children's peer relationships and school adjustment with a focus on the role of behavioral correlates of peer rejection and the examination of cultural and ethnic differences in aggression. He has been conducting and publishing research using longitudinal examinations of peer rejection effects on victimization, social exclusion, and classroom engagement and is currently examining potential effects of aggression and victimization on adjustment in Latino adolescent populations.

Leon D. Caldwell
University of Memphis

Leon D. Caldwell, PhD, is Visiting Associate Professor of counseling psychology in the Department of Counseling, Educational Psychology, and Research at the University of Memphis. Dr. Caldwell's research focuses on the cultural determinants to health behaviors, African American male mental health promotion, adolescent mental health promotion, youth development and violence prevention intervention, and academic performance of African American and other underrepresented students. Dr. Caldwell has served as a consultant on national projects involving issues such as gang prevention, health disparities elimination, cultural competence, and the academic achievement gap.

Elise Cappella
Institute for Juvenile Research, University of Illinois at Chicago

Dr. Cappella is Assistant Professor at the Institute for Juvenile Research, University of Illinois at Chicago. She received her PhD in clinical–community psychology from the University of California, Berkeley. Her research integrates education and psychology with the goal to understand the social–emotional and academic development of children in schools. She currently is studying an intervention to promote learning and positive behavior among students in urban high poverty schools and has conducted research on children's peer relationships and achievement trajectories. Dr. Cappella began an appointment as Assistant Professor in the Department of Applied Psychology at New York University in 2007.

Robert T. Carter
Teachers College, Columbia University

Robert T. Carter, PhD, is Professor of Psychology and Education in the Counseling Psychology Program at Teachers College, Columbia University. Dr. Carter is known internationally for his work on Black and White racial identity. He has published in the areas of psychotherapy processes and outcome, career development, cultural values, racial identity issues, educational achievements, and equality in education through the lens of racial identity. He also provides consultation on organizational, legal, and educational issues associated with race and diversity.

Shannon Casey-Cannon
Alliant International University

Shannon Casey-Cannon, PhD, is Assistant Professor at the California School of Professional Psychology at Alliant International University. She is currently doing research related to ethnic identity, cognitions associated with shifting between diverse cultural environments, and minority student achievement. Dr. Casey-Cannon teaches Psychometrics, Statistics, and Research Design, as well as courses related to cognitive behavioral therapy.

Sara Cho Kim
University of Wisconsin–Madison

Sara Cho Kim, MS Ed, is a 5th-year doctoral student in counseling psychology at the University of Wisconsin–Madison. She has presented and published on topics related to cultural identity formation, psychosocial factors in student achievement, and stereotype threat. Her major research interests are in studying cultural and contextual factors influencing psychological processes and outcomes for Asian Americans. In addition, she has taught courses on multicultural counseling and career development as an adjunct professor at Shippensburg University. She received her master's degree from the University of Pennsylvania.

Caroline S. Clauss-Ehlers
Rutgers, the State University of New Jersey

Caroline S. Clauss-Ehlers, PhD, is Assistant Professor of counseling psychology at the Graduate School of Education, Rutgers, the State University of New Jersey. Her research interests include cross-cultural psychology with children and families, bilingualism in psychotherapy, resilience, and public education through the media. A key interest is to explore what fosters resilience in children and adolescents at home, in the community, and in schools. Her recent books include *Diversity Training for Classroom Teaching: A Manual for Students and Educators* (Springer, 2006), and she was coeditor of *Community Planning to Foster Resilience in Children* (Kluwer Academic Publishers, 2004).

Roberto Clemente
Roosevelt University, Chicago

Roberto Clemente holds a PhD in counselor education from Oregon State University, a master's in school guidance, and a bachelor's in science education from the University of Puerto Rico. He was an Associate Professor at the University of Northern Iowa and is currently at Roosevelt University in Chicago in the Counseling and Human Services Department. He has written two book chapters and several refereed articles, and has coauthored a book on ethnically diverse children and counseling interventions. In addition to providing sensitivity and multicultural training in schools and mental health agencies, he has conducted international consultation activities in St. Petersburg, Russia, Guatemala, Mexico, and Puerto Rico.

Hardin L. K. Coleman
University of Wisconsin–Madison

Hardin L. K. Coleman, PhD, is Professor of counseling psychology and Associate Dean in the School of Education at the University of Wisconsin–Madison. His primary teaching and training focus is on the development of school counselors and professional development training in multicultural competence for teachers. His clinical focus is with lower income African American families with a particular interest in adolescents. His current research focus is on the noncognitive factors that affect minority student achievement in K–12 educational settings and interventions that enhance cultural identity development. His other research interests include the development of cultural identity, strategies for effectively coping with cultural diversity, and bicultural competence.

Madonna G. Constantine
Teachers College, Columbia University

Madonna G. Constantine, PhD, is Professor of psychology and education in the Department of Counseling and Clinical Psychology at Teachers College, Columbia University. The scope of her work includes exploring the psychological, educational, and vocational issues of African Americans; developing models of cross-cultural competence in counseling, training, and supervision; and examining the intersections of variables such as race and ethnicity in relation to mental health and educational processes and outcomes. She is currently involved on several editorial boards in her field, and she serves in various leadership capacities in counseling and psychological associations across the country.

Karen A. Cort
Teachers College, Columbia University

Karen A. Cort is currently a doctoral candidate in counseling psychology at Teachers College, Columbia University. She received her MA and EdM in psychological counseling, and MPhil from Teachers College, Columbia University. She has worked with students for over 10 years in academia, serving as a high school counselor for 5 years and as an adjunct faculty member at LaGuardia Community College, John Jay College of Criminal Justice, and Dowling College. Her research interests include race, education, and adolescent development, specifically focusing on students of color.

Carol A. Dahir
New York Institute of Technology

Carol A. Dahir, EdD, is Associate Professor in counselor education at New York Institute of Technology. Dahir is the coauthor of *The National Standards for School Counseling Programs* (1997) and has also coauthored *The Transformed School Counselor* (2006) and *School Counselor Accountability: A Measure of Student Success 2e* (2007) with Carolyn Stone. She writes and presents extensively about transforming school counseling, school counseling program development, and accountability in textbooks, journals, publications, and professional development venues across the nation.

Keith M. Davis
Appalachian State University

Keith M. Davis, PhD, NCC, is a Licensed North Carolina School Counselor and Associate Professor in the Department of Human Development and Psychological Counseling at Appalachian State University, Boone, North Carolina. He has worked in public education as a high school teacher and high school and elementary school counselor.

Jillian DePaul
Boston College

Jillian DePaul, MA, MEd, is a doctoral student in counseling psychology at Boston College's Lynch School of Education. She received clinical training at a variety of settings, including Fenway Community Health Center, the Tufts University Counseling Center, and Chelmsford High School. Her research interests include systemic interventions in schools, gender identity and socialization, and issues of sexual orientation in schools. Prior to pursuing graduate studies in psychology, Jillian taught fifth grade for 2 years in Austin, TX, as a member of the Alliance for Catholic Education, a service program housed at the University of Notre Dame.

Matthew A. Diemer
Michigan State University

Matthew A. Diemer, PhD, is Assistant Professor in the Michigan State University MA Counseling Program. His teaching and training interests include preparing culturally competent counselors, social justice counseling perspectives, comprehensive guidance models, and integrating career development into the practice of (particularly school) counselors. His research interests include the cultural context of career development, facilitating sociopolitical development and critical consciousness among oppressed/marginalized individuals, and synthesizing these domains to explore sociopolitical development/critical consciousness as a predictor of career development and occupational attainment among economically disadvantaged youth of color.

Laura Fillingame Knudtson
University of Wisconsin–Madison

Laura Fillingame Knudtson, MA, is a doctoral candidate in counseling psychology at the University of Wisconsin–Madison. She earned her master's in educational psychology from the University of Minnesota. Laura's clinical work focuses on working with diverse adolescent populations as well as the clinical supervision of master's level counseling psychology trainees. She has conducted research in the areas of positive youth development, racial/ethnic identity development, minority student achievement, body image, and training medical professionals' skills in working with adolescent patients. Laura's current work focuses on adolescent sexual decision making and sexual health education.

Lisa L. Frey
University of Oklahoma

Lisa L. Frey, PhD, is Assistant Professor in the counseling psychology program of the Department of Educational Psychology at the University of Oklahoma. Her teaching and research has been greatly influenced by her previous clinical experience, which focused on work with youth who have experienced trauma and/or perpetrated violence, as well as individuals from diverse populations. Dr. Frey has consulted extensively in schools and community agencies. Her research interests are in the areas of at-risk youth, particularly youth who have been identified as delinquent and girls involved in the juvenile justice system; diversity; applications of the relational cultural model; and relational development.

Alice Fridman
University of Iowa

Alice Fridman is a doctoral student in her 3rd year of the counseling psychology program at the University of Iowa. She received her BA in psychology from Carleton College in 2003. Her research interests include social class and other multicultural issues, and her clinical interests include trauma recovery, diversity issues, gender issues, and play therapy.

Anne Gregory
Curry School of Education, University of Virginia

Anne Gregory is Assistant Professor in clinical and school psychology at the University of Virginia. She received her PhD from the University of California, Berkeley. Her research identifies contributors to the overrepresentation of African American students in the discipline system. Co-authored recent publications include, "The Discipline Gap and the Normalization of Failure," in P. Noguera and J. Wing (Eds.), *Unfinished Business: Closing the Racial Achievement Gap in Our Schools* (2006) and "School Climate and Implementation of a Preventive Intervention," *American Journal of Community Psychology* (in press).

Diana Gruman
Western Washington University

Diana Gruman, PhD, NCC, is Assistant Professor in the Department of Psychology at Western Washington University in Bellingham. Her primary area of teaching is in the CACREP-accredited school and mental health counseling programs. Dr. Gruman received her bachelor's degree in psychology from Whitman College, her master's degree in school counseling at Western Washington University, and her doctorate in educational psychology, with an emphasis on counselor education and supervision, at the University of Washington, Seattle. Her research interests include student mobility, effectiveness of school prevention/intervention efforts, and the professional development of school counselors.

Norman C. Gysbers
University of Missouri–Columbia

Norman C. Gysbers, PhD, is Professor with Distinction in the Department of Educational, School, and Counseling Psychology at the University of Missouri–Columbia. He is a licensed school counselor in Missouri. Gysbers' research and teaching interests are in career development, career counseling, and school guidance and counseling program development, management, and evaluation. He is the author of 79 articles in 17 different professional journals, 31 chapters in published books, 15 monographs, and 17 books. Since 1967, he has served as director of numerous national and state projects on career development and career counseling, and school guidance program development, implementation, and evaluation.

Sally M. Hage
Teachers College, Columbia University

Sally M. Hage, PhD, is Assistant Professor of psychology and education at Teachers College, Columbia University, Department of Counseling and Clinical Psychology. She is a licensed psychologist who earned her doctorate at the University of Minnesota and an MDiv from the University of Notre Dame. Her areas of special interest and research include prevention and training, spirituality and counseling, prevention of interpersonal violence, and multicultural psychology. She has written extensively in the area of prevention and psychology and she is the lead author of the "Best Practice Guidelines on Prevention Practice, Research, Training, and Social Advocacy for Psychologists," *The Counseling Psychologist,* 2007.

Schekeva P. Hall
Teachers College, Columbia University

Schekeva P. Hall, BA, is a doctoral student in counseling psychology in the Department of Counseling and Clinical Psychology at Teachers College, Columbia University. Her research interests include racial identity development, racial discrimination, and mental health with Black immigrant populations.

Thomasin E. Tranel Hall
University of Iowa

Thomasin E. Tranel Hall graduated with a BA from Gonzaga University in 2004 with majors in psychology and Spanish. She is currently working toward a PhD in counseling psychology at the University of Iowa. Her specific interests are in the areas of child developmental disabilities and behavior disorders, acculturation among Latino adolescents, and social justice issues in counseling psychology.

Lisa Hinkelman
The Ohio State University

Lisa Hinkelman, PhD, is Assistant Professor in the counselor education program at The Ohio State University. She is licensed as a school counselor in the state of Ohio and is licensed as a professional counselor. Her work includes serving as Project Evaluator for Project Success, an Elementary School Counseling Demonstration Act project in the Columbus Public Schools. She has published and presented on topics such as the development of leadership in school counseling students, girls' career development, body image and eating disorders, sexual assault prevention, and mental health issues in schools.

Michelle R. Holcomb
University of Texas at San Antonio

Michelle R. Holcomb, MA, is a Licensed Professional Counselor (LPC) in the state of Texas. She received her Bachelor of Science Degree in psychology from Angelo State University in San Angelo, Texas and her Master of Education in counseling psychology from the University of Houston. She is currently pursuing a doctorate in counselor education and supervision at the University of Texas at San Antonio. Michelle worked as a high school guidance counselor for 2 years in Houston and an LPC working with at-risk youth grades K–12 in San Antonio for 5 years.

Kimberly A. S. Howard
University of Wisconsin–Madison

Kimberly A. S. Howard, PhD, is Assistant Professor, the Coordinator of the School Counseling track, and the Chair of the Masters in Counseling program in the Department of Counseling Psychology at the University of Wisconsin–Madison. Dr. Howard's research interests include the examination of the career development process of diverse, low-income youth. She is interested in factors that promote vocational development and resilience, including supportive relationships and personal agency beliefs. Her early research explored the reasoning processes used by children and youth to understand career choice and career attainment. At present, she is engaged in an international study of protective factors that predict positive academic, career, and life outcomes.

Tracy R. Juliao
Genesys Regional Medical Center

Tracy R. Juliao, PhD, earned her baccalaureate degree in psychology from the University of Michigan. She pursued her graduate studies at Teachers College, Columbia University where she earned a Master of Arts in developmental psychology, a Master of Education in psychological counseling, and a PhD in counseling psychology. Tracy currently practices full time as a Health Psychology Fellow at Genesys Regional Medical Center in Grand Blanc, Michigan. Her primary research and clinical interests include multicultural issues in clinical practice, women's issues, effectiveness of family interventions, integrating health psychology within primary care, incorporating multiculturalism and behavioral medicine into medical education, and developing comprehensive pain management programs.

Neeta Kantamneni
University of Wisconsin–Milwaukee

Neeta Kantamneni, MS, is a doctoral student in the counseling psychology program at the University of Wisconsin–Milwaukee. She received her master's degree in counseling from the University of Wisconsin-Madison. Her research interests include contextual factors in vocational development and career interests, as well as multicultural counseling and competencies.

Michael J. Karcher
University of Texas at San Antonio

Michael J. Karcher, EdD, PhD, is Associate Professor of Education and Human Development and Coordinator of the School Counseling Program at the University of Texas at San Antonio. He has studied the phenomenon of connectedness in schools for 10 years. In 2002, he became the principal investigator for the Study of Mentoring in the Learning Environment (SMILE) funded by the William T. Grant Foundation. He is on the editorial boards of *Journal of Primary Prevention, Professional School Counseling, Journal of Youth and Adolescence,* and *Psychology in the Schools*, and is coeditor, with David L. DuBois, of the *Handbook of Youth Mentoring* published by Sage Publications in 2005.

Barbara A. Kerr
University of Kansas

Barbar A. Kerr, PhD, is Williamson Family Distinguished Professor of Counseling Psychology at the University of Kansas. Her interests include the psychology of optimal human development, including giftedness, creativity, and spirituality; counseling and psychotherapy; and gender issues. She is also a member of the National Association for Gifted Children.

Bryan S. K. Kim
University of Hawaii at Hilo

Bryan S. K. Kim, PhD is Associate Professor in the Department of Psychology at the University of Hawaii at Hilo. Previously, he was Associate Professor in the Department of Counseling, Clinical, and School Psychology at the University of California, Santa Barbara, and Assistant Professor in the Department of Psychology at the University of Maryland, College Park. Dr. Kim's research focuses on multicultural counseling process and outcome, the measurement of cultural constructs, and counselor education and supervision. Dr. Kim is an associate editor of *The Counseling Psychologist* and *Cultural Diversity and Ethnic Minority Psychology.* He also serves on the editorial boards of *Measurement and Evaluation in Counseling and Development; Journal of Counseling Psychology; Psychotherapy: Theory, Research, Practice, and Training*; *and Educational Review.*

Julie M. Koch McDonald
University of Minnesota–Twin Cities

Julie M. Koch, MEd, is a doctoral candidate in the counseling and student personnel psychology program in the Department of Educational Psychology, University of Minnesota–Twin Cities. She has worked as a school counselor at both elementary and high school levels and is a certified K–12 school counselor in the state of Texas. Her research interests include school counseling, multicultural counseling, international and immigrant populations, and counselor training and development. She is an active member of the American Psychological Association, American Counseling Association, and American School Counselor Association.

Erica A. Kruger
University of Wisconsin–Madison

Erica A. Kruger, M.S., is a licensed professional school counselor in Madison, WI. She earned her master's degree in counseling from the University of Wisconsin–Madison in 2004, with dual specializations in community mental health and K–12 school guidance. From 2001 to 2004, Erica also worked as a residential coordinator of summer enrichment programs for the Wisconsin Center for Academically Talented Youth. In addition to her experience in educational settings, Erica has also worked as an in-home family therapist at a local community mental health agency. Her interests include socioemotional concerns of gifted and talented youth, strengths-based practices for families, creating effective school-based intervention programs, and the personal and professional development of beginning school counselors.

Jeri L. Lee
Tennessee State University

Jeri L. Lee, EdD, is an Associate Professor and Coordinator of the Graduate Program in School Counseling in the Psychology Department at Tennessee State University. Dr. Lee is licensed as a professional school counselor, a teacher, and a counseling psychologist. Her research interests include legal and professional issues, program evaluation, and parenting strategies. Publications include a book, *The Two Yes Maxim: Maximizing Parenting Effectiveness*, and articles appearing in *Tennessee Psychologist* and *The Southern Speech Communication Journal*.

Sarah J. Lee
Teachers College, Columbia University

Sarah J. Lee received her MA and EdM in psychological counseling from Teachers College, Columbia University. She has worked with diverse populations in the City College of New York system as an instructor, counselor, and advisor providing students with personal and career counseling, academic advisement, educational planning, and mentorship. For the past 5 years, Lee has focused her research efforts in the areas of Asian Americans and mental health and addressing needs of immigrant youths in schools.

Jennifer J. Lindwall
University of Wisconsin–Madison

Jennifer J. Lindwall, MS, is a doctoral student at the University of Wisconsin–Madison in the Department of Counseling Psychology. Upon receiving her masters in counseling from University of Wisconsin–Madison, she became licensed as a school counselor and worked with elementary and middle school students. Additionally, Ms. Lindwall has worked as a teacher, mentor, and counselor for youth and their families in other settings, including precollege programs, an after-school program, a community counseling agency, and most recently primary care settings. She is primarily interested in school counseling, school psychology, prevention science, and developing effective interventions for culturally diverse youth.

Carrie Jo Linskens
Office of the Attorney General, Nevada Department of Justice

Carrie Jo Linskens received an MS in counseling from the University of Wisconsin–Madison, where she prepared for certification in both school and community counseling. She is currently working for the Office of the Attorney General in Nevada in the Medicaid Fraud Control Unit. Her responsibilities include investigating abuse and neglect of patients. The information in her chapter is based on her master's thesis completed in cooperation with the second author.

William Ming Liu
University of Iowa

William Ming Liu, PhD, is Training Director for the Counseling Psychology Program at the University of Iowa. He received his doctorate from the University of Maryland. His research and clinical interests are in social class and classism, poverty, and men and masculinity. He is on the editorial boards for *The Counseling Psychologist, Cultural Diversity and Ethnic Minority Psychology*, and *Psychology of Men and Masculinity*.

Corissa C. Lotta
University of Wisconsin–Madison

Corissa C. Lotta, PhD, is a faculty associate at University of Wisconsin–Madison, Department of Counseling Psychology. Her areas of primary interest include gifted and talented/creativity, clinical/communications training, at-risk youth, and diversity/women's issues. Within the Counseling Psychology Department, she teaches a variety of courses, supervises students' clinical work, and is the Masters and Doctoral Practicum Coordinator. In addition, she is developing counseling and support services for students in the School of Veterinary Medicine and clients in the Veterinary Medicine Teaching Hospital.

Kelly Brey Love
University of Nebraska–Lincoln

Kelly Brey Love, MA, is a doctoral candidate in school psychology at the University of Nebraska–Lincoln. She is currently completing her predoctoral internship in professional psychology at McLean Hospital/Harvard Medical School in Belmont, Massachusetts, and is working with the Klarman Eating Disorders Center and the Franciscan Children's Hospital in Boston, Massachusetts. Her research interests include analysis of aggressive, depressive, and anxious symptomatology in adolescents who witness bullying interactions.

Wei-Cheng J. Mau
Wichita State University

Wei-Cheng J. Mau, PhD, NCC, is a professor of counselor education at Wichita State University where he has been teaching career development and other school counseling courses since 1991. Dr. Mau has published over 40 journal articles, books, book chapters, reviews, and monographs. He has presented numerous papers at national and international conferences. His primary research areas include cultural differences in educational/vocational aspirations and career planning, academic achievement, help-seeking attitudes and behaviors, and computer-based career interventions. He has served on the editorial boards of *Journal of Vocational Behavior*, *Career Development Quarterly*, and *Measurement & Evaluation in Counseling and Development*.

Courtney K. Miller
Catholic Social Services, Lincoln, Nebraska

Courtney K. Miller, PhD, is currently completing a postdoctoral fellowship with Catholic Social Services in Lincoln, Nebraska, and is a provisionally licensed psychologist in the state of Nebraska. She received her doctorate of philosophy in the area of school psychology from the University of Nebraska–Lincoln. Dr. Miller's research interests include bullying and victimization among school-age youth; multisystemic interventions to support youth and families; and integration of spirituality within the therapeutic context.

Marie L. Miville
Teachers College, Columbia University

Marie L. Miville, PhD, is Associate Professor of psychology and education at Teachers College, Columbia University. She also is the Program Coordinator and Director of Training of Counseling Psychology programs at Teachers College. Professor Miville has conducted research and developed workshops on social attitudes and universal-diverse orientation, Latino mental health, and the interrelations of various aspects of identity, as based on race, culture, gender, sexual orientation, and ego identity among populations of color. Dr. Miville is the author of nearly 40 journal articles and book chapters dealing with multicultural issues in counseling and psychology. She is currently serving or has served on several editorial boards.

Michelle L. Murphy
University of North Florida

Michelle L. Murphy, PhD, LMHC, NCC is Visiting Assistant Professor in the Department of Leadership, Counseling, and Instructional Technology at the University of North Florida. Dr. Murphy has a dual specialization in mental health counseling and school counseling and guidance, and her current areas of emphasis include crisis intervention, suicide prevention, sexual assault, and relationship violence. She has worked as a high school counselor and a mental health consultant, collaborating with schools and community agencies to provide counseling services to at-risk youth. Dr. Murphy is an instructor and trainer for the North Florida Crisis Intervention Team and works with a local EAP providing crisis response services and critical incident stress debriefings.

Douglas M. Neil
Michigan State University

Douglas M. Neil, PhD, is Assistant Professor at Michigan State University's MA Counseling Program. Dr. Neil promotes the development of school counselors through highlighting the importance of attention to psycho-socioemotional development across the life span in his areas of expertise in teaching and research, which include multicultural counseling competence development, counseling supervision, and assessment. Dr. Neil also provides training in counseling supervision for post-master's level professionals in the community.

Mary Lee Nelson
University of Wisconsin–Madison

Mary "Lee" Nelson is Professor in the Department of Counseling Psychology at the University of Wisconsin–Madison. Dr. Nelson has recently coauthored a book titled *Critical Events in Psychotherapy Supervision: An Interpersonal Approach.* She has practiced school counseling and has trained school counselors for 13 years. Her research has focused on supervision processes, the relation of appearance talk to body dissatisfaction in adolescents, and the psychological experience of social class. She is currently on editorial boards of *Psychotherapy Research, Training and Education in Professional Psychology,* and *The Clinical Supervisor.*

Delila Owens
Wayne State University

Delila Owens, PhD, is Assistant Professor at Wayne State University. Owens has nearly 10 years of experience working with adolescents. Her areas of specialization include school counseling, adolescent counseling, career and counseling/development. She has taught courses such as Diverse Learners in a Multicultural Perspective, Child Development, Career Counseling, and School Counseling and Consultation. Her research interests are in the areas of adolescent counseling, urban school counseling, early parental attachment and later adult adjustment, and college student adjustment.

Terence Patterson
University of San Francisco

Terence Patterson is Professor at the University of San Francisco. He is a licensed psychologist and is board certified in family psychology with the American Board of Professional Psychology and a Fellow of the American Psychological Association. He is on the board of *The American Journal of Family Therapy*, a reviewer for *Professional Psychology: Research, & Practice*, and senior consulting editor for the APA bulletin *The Family Psychologist*. He is author of *The Couple & Family Clinical Documentation Sourcebook* and *The Comprehensive Handbook of Psychotherapy (2nd ed., Vol. 2—Cognitive-Behavioral)*. He is currently active in promoting diversity and competence in specialty areas in psychology.

Jean Sunde Peterson
Purdue University

Jean Sunde Peterson, PhD, is Associate Professor in the Department of Educational Studies at Purdue University and coordinates school-counselor preparation. Her research has focused on underidentified and understudied populations of gifted children and adolescents, with particular attention to underachievement, bullying and other trauma, homosexuality, and giftedness as a risk factor. She is currently the chair of the Counseling & Guidance Division of the National Association for Gifted Children. She has published 70 books, articles, and chapters, including 3 books on group work with teens.

Stephanie T. Pituc
University of San Francisco

Stephanie T. Pituc, MA, MEd, earned her baccalaureate degree in psychology from Northwestern University in Evanston, Illinois. She earned a Master of Arts and Master of Education in psychological counseling from Teachers College, Columbia University. She is currently affiliated with the University of San Francisco, School of Education's Department of Counseling Psychology. Stephanie's clinical work and teaching experience include high school, community college, and university populations in the New York City area. Her research interests include multicultural counseling, interpersonal dynamics, Asian immigrant populations, cultural adaptation and acculturation, and racial/ethnic identity.

Stacie E. Putman
Tennessee State University

Stacie E. Putman, EdD, is Assistant Professor in the Graduate Program in School Counseling in the Psychology Department at Tennessee State University. Her research interests include posttraumatic stress disorder among sexually victimized children, multicultural counseling issues, and issues related to juvenile sexual offenders. Dr. Putman is a licensed professional counselor/mental health service provider in the state of Tennessee. Her publications include articles appearing in *The Journal of Counseling & Development*.

John L. Romano
University of Minnesota–Twin Cities

John L. Romano is Professor of educational psychology in the Counseling and Student Personnel Psychology Program at the University of Minnesota–Twin Cities. He received his PhD from Arizona State University. He was a core faculty member on the evaluation team that assessed the outcome and impact of the national *Transforming School Counseling Initiative*, originally supported by the Wallace–Reader's Digest Fund in partnership with the Education Trust. He has also conducted workshops and research with preK–12 school personnel on models to enhance student well-being. His current research interests include applying principles and concepts of prevention to counseling and applied psychology and international psychology.

Michael B. Salzman
University of Hawaii at Manoa

Michael B. Salzman, PhD, is Associate Professor in the Department of Counselor Education at the University of Hawaii at Manoa. He has worked with diverse populations as a teacher in an inner-city public school district in Brooklyn, a school counselor in the Navajo Nation, with Alaska Natives in a model rural mental health program, with the Native Hawaiian Leadership Project in Hawaii, and as a psychologist at a community mental health center in South Tucson, Arizona. Dr. Salzman has developed interests in the psychological functions of culture, cultural trauma, consultation, indigenous psychologies, movements of cultural recovery, ethno-cultural conflict, and the processes of psychological decolonization.

Barbara A. Scarboro
Appalachian State University

Barbara A. Scarboro, PhD, is Assistant Professor in the Human Development & Psychological Counseling Department at Appalachian State University. Previously, she worked in the public schools of North Carolina as a substance abuse prevention coordinator, student assistance program counselor, and professional school counselor. Her current research interests include mental health reform, professional school counseling, professional development; counseling students with emotional and behavioral challenges; substance abuse prevention, intervention, treatment and dual diagnosis; group counseling; and multiculturalism and diversity issues. She is a National Certified Counselor, Licensed Professional Counselor, Licensed School Counselor, Licensed Clinical Addictions Specialist, and Case Presentation Method Evaluator for the North Carolina Substance Abuse Professional Practice Board.

John J. Schmidt
East Carolina University, Greenville

John J. (Jack) Schmidt, PhD, is Executive Director of the International Alliance for Invitational Education and professor emeritus of counselor education at East Carolina University, Greenville, North Carolina. This year, Jack is a visiting professor at Wake Forest University. In addition to service as a university professor, Jack has been a social studies teacher; an elementary, middle, and high school counselor; a school system director of counseling and testing; and the state coordinator of school counseling with the North Carolina Department of Public Instruction from 1985 until 1989. Author of over 50 articles, professional manuals, book chapters, and book reviews, Jack has published more than a dozen books.

Jonathan P. Schwartz
University of Houston

Jonathan P. Schwartz, PhD, is a licensed psychologist and Assistant Professor in the Counseling Psychology Program at the University of Houston, Department of Educational Psychology. His research interests include prevention, intimate violence, and gender roles. He is the current Communication Officer for the American Psychological Association Division 17 Prevention Section and is the editor for the Section's publication, "Prevention in Counseling Psychology: Theory, Research, Practice and Training."

Shelby J. Semino
Fordham University

Shelby J. Semino, MEd, is a doctoral candidate in counseling psychology at Fordham University in New York City. She received her Bachelor of Science degree in human service studies from Cornell University and obtained her Masters of Education degree in psychological counseling from Teachers College, Columbia University. At this time, Semino is completing her psychology internship training at the Child and Family Institute of St. Luke's-Roosevelt Hospital Center. Simultaneously, she is working on her dissertation, which focuses on the psychological impact of racial and sexual identity development processes among nonheterosexual Black women.

Heather L. Servaty-Seib
Purdue University

Heather L. Servaty-Seib, PhD, a counseling psychologist, is Assistant Professor in the Department of Educational Studies at Purdue University and teaches graduate-level courses on counseling theories, group counseling, and children and death. Her research interests include a broad range of areas within the field of thanatology, with particular emphasis on adolescent grief and social support offered to the bereaved. She maintains a small private practice, counseling children, adolescents, and adults who are struggling with loss issues. Dr. Servaty-Seib has held a number of leadership positions, including Second Vice President, in the Association for Death Education and Counseling.

Amanda B. Siebecker
University of Nebraska–Lincoln

Amanda B. Siebecker, MA, is a fifth-year doctoral student in the School Psychology program at the University of Nebraska–Lincoln. She is the President-Elect of Student Affiliates in School Psychology (SASP). In addition, Amanda is a student-editor for *School Psychology Quarterly*. Her research interests include issues related to the measurement of bullying, the role of special education verification in bullying and victimization, and the identification of effective prevention and intervention programs for schools and communities.

Melissa Kraemer Smothers
University of Wisconsin–Milwaukee

Melissa Kraemer Smothers, MA, is a doctoral candidate in the counseling psychology program at the University of Wisconsin–Milwaukee. She graduated from Boston College with a master's degree in counseling psychology. Her research interests include supervision and psychotherapy process and multicultural counseling. She currently teaches in the areas of counseling theory and group counseling, as well as supervising master's level students in practicum.

V. Scott H. Solberg
University of Wisconsin–Madison

V. Scott H. Solberg, PhD, is Director of Wisconsin Careers in the Center on Education and Work at the University of Wisconsin–Madison where he is also a member of the faculty of the Department of Counseling Psychology. From 1995 to 2006, Dr. Solberg served as Associate Professor of educational psychology at the University of Wisconsin–Milwaukee. His primary work has focused on improving school classroom settings through intervention programming designed to promote a number of resilience characteristics including academic self-efficacy, motivation, positive relationships, stress management, and health. His intervention work has been published recently to be available to schools as *Success Highways* by ScholarCentric publishing.

Robbie J. Steward
Michigan State University

Robbie J. Steward, PhD, is Professor and Director of the Michigan State University Master's Counseling Program, whose training and teaching foci include the development of trainees' basic individual and group counseling skills and self-efficacy, appropriate selection and implementation of counseling strategies and consultation skills, and research competence. Her research specialty areas are multicultural counseling development, counseling supervision, the identification of trainees' cognitive and academic background and personal characteristics that influence optimal training outcomes in terms of counselor competence and self-efficacy, and the identification of variables that influence academic persistence in both K–12 and university settings.

Susan M. Swearer
University of Nebraska–Lincoln

Susan M. Swearer, PhD, is Associate Professor of school psychology in the Department of Educational Psychology at the University of Nebraska–Lincoln. She is the codirector of the Nebraska Internship Consortium in Professional Psychology and is a licensed psychologist in the state of Nebraska. Her research interests are in the areas of bullying prevention and intervention, comorbidity of internalizing and externalizing disorders, and cognitive-behavioral interventions for youth and their families. Dr. Swearer is Associate Editor for *School Psychology Review* and is on the editorial boards of *School Psychology Quarterly* and *Journal of Anxiety Disorders*.

Edison J. Trickett
University of Illinois at Chicago

Edison J. Trickett, PhD, is currently Professor of psychology and Chair of the Community and Prevention Research Division in the Psychology Department at the University of Illinois. Throughout his career, his research has focused on the development of an ecological perspective for conducting community research and intervention. His empirical work has focused on how to assess the social environments of public schools and their effects on adolescent development. In the past 15 years, the emphasis has been on the role of the schools in the acculturation and adaptation of immigrant and refugee adolescents and families. His current work focuses on school contributors to burnout among ESL and bilingual high school teachers.

Kay Herting Wahl
University of Minnesota–Twin Cities

Kay Herting Wahl, PhD, has been involved in school counseling training programs in several university programs, including in South Dakota, Iowa, Nevada, and Minnesota. She is a former school counselor, working at all three levels of education: elementary, middle, and secondary. She is currently involved in a federal grant that has hired school counselors in elementary schools in the inner city and a suburban school district to complete a comparison on the effectiveness of comprehensive programming by the school counselor.

Mary E. Walsh
Boston College

Mary E. Walsh, PhD, the Daniel E. Kearns Professor of Urban Education and Innovative Leadership in the Department of Counseling, Developmental and Educational Psychology at the Lynch School of Education at Boston College, directs the Boston College Center for Child, Family, and Community Partnerships. For the past several years, Dr. Walsh has been a lead partner in a school–community–university partnership among Boston College, the Boston Public Schools, and community agencies. This partnership, known as Boston Connects, addresses barriers to learning and promotes academic achievement by enhancing the school climate and the student support process for the school community and improving health and mental health resources for student and their families.

Laurie L. Williamson
Appalachian State University

Laurie L. Williamson, PhD, is a counselor educator and Professor in the Department of Human Development and Psychological Counseling and the Coordinator of the Professional School Counseling Program at Appalachian State University. Her clinical background is in medical social work, residential treatment, and mental health services. She has worked as a professional school counselor for 10 years, including in two international settings. As a counselor educator, her interests include school counseling, diversity, supervision, and career counseling.

Patricia L. Wolleat
University of Wisconsin–Madison

Pat Wolleat is a professor emerita from the Department of Counseling Psychology at the University of Wisconsin–Madison. She received her PhD from the University of Minnesota in 1971 and a law degree from the University of Wisconsin in 1987. She began her professional career as a seventh-grade English/social studies teacher. At the University of Wisconsin, she pursued research and teaching interests in law and ethics, clinical supervision, and career development of girls and women. She has supervised many school counseling practicum students and interns and published several articles in *The School Counselor* and *Elementary School Counseling and Guidance* journals.

Chris Wood
The Ohio State University

Chris Wood, PhD, NCSC is currently in the Counselor Education Program at The Ohio State University. He taught previously at the University of Arizona and has been on the editorial review board of *Professional School Counseling* for many years. He has authored numerous articles and book chapters advancing the field of school counseling. A nationally certified school counselor (NCSC), he has experience as a counselor educator, a high school counselor, and a counselor/group leader at a residential youth facility for troubled teens.

A. Yang
University of Minnesota–Twin Cities

A. Yang is a doctoral student at the University of Minnesota–Twin Cities. She received her Masters of Science from the University of Wisconsin–Madison. Her research interests can be encompassed under multicultural counseling, as it relates to promoting healthy psychological adjustment among culturally diverse groups through theory, research, and practice. For example, previous research topics of interest included studying racial/ethnic collective self-esteem; ethnic support network, and its influence on interracial dating and marrying; and cultural identity as a resiliency factor. Currently, she is investigating characteristics of counselors and therapists who encompass more ethno-relative worldviews and thus a greater capacity toward intercultural sensitivity competence.

Christine J. Yeh
University of San Francisco

Christine J. Yeh, PhD, is Associate Professor of counseling psychology and Coordinator, Educational Counseling/PPS Credential Program at the University of San Francisco. From 1998 to 2006, she was a Professor and Coordinator of the School Counseling Specialization at Teachers College, Columbia University. Her interests include developing school-based intervention programs for culturally diverse and immigrant children and youth and facilitating school counselor collaborations with teachers, staff, and outside agencies and organizations. She is currently Principal Investigator of a 5-year NIMH grant examining the cultural adjustment, academic achievement, and mental health of recent immigrant students. She is on the editorial boards of *Journal of Counseling Psychology* and *Training and Education in Professional Psychology*.

Elias Zambrano
University of Texas at San Antonio

Elias Zambrano, MA, is a doctoral student at the University of Texas at San Antonio, Counselor Education and Supervision. He is a retired certified school counselor, having worked as a professional school counselor for 28 years. During that time, he also served as the Safe and Drug Free Schools and Communities Program Coordinator and then Director of Guidance Services for Northside Independent School District in San Antonio.

SCHOOL COUNSELING FROM A MULTICULTURAL AND AN ECOLOGICAL PERSPECTIVE: An Introduction

HARDIN L. K. COLEMAN
University of Wisconsin–Madison
CHRISTINE J. YEH
University of San Francisco

As counseling psychologists, we (the editors) are committed to positive youth development, educational equity, and social justice. We seek to prepare school counselors who will help students become effective citizens in a democratic and pluralistic society through integrating theory, science, and practice in school counseling. We wanted to create a handbook for professional school counselors and counselor educators that reflects these commitments while contributing to the growing field of school counseling. This was an incredibly challenging and ambitious task that, due to the high quality of chapters created by our contributors, has been accomplished.

In planning the *Handbook of School Counseling*, we realized that today's schools are under pressure to meet the needs of an increasingly diverse student body. For example, in large cities such as New York City, only 15.3% of public school students are racially identified as White (Young, 2002). Across suburban, rural, and urban public schools in the United States, more than one third of students are from racial minority groups and this number continues to grow (Hoffman, 2000).

Due to the increasing diversity of school-aged children and youth, schools offer a unique and critical context for understanding multiple aspects of student development including race, disability, sexual orientation, social class, and linguistic differences. Specifically, in the past few decades, immigrants are the fastest growing and most culturally diverse group of school-aged children and youth in the United States (Zhou, 1997). In terms of linguistic diversity, 31% of all American Indian/Alaska Native, Asian/Pacific Islander, and Latino/a students enrolled in U.S. public schools speak English as a second language (U.S. Department of Education, 1996). Moreover, the percent of students at the poverty level continues to remain high (Fix & Capps, 2002; National Center for Children in Poverty, 2002). Due to the high costs of individual counseling, cultural stigmas, and other cultural barriers to mental health services, school counselors are an optimal choice for addressing socioemotional issues and fostering positive student development. Similarly, school counselors' daily contact with youth affords them opportunities to address many everyday issues facing students including academics, career development, literacy, interpersonal relationships, and sexual and physical health.

Understanding and incorporating multiculturalism in school counseling requires an appreciation of the range of values, customs, behaviors, and lifestyles represented within a school context (Kim & Yeh, 2002) and in the surrounding communities. Culturally diverse children and youth must learn to negotiate multiple sets of norms and identities across numerous social systems. Students experience challenges when they are expected to function and achieve according to the norms and goals of the "dominant culture" (Yeh, 2004). Helms (1990) defined the dominant culture as White European American with power and wealth. Because racialized interactions occur at multiple levels across various systems (Helms, 2003), school counselors with White privilege must explore and understand the influence of this power in the school setting and in their direct and indirect interactions with students (see Yeh & Pituc, this volume).

Children and youth are developing in a society that is undergoing a significant change because of the industrial revolution when schools transitioned from single-room houses in agrarian communities to comprehensive high schools in urban areas, followed by the consolidation movement across the United States in the 1960s and 1970s. Such shifts, in an increasingly multicultural society, mandate changes in the how we envision the role of the professional school counselor—a role that has evolved

in the past three decades and will continue progress in the immediate future. There are also dramatic changes in technological advances that introduce a host of new challenges as well as resources for students and school counselors that are unprecedented. In this *Handbook*, we try to address the most current and pressing societal concerns and offer numerous current resources.

We hope that this *Handbook* can serve as a support system for school counselors as they move from the end of their preservice training and through the first 5 years of their professional career. We also hope that students, school counselors, school staff, counselor educators, and counseling psychologists will use the *Handbook* in their training and research as well as in program development and evaluation. Educational and psychology-based researchers may also use this *Handbook* as a guide for conducting research in school settings. In addition, many social systems that collaborate and interact with schools and students (e.g., families, community agencies, psychologists) may use this *Handbook* as a valuable resource for various student issues.

Most textbooks that specifically address the needs of school counselors tend to focus on understanding the history of the profession and the roles that school counselors take within the schools. Many textbooks provide specific techniques without providing the relevant conceptual, cultural, and scientific context. Certainly, our chapters provide specific skills, techniques, and discussions of roles. However, we also wanted to integrate critical issues related to child and adolescent development, positive youth development, diversity (in terms of ethnic, racial, cultural, geographic, gender, grade level, sexual orientation, ability, etc.), urbanization and immigration, social justice, and school-based interventions all within an ecological systems perspective (for an overview, see Bronfenbrenner, 1989, 1994).

The Organization and Overview of the Handbook

The Handbook consists of 48 chapters and it is divided into seven sections: Introduction to the Field of School Counseling, Diversity and School Counseling, Student Development, School Counselor Competence, School-Based Interventions, Working with Socioemotional Challenges, and Accountability and Professional Issues in School Counseling. We asked each contributor to include the most relevant current and past theory, research, and practice and to provide multicultural and contextual perspectives that include diversity in terms of ethnicity, race, sexual orientation, disability, social class, geographic location (e.g., rural, suburban, and urban) and grade level (e.g., elementary, middle school, and high school). We also asked contributors to highlight the connection between research and practice in relation to their topics. Because so many of our contributors have extensive experience in school settings (school counselors, school psychologists, program developers/evaluators, etc.), they were able to integrate their practical expertise in the chapters through case studies, examples of interventions, and student quotes. Many chapters also include discussion questions; suggestions for readings, videos, Web sites; and other resources for further development.

The first section includes five chapters and is an introduction to and overview of the field of school counseling. This section addresses the history of school counseling (Schmidt), the concept of "best practices" in school counseling (Steward, Neil, & Diemer) and a discussion of the development and implementation of National Standards in School Counseling (Dahir). In addition, our commitment to multiculturalism and context is underscored in chapters on student accomplishment and equity (Coleman) and in a chapter exploring school counselor worldview and cultural background as critical factors in training, practice, and research (Yeh & Pituc). This section lays the groundwork for more in-depth discussion of the role of diversity in the school setting.

The second section, Diversity and School Counseling, consists of nine chapters all dedicated to examining the important role of multiculturalism in our schools. The notion of multiculturalism is broadly defined and includes issues related to immigration, acculturation, racism, racial identity, ethnic identity, sexual orientation, social class, disability, and empowerment. These critical aspects of diversity are considered intersecting, dynamic, multidimensional, and contextually situated. For example, Edison Trickett and Diana Formoso's chapter, "The Acculturative Environment of Schools and the School Counselor: Goals and Roles That Create a Supportive Context for Immigrant Adolescents" provides an ecological perspective on immigrant youth development and interactions in schools. They discuss the reciprocal and complex nature of students' social systems (e.g., peers, family) as significant acculturative contexts. The chapter "Racial Harassment in American Schools" by Robert Carter, Tamara Buckley, and Schekeva Hall explores social, political, and institutional practices and policies that function as a basis of racial assumptions and beliefs. Issues of White privilege are examined at multiple levels (e.g., individual, school) across various structures (e.g., educational and political practices) to provide a context for understanding the systemic underpinnings of the racial harassment of students of color. Similarly, other chapters in this section are dedicated to helping school counselors address oppressive practices in schools and build a climate prioritizing equitable conditions and interactions.

The third section, Student Development, includes five chapters that incorporate major issues facing school-aged children and youth as they navigate through childhood and adolescence. There is a strong focus on the ways in which school counselors can promote positive youth development and health. The authors advocate for collaborative school counselor relationships with teachers, school staff, families, and communities to foster student development in areas such as literacy, career, and physical health. Further, as indicated in the chapter "Designing Culturally Responsive School Counseling Career Development Programming for Youth" (Howard, Solberg, Kantameni, & Smothers), positive development must be considered within its relevant cultural and social context.

The fourth section, School Counselor Competence, consists of five chapters that focus on the training, development, supervision, and practice of competent school counseling. Using a contextual and multicultural perspective, the authors view competence as not just an individual construct, but an integral aspect of counseling that involves teachers, administrators, counseling agencies, training programs, and supervisors. For example, as Jennifer Lindwall and Hardin Coleman discussed in their chapter, "The School Counselor's Role in Creating Caring Communities," competence entails the creation and development of caring school communities, not just individual counselors.

The *Handbook*'s strong systemic approach is further underscored by the fifth section, School-Based Interventions. This section includes 11 chapters that range from examples of preventative intervention ("Youth Development and Prevention in the Schools," Hage, Schwartz, & Barnett) to "Crisis Management in the Schools" (Murphy). Multiple ecological levels are addressed including individuals, groups, and families. Given the high student-to-school counselor ratio, it is essential that we consider alternatives to the one-on-one counseling model. Given our strong multicultural focus, we also include chapters that provide various models of interacting with students (e.g., "Creative Arts Counseling in Schools: Toward a More Comprehensive Approach," Clauss-Ehlers) as well as different issues that can be addressed programmatically, such as the enhancement of cultural identity (Coleman, Cho Kim, & Yang).

The sixth section, Working With Socioemotional Challenges, includes seven chapters that highlight some of the most current challenges facing our schools and ways that school counselors can address these issues. Many of these issues create barriers to positive youth development and must be confronted systemically. For example, Susan Swearer, Eric Buhs, Amanda Siebecker, Kelly Brey Love, and Courtney Miller provided the most current research, theory, and practical offerings on the growing problem of bullying and peer victimization in our schools. Anne Gregory and Elise Capella discussed school violence from an ecological systems perspective examining the continuous and reciprocal interactions between individuals and contexts (e.g., the role of neighborhoods, families, and school policies). Karen Cort's chapter, "Working With School Failure," describes the racial and cultural contexts that are associated with school failure from an ecological perspective and challenges the discrete, unitary diagnostic category of an individual as being solely responsible for "failure."

The final section, Accountability and Professional Issues in School Counseling, includes five chapters focused on some of the most pressing professional issues that school counselors face and various laws and ethical issues that influence the role of the school counselor (see Wolleat, Chapter 46). This section examines issues of accountability by discussing how we evaluate school counseling programs (e.g., see Gysbers, Chapter 43) and the role of research in and on school counseling (see Kim & Alamilla, Chapter 44). Our commitment to integrating the science and theory of school counseling with practice is further highlighted in the chapter, "Professional Activities in School Counseling" by Keith Davis, Laurie Williamson, and Barbara Scarboro.

Hopes for the Handbook of School Counseling

We have several additional hopes for this *Handbook*. Our first hope is that, along with the journal, *Professional School Counseling*, the American School Counselor Association (ASCA), the efforts of the Educational Trust and the Transforming School Counseling Initiatives, and the work of counselor educators and school counselors across the country, this *Handbook* serves to highlight the importance and value of school counselors within the schools and in the field of counseling psychology. There are many challenges in modern education from school violence to the student achievement gap among many ethnic minority groups. School counselors must work collaboratively and systemically to prepare students to take on positive roles as citizens in a global economy. They must provide leadership in a culturally relevant comprehensive guidance and counseling program in order to foster positive youth development. Presently, the relationship between school counseling and counseling psychology has failed to live up to its full potential for collaboration (Romano & Kachgal, 2004).

Our second hope is that the material in this *Handbook* will help stimulate the integration of science into the practice of school counseling. To date, research and practice in school counseling have often occurred in two separate and distinct conversations. Part of this disconnect is shaped by the structure of training programs (Coleman, 2004) and the difference between the focus on research in doctoral level training in counseling psychology versus the focus on practice in master's degree level training in

school counseling (Yeh, 2004). In addition, the scholarship and research associated with key topics in school counseling is spread across multiple disciplines (e.g., emotional intelligence, social competence, vocational psychology; Coleman, 2004).

Although there are numerous opportunities for multicultural research and practice in schools (Romano & Kachgal, 2004), the current research in counseling psychology does not adequately reflect school age populations (Yeh 2004). Romano and Kachgal asserted that school counseling has the potential to contribute unique research opportunities in terms of its emphasis on action research, qualitative methods, and developmental-contextualism. However, because doctoral students and their mentors in Counseling psychology programs tend not to specialize in School counseling research, few dissertations and later research activities address school counseling issues (Yeh, 2004). In this *Handbook*, school-based research, which incorporates an ecological systems perspective (Bronfenbrenner, 1989, 1994; Trickett & Schmid, 1993), is embedded throughout various chapters.

Our third hope is that this *Handbook* will provide guidance for greater collaboration between school counselors, other student pupil services professionals, teachers, and community members. According to the ASCA Delegate Assembly (2003),

> School counselors work with all students, including those who are considered at-risk and those with special needs. They are specialists in human behavior and relationships who provide assistance to students through four primary interventions: counseling (individual and group), large group guidance, consultation, and coordination. (¶ 1)

In order to serve as advocates for students, school counselors must work to ensure equal access to desired and necessary services. Hence, school counselors must collaborate to offer groups, outreach services, and programs in school and community settings.

Consistent with the ecological systems perspective (Bronfenbrenner, 1989, 1994; Trickett & Schmid, 1993), school counseling can greatly benefit not only from research that incorporates a systemic approach but also from practice applications as well. Specifically, ecological systems theory fosters our understanding of influences on children's and adolescents' psychological and emotional functioning across multiple contexts and helps shape relevant counseling approaches. Ecological settings are a group of reciprocal and interacting systems (Bronfenbrenner, 1994) that must be incorporated into current school counseling practices. Because many school-aged youth utilize differing coping strategies depending on their situation and environment (Coleman, Casali, & Wampold, 2001), school counseling practice must also involve important relationships for children and youth.

Colbert and Magouirk Colbert (2003) discussed the change from the individual focus in school counseling to the larger educational system as part of a necessary "culture-centered education reform" (p. 3). This framework is useful because it conceptualizes the role of the school counselor as a student advocate, organizational change facilitator, and consultant (Colbert & Magouirk Colbert) and removes the naïve perception that the individual student is accountable for the problems in a school setting. Along these same lines, we assert that school counselors must consider their role in the larger context of social justice and see their roles in fostering social, cultural, and institutional change. The chapters in the *Handbook* strive to meet this vision of the role of the school counselor.

Our fourth hope of the *Handbook* is that it will encourage school counselors and mental health practitioners in schools to use the principles of social science to guide and evaluate their practice. Moreover, we hope the *Handbook* will enhance and validate their identities as scientist-practitioners. Our contributors help us realize this goal by including recent research findings, critical theoretical perspectives, and the most pertinent clinical applications. Moreover, these chapters discuss the *links* that connect research, theory, and practice so that practicing school counselors may better understand the role of research in their everyday work. Similarly, training programs may better explain and validate this important connection through education and scientific inquiry.

The *Handbook* fulfills the vision of the editors and the numerous contributors and provides a clear agenda for research, practice, training, and practice in the growing, yet evolving field of school counseling.

Introduction to the Field of School Counseling

I
HISTORY OF SCHOOL COUNSELING

JOHN J. SCHMIDT, EdD
East Carolina University

School counselors are members of an expanded profession of practitioners who work in a variety of settings, including mental-health centers, family clinics, military services, hospitals, businesses, schools, and colleges among others (Gladding, 2000; Nugent, 2000; Schmidt, 2008; Vacc & Loesch, 2000). Within this burgeoning field of professional counseling, school counseling is a specialty field that has its roots in the vocational guidance movement of the Industrial Revolution during the late 19th and early 20th centuries (Gysbers & Henderson, 2000; Schmidt; Studer, 2005).

This first chapter of the *Handbook of School Counseling* provides an overview of the historical development of the school counseling profession, highlights the role that counselors have played in student development, and offers a brief synopsis of professional issues and trends that have had an impact on the practice of counseling in schools. By understanding historical influences and the emerging role of school counselors in American education over the past hundred years, a future school counselor or administrator can attain greater appreciation for the vital role that counselors will have in our 21st century schools.

In previous books and articles, Schmidt (2004, 2008) argued that, although school counselors serve students, parents, and teachers with seemingly dissimilar missions than their colleagues who practice in mental health, family clinics, or other arenas, all counselors are united professionally by criteria of preparation and standards of practice. These criteria and standards include a basic understanding and command of helping skills and techniques; a broad knowledge of psychological, sociological, and human development theories; an appropriate level of training in assessment, diagnosis, and intervention; and an appreciation of common goals and objectives that bring together counselors from a variety of specialty work settings as colleagues in the broader counseling profession. Before exploring the history of school counseling as a professional specialty, it is appropriate that we first take a brief glance at the counseling profession.

The Counseling Profession

The exact beginning of the counseling profession is unknown, but its roots may be found in a range of helping relationships that have spanned cultures and societies throughout the ages. In most instances, helping relationships that existed within early cultures and societies encouraged the development of young people and their acquisition of personal traits, social acceptance, and survival skills (Schmidt, 2008).

Numerous historical events, such as the U.S. Industrial Revolution, led to the emergence of professions to help people with social, personal, and vocational concerns. These professions include the fields of social work, psychology, psychotherapy, and counseling among others, and the theories of practice adopted and developed by the counseling profession have roots in the scholarly research and practical guidelines established during the 19th and 20th centuries.

> As a result, the counseling profession relies on a broad knowledge of human development, psychology, sociology, and education. At the same time, it incorporates effective communication and leadership skills with the essential human qualities of caring, genuineness, regard, and respect for others. (Schmidt, 2008, p. 5)

The counseling profession evolved from traditions and practices to help people formally assess their needs, design interventions, and provide services to assist people

in identifying issues, developing self-awareness, making life-altering decisions, solving problems, and establishing healthy personal and social relationships. As such, professional counselors in a variety of work settings provide a range of services to help clients maximize their development and human potential, examine ways to prevent barriers or obstacles to their development, and alter behaviors or life situations that cause problems. In summary, professional counselors form different types of helping relationships and provide other services to assist clients in *preventing* future difficulties, *developing* optimal human potential, and *solving* problem situations.

The counseling profession is primarily represented and promoted by the American Counseling Association (ACA) and its many divisions, including the American School Counselor Association (ASCA). These organizations have guided the development of the counseling profession, established standards of preparation, set criteria for certification and licensure, and developed ethical guidelines and standards of professional practice for counselors. At the same time, other helping professions also use counseling processes in their roles. Social workers, psychologists, and psychiatric nurses are among those who apply processes similar to those used by counselors in mental-health centers, family clinics, prisons, hospitals, and schools.

The growth of all of these helping professions in the United States is largely due to social and economic changes during the 18th and 19th centuries that raised concern about personal, social, career, and educational development among young people. In another book, Schmidt (2008) commented,

> Because the U.S. prides itself on democratic principles, equal opportunity, and human service, it is understandable how so many related helping professions could emerge. In particular, it is especially clear why counselors have played such an important role in our schools, which themselves incorporate principles of democracy, equity, and opportunity for all students. (p. 6)

Within this framework of helping students develop their potential by accessing opportunities for personal, social, and education development, we introduce the school counseling profession and its attention to student development.

School Counseling and Student Development

School counselors work in elementary, middle, or high schools across the United States, and today the profession is expanding to many other countries throughout the globe. These counselors matriculate in counselor education programs that stress human development, helping skills, and professional practice in school environments. As noted earlier, this educational focus is what links school counselors and other counselors as colleagues in an expanded counseling profession.

Before the 20th century in American schools, classroom teachers provided guidance to students for their social, personal, vocational, and in many cases, spiritual development. Most historical summaries point to the U.S. Industrial Revolution as the significant event or period during which the school counseling profession emerged as the guidance movement at the beginning of the 20th century (Schmidt, 2008; Sciarra, 2004). Some unfortunate consequences of the industrial growth of this era were urban blight, challenges of city life, and creation of ethnic ghettos. At the same time, industrial growth contributed to a factory mentality that frequently neglected or overlooked individual rights, freedom, and human value. In response to these conditions, some educators and social activists proposed programs and services to help students with their development, in particular with vocational aspirations and choices brought about by the change from an agrarian to an industrial society (Schmidt, 2008).

Emphasis on vocational guidance was an important part of this early response to industrialization. As one example, George Merrill began experimental efforts in vocational guidance at the California School of Mechanical Arts in San Francisco in 1895 (Miller, 1968). He proposed vocational experiences for students to explore occupational trades taught at the school and, in addition, offered counseling and job placement services to complement vocational experiences. In addition to vocational exploration, the guidance movement of the early 20th century helped students with their moral development, social skills, and interpersonal relationships. Leaders of this early guidance movement included Jesse B. Davis in Michigan, Frank Goodwin in Ohio, Anna Reed in Washington, Frank Parsons in Massachusetts, and Eli Weaver in New York.

Although his work did not focus directly on students in schools, Frank Parsons, also known as the "Father of Guidance," is considered to have started the guidance movement in the United States (D. Brown & Trusty, 2005; Gladding, 2000; Schmidt, 2008). In 1908, he established the Boston Vocational Bureau to assist young men in choosing their careers. Through his work with the bureau, Parsons focused on vocational development by helping young men make the career transition from high school to the world of work. Parsons (as cited in Schmidt) wrote a book, *Choosing a Vocation,* published after his death, in which he presented three essential factors for selecting a vocation: (a) clear self-understanding of one's aptitudes, abilities, interests, resources, and limitations; (b) knowledge of

the requirements, advantages, disadvantages, and compensation for different types of employment; and (c) an understanding of the relationship between these two groups of facts.

As previously noted, this early guidance movement spread to many other states and cities across the United States including New York City, Grand Rapids, Seattle, and Cincinnati. Within a few short years, city school systems across the country had developed guidance programs. As an example, in 1889, before Frank Parsons created the Vocation Bureau, Jesse B. Davis established a guidance program in the curriculum of the public schools of Michigan (Gladding, 2000; Schmidt, 2008; Wittmer, 2000). From 1898 to 1907, Davis was a class counselor at Central High School in Detroit, Michigan, and was responsible for educational and vocational counseling with 11th-grade boys and girls. Named as principal of a high school in Grand Rapids, Michigan, in 1907, he soon established a schoolwide guidance program by having English teachers integrate into their classes guidance lessons for helping students acquire positive traits, choose appropriate behaviors, and address their vocational interests (Schmidt). Davis's work preceded other guidance programs established across the country. Anna Reed led the development of systematic vocational guidance in Seattle, Washington. Similarly, in 1908, Eli Weaver achieved national notoriety for his efforts at the Boys High School of Brooklyn to establish the first guidance services in New York City, and in 1911, Frank Goodwin organized a system-wide guidance program for the Cincinnati, Ohio, schools (Gibson & Mitchell, 1999; Miller, 1968; Schmidt). The focus of these guidance programs on student development formed the early years of what we know today as the school counseling profession. It is noteworthy that the school counseling profession throughout the years has continually addressed aspects of student development. The next several sections of this chapter chronicle that movement and emphasis.

Vocational Development

The early guidance movement of the 19th and 20th centuries gained strength from the founding of the National Vocational Guidance Association (NVGA) in 1913. One of the most significant activities of this organization was to publish the *National Vocational Guidance Bulletin*, which spread news and trends about the vocational guidance arena. Eventually, this publication would become the *Career Development Quarterly*, today published by the National Career Development Association (NCDA).

The early NVGA focused on vocational choice and career development, but its enduring legacy is the unification of counselors across a wide spectrum and the eventual identification of what today has become the counseling profession. During the next 3 decades and into the 1950s, many national and world events would give direction and momentum to the emerging counseling profession, particularly for counseling in schools. Related to this emphasis on vocational development was the country's growing interest in measurement and assessment of human traits and aptitudes. This interest increased dramatically during World War I, when the military began using assessments to screen and classify recruits and draftees.

Assessment and Vocational Development

Intelligence testing, first developed in the beginning of the 20th century, sparked interest in measuring human potential and other traits, and using results to place people in vocational tracks. The U.S. army adapted the work of French psychologist, Alfred Binet, later expanded by Arthur Otis and Lewis Terman, to create assessment procedures. A group intelligence test, developed by Arthur Otis (Miller, 1968), led to the military's *Army Alpha Examination* and the *Army Beta Examination* (Baker & Gerler, 2004). What followed was a proliferation of tests developed and marketed over the next decade, but many of these instruments were flawed due to inadequate design and inappropriate standardization processes (Schmidt, 2008):

> Nevertheless, the military's interest in using group measurement techniques was embraced by schools and the education profession when the war ended. The potential for applying testing and other measurement techniques to pupil assessment helped catapult the development and expansion of standardized testing in U.S. schools. (p. 9)

The testing movement contributed to the development of approaches to guidance and counseling that focused on measurement of students' traits and characteristics in the process of selecting vocational goals and planning career directions. As one example, E. G. Williamson, a professor at the University of Minnesota, promoted the perspective of a *directive* or *counselor-centered* approach to school counseling. In 1939, Williamson wrote that a school counselor should state his or her "point of view with definiteness, attempting through exposition to enlighten the student" (p. 136). Although he softened this view somewhat in later years (Schmidt, 2008), Williamson's direct approach continued through the 1950s to caution counselors about giving students too much latitude in making decisions for themselves. During this time, Trait-Factor Theory, as his approach became known, grew in popularity. Williamson (as cited in Schmidt) maintained, "[T]he development of individuality on the part of students must be balanced with concern for self-destructive and antisocial behaviors,"

and "people achieve individual freedom through effective group membership, interdependence, and adherence to high social ideals" (p. 9).

The Trait-Factor approach to counseling presented six steps in the process (Williamson, 1950). These steps included (a) *analysis*, which was the collection information and data about students and their environments; (b) *synthesis* of pertinent data to better identify and understand students; (c) *diagnosis* or rationale for intervention; (d) *prognosis* or the prediction of results that most likely will occur as a consequence of students' behaviors; (e) *treatment*, which outlined different strategies and techniques counselors might use in assisting students; and (f) *follow-up* or the evaluation of the outcomes of students' plans of action. The structure that Williamson (1950) and his colleagues gave to the counseling process helped give some sense of identity to the profession. However, not all counselors or counselor educators believed that the attention placed on students' traits and characteristics, or the limited focus of vocational development and career choice, adequately defined the role of counselors in schools. To some, vocational development and career decision making were only part of the developmental spectrum challenging students in schools. The voices of these professionals gained an audience and, consequently, the emphasis on counseling students in schools began to acquire a wider lens for the profession.

Personal and Social Development

During the early 1900s and through the 1930s, the country witnessed a seesaw of attitudes and beliefs about education and about the role of guidance and counseling in schools. For example, as the work of early guidance pioneers, such as educators Jesse Davis, Anna Reed, Eli Weaver, and Frank Goodwin, began to bear fruit from their efforts, American education entered the *progressive era*. Proposed by educational philosophers, such as John Dewey and others, *progressive education* advocated the personal, social, and moral development of students and handed schools the responsibility for addressing these issues. This progressive movement was relatively short-lived. Criticism from teachers, parents, and other groups who believed progressive education was too permissive and lacked a sound educational basis resulted in lost momentum after a few years. Also weakened by the decline in funding for public education, exacerbated by the Great Depression, progressive education disappeared as a popular movement, and coincidentally, support for guidance activities and counseling services in the schools was seriously weakened during this time (Nugent, 2000).

Nevertheless, many authorities in the school counseling profession continued to question the narrow focus on vocational development. Some encouraged a broader focus to include issues related self-concept development and other equally important aspects of student development. This broader view laid the groundwork for many of the counseling theories and approaches created in the years to come.

The years leading up to America's involvement in World War II witnessed significant change in U.S. education and influences on the practice of guidance and counseling in schools. Among the influences on the school counseling profession and the preparation of school counselors was the notable work of Carl Rogers (1942, 1951). The direction Rogers gave to the counseling profession as a whole, and the recognition his work gave to the importance of personal development in people's lives was significant for counselors in all mental-health arenas including the schools. Rogers' work helped to move the counseling profession away from counselor-centered models toward more developmentally oriented helping relationships. For school counselors, Rogers' emphasis helped move the profession from strict informational-gathering, decision-making, and problem-solving approaches to services intended to meet broader developmental needs of an expanded student population.

During the next five decades, Rogers' contributions would continue to identify and define an emerging counseling profession. Not all voices, however, praised how his work influenced the practice of counseling in schools. For example, Wittmer (2000) argued that inordinate attention to the person "somehow took us off-track in school counselor preparation and may have contributed to the inappropriate training of many school counselors" (p. 3). Wittmer particularly noted that the extraordinary attention placed on individuals seemed to lead the school counseling profession to place undue emphasis on one-on-one and remedial services while neglecting preventive and developmental approaches that are so vital in school curricula.

Gysbers and Henderson (2000) also criticized the overemphasis placed on the counseling function. They noted that the strong emphasis on counseling services maintained the historical roots of pupil personnel services and corresponding organizational models that had emerged from the pre-WWI era and continued through the 1960s. These models, such as the clinical-services model, promoted great interest in students' personal development with the focus being on the counseling function and the school counselor rather than on guidance curricula and guidance programs (Gysbers & Henderson).

During the 1940s, the nation became embroiled in World War II and, with its allies, fought against Germany, Italy, and Japan around the globe. United States entry into this conflict once again raised the military's interest and use of assessment and selection processes to identify personnel for specialist training and placement. After the war, this interest expanded from military use to educational

testing and personnel screening in the business sector. As a result, the country saw an expanded use of assessment processes, which contributed to the growth of human services professions including counseling, psychology, and human resource development in business and industry (Gladding, 2000). This influence also affected the direction of school counseling services at this time and, furthermore, the attention that the federal government gave to this relatively new profession (Schmidt, 2008).

In 1946, the U.S. Congress passed the *George–Barden Act,* which allocated financial support for guidance and counseling services in schools. This legislation initiated the availability of funds and resources for state education supervisors, local school systems, and practicing school counselors. As Schmidt (2008) noted in another book, the available funds and resources from the *George–Barden Act* "fueled the start of a period of rapid growth for guidance and counseling services in schools" (p. 11). Simultaneously, rapid growth of the school counseling profession was complemented by various changes in government organization and oversight. Different federal and state offices under which school guidance and counseling was located and governed frequently changed names and organizational structure until the mid-1950s, when the Guidance and Personnel Services Section of the U.S. Office of Education was established. The direction provided by this office through the 1960s continued to emphasize areas of student development beyond the single focus on vocational development.

The next major world event to influence American education and the school counseling profession was the launching of the first unmanned satellite, Sputnik I, by the Soviet Union in 1957. This successful entry into the space age by an arch nemesis of the United States sounded a loud awakening in American politics and, simultaneously, rigorous debate about the ability of our educational system to prepare future scientists to compete in the race to space. The eventual fall out from the publicity, debate, and fear following the launch of Sputnik I was swift. Congressional action brought about significant change in educational direction and funding, both of which had tremendous impact on the emerging school counseling profession and greater emphasis on and attention to students' academic development.

Academic Development

Public fear, political criticism, and educational debate culminated in the passage of Public Law 85-864, called the *National Defense Education Act* of 1958 (NDEA). In sum, this bill provided direction and funding to improve assessment of student abilities, create systems for identifying students' potential (particularly in math, science, and foreign language) early in their school years, and encourage scholarships and other financial incentives to enable motivated and talented high school graduates to attend college. These directives aimed at the academic development of students to ensure the national safety and competitive place of the United States among the world's scientific achievements, exploration of space, military powers, and economic leaders.

Title V of the NDEA specifically addressed the need for more school counselors and, indirectly, the role of counselors in assisting students by assessing their educational potential and guiding them in their academic development. Essentially, this part of the bill noted that schools needed more counselors who were prepared to encourage students to complete high school, select academic courses that would ready them for college, and enter college upon graduation from high school.

Support from NDEA to improve guidance and counseling services in secondary schools came in the form of federal funds to the states for the purpose of establishing and maintaining assessment, counseling, and other guidance related services. NDEA also authorized the creation of institutes and graduate programs at colleges and universities to increase the number of counselors and strengthen the training for current and future counselors working in schools. During the summer of 1959, guidance and counseling institutes at 50 colleges and universities prepared over 2,200 counselors to meet the expectations put forth by NDEA. In addition, NDEA provided $15 million a year to assist local school systems and about $7 million a year to universities and colleges for the purpose of establishing and improving school counseling services, with particular emphasis on students' academic development (Miller, 1968; Shertzer & Stone, 1966).

The result of the NDEA, Title V, on the school counseling profession was remarkable. In his summary, Miller (1968) noted that, in a 5-year period, the number of school counselors increased from 12,000 to over 27,000 across the country, dropping the ratio of counselors to students from 1:960 to 1:530 during that period. In the process, the number of state consultants for school guidance and counseling increased two and one half times to over 250 consultants, and the federal government funded more than 400 institutes to prepare more than 13,000 counselors. Expenditures for the delivery of guidance and counseling services in local schools rose tremendously from 1958 until the mid-1960s, beginning in the $5.5 million range to over $127 million.

The federal government expanded NDEA in 1964 to include elementary school counseling as well as counseling in junior colleges and technical schools (Gibson, Mitchell, & Basile, 1993). As a result, NDEA training institutes added content about counseling young students in elementary schools. Despite this added emphasis, school systems were reluctant to employ elementary counselors. This hesitancy

may have been due to schools' uncertainty about the role of counselor's in elementary education and the public's lack of general acceptance to the idea (Schmidt, 2008).

In 1965, the federal government once again intervened in public education due to continuing concerns about students' academic development. Despite the focus of NDEA, many students, particularly those from impoverished and lower income families, were not progressing educationally. Congress passed the *Elementary and Secondary Education Act* of 1965 (ESEA; Public Law 89-10) to provide states with funds and support for special instructional programs and counseling services to improve the educational opportunities of students from lower income families. This bill had an impact on the development of counseling services in elementary schools. Before 1965, only progressive school districts with strong financial bases were able to support school counseling services below the secondary level. ESEA allowed flexibility for states and local districts to identify federal funds for this purpose.

The overall effects of NDEA and ESEA on the focus of school counseling and guidance services through the 1960s and into the 1970s placed greater emphasis on helping students with their academic development. Nevertheless, development of new counseling theories and models of school counseling programs emerged at this time lending a more holistic perspective to the mission of the profession. In some measure, we can attribute this broader focus to the belief that school counselors and the programs they design to serve students should not compartmentalize human developmental needs and aspirations. By holding to a single perspective on academic growth and success, school programs risk neglecting important personal, social, and career issues that might influence students' intellectual and educational development. Contrarily, by emphasizing personal/social development while ignoring educational development, school counselors neglect a vital purpose for working in schools—students' academic success. Therefore, what we note in the emerging school counseling profession of this period is a range of newly proposed theories of counseling and models of service delivery that attempted to address interconnected and inter-related developmental aspects of students. From the 1960s and into the 21st century, these theoretical approaches and programmatic models helped give direction to the school counseling profession by attending to academic, career, and personal/social aspects of student development.

Academic, Career, and Personal/Social Development

The work of Carl Rogers in the 1950s fueled the development of new theories of counseling and approaches to professional helping. Many of the more popular approaches appeared in the 1960s and 1970s. These emerging theories included behavioral approaches, cognitive theories, ego-psychology, self-concept theory, and others. Models and approaches to group work also appeared during this period. Over the years, popular approaches to counseling that seemed compatible with the school setting and student development included Adlerian Counseling, Reality Therapy, Rational-Emotive-Behavioral Therapy, Person-Centered Counseling, and Multimodal Therapy, among others.

Various counseling approaches developed during the 1960s and 1970s encouraged counselors to consider broader student development issues. With this change in direction, the school counseling profession brought together three main developmental aspects that separately had defined the role of counselors in schools up to this point in time. Now the profession advocated for programs of services to address the academic, career, and personal/social development of students. In addition, this new direction encouraged the expansion of services to include all students in the schools, perhaps influenced by the Civil Rights movement of the time and subsequent integration of the public schools.

This broader mission for school counseling was complemented by greater emphasis on programmatic planning and delivery of services. The thrust behind this broader emphasis was the notion that counselors needed to work more closely with teachers in identifying school issues affecting student development, and by planning programs of services to address these obstacles to learning.

Since the 1970s, the school counseling profession has placed greater emphasis on well-designed programs of services to meet the developmental needs of a larger student population. Norman Gysbers (1978; Gysbers & Henderson, 2000; Gysbers & Moore, 1981), a counselor educator from the University of Missouri–Columbia, deserves much credit for initiating this professional direction by developing a comprehensive program model and researching its effectiveness. With his colleague, Patricia Henderson, a director of guidance in San Antonio, Texas, Gysbers provided a structure for school counseling program development, and equally important, set the stage for significant reform in the profession. Robert Myrick (1997) is another counselor educator who influenced the programmatic philosophy of school counseling through his developmental approach to program planning and service delivery.

Counselor educators and researchers, such as Gysbers and Myrick, helped guide legislative and educational action in many states during the 1970s and 1980s. States such as California, Missouri, North Carolina, Oklahoma, and Texas created guidelines for establishing comprehensive school counseling programs. For example, in the 1970s the North Carolina legislature endorsed the *North Carolina Master Plan for Guidance,* a plan that continued through the mid-1980s. North Carolina has revised its suggested plan using

the *ASCA National Model* (American School Counselor Association [ASCA], 2003) as its template.

D. Brown and Trusty (2005) noted that several models for comprehensive school counseling programs exist in the literature. Although philosophical differences exist among these models, most suggest structures and strategies to design comprehensive programs of services, such as assessing and determining students' needs, setting goals and objectives, aligning services within the curriculum, coordinating and delivering appropriate services, and evaluating results. At the same time, many authorities view comprehensive school counseling programs of services as essential to the school curriculum (Schmidt, 2008). This belief maintains that school counseling services are no longer ancillary or simply supportive of the school mission. Rather, the indirect and direct services of a comprehensive counseling program are *essential* to helping each school reach its goals. To make this belief a reality, school counselors actively collaborate with classroom teachers, school administrators, and other school and community personnel integrating guidance activities and counseling services into the daily function of the school.

This section has explored the historical development of the school counseling profession by using aspects of student development as its framework. In addition, it has offered a brief summary about the introduction and development of comprehensive program models to further define the school counseling profession. We will return to comprehensive models later in this chapter when we review the *ASCA National Model* (ASCA, 2003) and other models, but before doing that, the next section gives a brief summary of the expansion of school counseling into elementary education.

Counseling in Elementary Schools

Elementary guidance and counseling had its birth as early as 1910 in the Boston schools where teachers were appointed counselors (Gysbers & Henderson, 2000). For several years, however, the elementary movement remained undeveloped until William Burnham began focusing on counseling in elementary schools during the 1920s and 1930s (Faust, 1968; Studer, 2005). Burnham emphasized the total well being of young students and the essential role classroom teachers played in working with the school counselor to focus on the mental health of children. Because few school systems employed counselors for elementary counseling programs (Gibson et al., 1993), a scarcity of information and knowledge about establishing programs for elementary schools existed. Consequently, in its infancy, elementary counseling adapted perspectives and approaches from secondary guidance programs of services (Schmidt, 2008).

During the early 1960s, schools witnessed an increase in the number of counselors employed for elementary school programs (Faust, 1968). National surveys and other studies of this period found that these early elementary counselors performed functions remarkably similar to the services provided in today's contemporary programs, including

- providing individual counseling with students;
- conferring with teachers and parents about children's needs, developmental characteristics, and school progress; and
- referring students and their families to community agencies (Foster, 1967; Greene, 1967; McKellar, 1964; Schmidt, 2008).

Greene's (1967) survey of more than 1,100 counselors nationwide examined over 100 possible functions and found that the services and activities performed at the upper elementary grade levels contrasted with those in the primary grades. "Counselors at the intermediate grades seemed to have more direct contact with children, whereas primary counselors spent more time consulting with parents and teachers. The most common services in both intermediate and primary grades were referral services" (Schmidt, 2008, p. 17). At about the same time, Foster (1967) used a survey consisting of 84 functions and reported that counselors, counselor educators, teachers, and administrators perceived counseling as the most important function of the elementary school counselor.

Faust (1968) chronicled the development of elementary counseling across three periods. The *traditional* phase from the early 1900s through World War II observed the adoption of secondary school beliefs and methods, as I noted earlier. The second phase, which he called the *neotraditional* period, saw less of a secondary school influence and more attention to using group process and emphasizing student learning. Faust termed the third phase, beginning in the 1960s, as the *developmental* period, which elevated student development over crisis intervention as a major program goal.

A 1966 report by the Joint Committee on the Elementary School Counselor (Association for Counselor Education and Supervision [ACES]–ASCA) helped to support this notion of focusing on student development while lending clarity to the role of the emerging role of elementary school counselors. This report delineated the major functions of elementary school counselors as counseling, consulting, and coordinating. At the same time, the report surmised, "Effective learning climates were to be central to the work of school counselors" (Gysbers & Henderson, 2000, p. 17).

As additional surveys and reports appeared in the professional literature, elementary school counseling gained

visibility and acceptance across the country. From the late 1960s and through the 1970s, additional counselors were employed in elementary schools. This growth was accompanied by the publication of the *Elementary School Guidance and Counseling* journal of the ASCA beginning in 1968.

The growth in elementary school counseling was also an outcome of national legislation and government reports that helped give definition to and broaden the scope of the school counseling profession from the 1960s until today. For example, the 1975 *Education Act for All Handicapped Children,* commonly referred to as Public Law 94-142, influenced the consulting role of counselors in working with parents and teachers (Schmidt, 2008). Changes to that initial law continue to have an impact on how school counselors function with regard to exceptional students, even though counselors were not specifically mentioned in the original bill.

According to Gysbers and Henderson (2000), the *Elementary School Guidance and Counseling Incentive Act* of 1979, introduced in the U.S. House of Representatives, proposed funds to establish comprehensive counseling programs in elementary schools. Although not passed by Congress, the bill is significant because of its emphasis on elementary counseling and the importance of comprehensive programs. Congress passed and President Clinton signed the *Elementary School Counseling Demonstration Act* 20 years later, providing $20 million for schools to employ elementary school counselors (Sciarra, 2004).

Publication of the *A Nation at Risk* in 1983 by the National Commission of Excellence in Education focused attention on the declining achievement of U.S. students. The report alarmed the country, and combined with subsequent books and reports about the state of American education, launched the beginning of the educational reform movement we currently experience in schools today (D. Brown & Trusty, 2005). Not all authorities, however, accepted the findings of *A Nation at Risk*. Berliner and Biddle (1995) were two researchers who claimed the report contained more myth than fact about American students' academic performances (D. Brown & Trusty). Nevertheless, *A Nation at Risk* propelled the United States into an accountability mode known as the *effective schools* movement, which has guided how schools function, teacher preparation programs, and other aspects of American education including the school counseling profession (Schmidt, 2008).

The events and legislation mentioned here are but a few examples of the initiatives that have influenced the growth and direction of school counseling. All of them helped to focus on the need for counseling services in schools, the importance of organizing such services into comprehensive programs, and the demand for accountability in determining the outcomes and effectiveness of such programs. In the next section of this chapter, we revisit the emphasis on comprehensive models of school counseling programs.

Comprehensive School Counseling Programs

During the 1970s, several authorities emphasized the need for school counselors to plan comprehensive programs of services and some suggested specific models for program design and development (Gysbers & Henderson, 2000). Many of these models focused on program goals, objectives, and activities for career development and vocational guidance (e.g., Herr & Cramer, 1979; Hilton, 1979), while others advocated for programs with broader intent (e.g., Ballast & Shoemaker, 1978; J. A. Brown, 1977; Mitchell & Gysbers, 1978). Despite many attempts to describe a comprehensive role for these counselors in schools, school systems and state education departments faced the challenge of creating consistent descriptions and guidelines for the school counselor's role within a comprehensive program of services.

As noted earlier, Gysbers and Henderson (2000) pointed to the clinical-services model that emerged during the 1960s as focusing too heavily on the position, role, and function of the counselor, rather than on program development to meet developmental needs of students. D. Brown and Trusty (2005) discussed this history as well, but they referred to the clinical-services approach as the "essential services model" (p. 80), and credited Schmidt (2003) for promoting this model in recent years. Contrary to D. Brown and Trusty's interpretation, Schmidt did not use the exact term, "essential services model." Rather, he listed various essential services of a comprehensive program as being more than simply support or ancillary services. "A key element in describing a comprehensive counseling program is the notion that these services are *essential* to the school" (Schmidt, p. 62). The decision about which services are essential for a particular school, according to Schmidt, rests with the stakeholders in that school—counselors, teachers, administrators, parents, and students.

Schmidt (2003) did not present a specific model for a comprehensive school counseling program, but encouraged counselors and schools to adopt a philosophy of program planning, organization, implementation, and evaluation. Within such a framework, "[S]ome common processes and services are used by school counselors [and] these processes and services help define and describe the nature and scope of a comprehensive school counseling program" (p. 67).

D. Brown and Trusty (2005) distinguished types of comprehensive programs as either *prescriptive* or *nonprescriptive*. They suggested that the essential services model is nonprescriptive because it does not prescribe specific

components or mission of a comprehensive program. Consequently, the "nature of the essential services model may increase the likelihood that school counselors will be assigned nonprofessional responsibilities" (p. 82). In contrast, they presented Gysbers and Henderson's (2000) Comprehensive Guidance Program Model (CGPM) and *The ASCA National Model: A Framework for Comprehensive School Counseling Programs* (ASCA, 2003) as two examples of prescriptive models that advocate "against the inclusion of nonprofessional activities as part of the school counseling program" (D. Brown & Trusty p. 83). D. Brown and Trusty compared and contrasted these two models, and although they concluded that both models "represent significant advances in conceptualizing the organizational structure of school counseling programs," both were lacking some aspects "deemed essential to strategic models" (p. 89). They recommended a Strategic Comprehensive Model (SCM), which seems to include some concepts, processes, and terminology proposed by Schmidt (2003), while at the same time adopting elements of the CGPM and ASCA National Model. Interestingly, D. Brown and Trusty claimed, "There are no prescribed roles or activities for school counselors in the SCM" (p. 90), which further contrasts their model with the prescriptive philosophies of the CGPM and ASCA National Model.

Some authorities in school counseling have promoted a general philosophy of program planning, development, and evaluation without identifying or naming specific models (Baker & Gerler, 2004; Schmidt, 2008). As one example, Baker and Gerler encouraged a balanced approach to school counseling programs. They defined *balance* as program goals that place equal importance on *prevention* and *intervention* strategies. To achieve such balance, they suggested two program goals: (a) managing intervention demands and (b) programming for prevention. In theory and practice, a comprehensive program is designed and developed around these two broad goals.

Based on the development and promotion of comprehensive school counseling programs as a means of better serving students, parents, and teachers in schools, it appears that the profession is making strides to identify itself. Through the long journey that began in the late 19th century and now in the 21st century, the quest of establishing a clear mission for counseling in schools as well as a consistent professional identity for school counselors continues.

The School Counselor's Professional Identity

In this first chapter, you learned that the earliest signs of an emerging school counseling profession began as a reaction to vocational, cultural, and social events during the U.S. Industrial Revolution. With that beginning, the profession continued to grow by responding to national and world events over the next hundred years and more. Although this reactive posture helped to describe the role of school counselors, this description has not been consistently recognized in developing a clear identity for the profession. Many authors have stressed the importance of school counselors' creating a professional identity to ascribe consistent purpose for their roles in schools (e.g., Baker & Gerler, 2004; Gladding, 2000; Myrick, 1997; Schmidt, 2008), but despite such encouragement, uncertainty about the school counselor's role continues in most states across the country.

Some authors have pointed to the use of inconsistent and confusing terms to describe the profession and its services as *guidance counselors*, *guidance services*, and *guidance programs*, in contrast to *school counselors*, and *school counseling programs* (e.g., Baker & Gerler, 2004; D. Brown & Trusty, 2005; Schmidt, 2004, 2008). This is not a new discourse for the profession. For over 50 years, the term *guidance* has been cited as vague and confusing for both the people who work and learn in the schools, including counselors, and the audiences served by the profession—students, parents, and teachers, and the public at large (Shertzer & Stone, 1966). Today, debate and confusion continue in part because traditions are sometimes difficult to change and one of the most popular authors and researchers in the field uses the terms *guidance program* and *guidance activities* (Gysbers & Henderson, 2000, p. 78). In contrast, the *ASCA National Model* (ASCA, 2003) uses the term *comprehensive school counseling program*, and D. Brown and Trusty commented that, although the differences remain an issue for the profession, "the scales seem to be tipping toward the ASCA terminology" (p. 6). Perhaps what is most important to the profession is that although some language remains problematic, common concepts and goals for developing comprehensive programs, expressed by many authors, might move school counseling in a clear direction (ASCA, 2003; Baker & Gerler, 2004; D. Brown & Trusty; Gysbers & Henderson; Schmidt; Studer, 2005).

In addition to the professional textbooks and other literature published about school counseling programs and practices, the future direction taken by the ASCA will have an impact. The ASCA has one of the largest memberships of the divisions of the ACA (Schmidt, 2008). The *ASCA National Model* (ASCA, 2003), in addition to other comprehensive models of program planning and service delivery, will help distinguish counselors who practice in educational settings from counselors who work in clinical environments. That distinction will not be based on a counselor's level of preparation or knowledge of clinical skills, but rather on the focus given to comprehensive

programs of services to meet the developmental needs of an expanded audience.

The *ASCA National Model* (ASCA, 2003) and other examples of comprehensive program planning and service delivery provide the school counseling profession with an organizational framework and philosophical position with which to create, deliver, and evaluate services that help students with academic, personal/social, and career development. As such, these efforts have proposed national standards to help students be successful across a full range of developmental tasks. In chapter 2 of this *Handbook,* you will explore these standards more fully. The next historic step for the profession in the process of developing an identity for school counseling will be to create national standards of professional preparation and practices for counselor education programs and school counselors to follow (Schmidt & Ciechalski, 2001).

This *Handbook* introduces you to a number of professional issues about counseling standards, supervision, and competence when working with diverse populations. This *Handbook* also offers suggestions for specific interventions with particular students and school populations. In addition, you will learn about measures of program accountability, legal guidelines, and ethical standards to increase your knowledge in becoming an effective school counselor. This chapter has provided the historical foundation upon which you can learn this knowledge and skill and subsequently build a successful career as a professional school counselor.

II

A CONCEPT OF BEST PRACTICES IN TRAINING SCHOOL COUNSELORS

ROBBIE J. STEWARD, DOUGLAS M. NEIL, AND MATTHEW A. DIEMER
Michigan State University

The primary objective of this chapter is o provide a critical analysis of the literature addressing the best practices in training school counselors in attending to the most critical issues in K–12 school settings. The first section presents extensive training content and guidelines that extend beyond the minimal standards purported by the Council of Accredited Counseling and Related Educational Programs (CACREP), the American Counseling Association (ACA), and the Missouri Comprehensive Guidance Model (MCGM), which has been revised and adapted to fit the needs of individual states. The second section provides an overview of the literature describing the process uniquely associated with graduate education and the relevance to enhancing current professional guidelines in the training of school counselors. The third section describes a master's level, school counselor training model used at Michigan State University, which also includes additive training practices and that more comprehensively attend to the needs of both community counselor trainees and schools. The suggestions for consideration are based on the most recent literature and research findings, as well as on the authors' extensive professional experiences within the school setting as consultants, building coordinator in a professional development school, school counseling supervisors, service providers, and researchers. This latter information regarding the experiences of the authors is important given the trend found that most citations in the literature consist of university faculty who have had very limited, if any, direct professional experience within the K–12 school setting (N. S. Carlson, 2001).

Training and the Council for the Accreditation of Counseling and Related Educational Programs

Since 1981, the CACREP (2001), a national accrediting agency, has assumed the very important charge of establishing minimum standard training curriculum and practices for school counselors. Its incorporation as an independent body resulted from a culmination of years of work by the ACA toward defining the sets of knowledge and skills required for admission into the profession and to advocate that these requirements be adopted by the preparation programs offering counseling and student development practice degrees (Bobby & Kandor, 1995). Periodically contacting counselor educators and practitioners within the school setting to receive feedback and recommendations for guideline revisions (Schmidt, 1999), the CACREP consistently provides the essential training guidelines that are most meaningful to the current needs of K–12 students. (The information collection process through e-mail survey with this objective has already begun toward the development of the 2008 minimum standards.) Evidence of a commitment to maintain the critical link between training and service delivery is evident in the clearly established relationship between the eight core knowledge areas for all counselors (i.e., Professional Identity, Social and Cultural Diversity, Human Growth and Development, Career Development, Helping Relationships, Group Work, Assessment, and Research and Program Evaluation) and the K–12 school counseling program models that have been adopted by a number of schools across the nation to provide a balance between intervention responses and proactive prevention program-

ming (Holcomb-McCoy, 2005): the national model for school counseling programs (American School Counselor Association [ASCA], 2003; Akos, Goodnough, & Milsom, 2004; Dahir, 2001; Perusse, Goodnough, & Noel, 2001), Missouri Comprehensive Guidance program model (Gysbers & Henderson, 2001), Myrick's (1993) Invitational Theory of Practice model (Stanley, Juhnke, & Purkey, 2004), and the Transformative Individual School Counseling model (Eschenauer, 2005). Although varying in degrees to which percentages of counselors' time is allocated toward each CACREP domain activity, each of these leading models is developmental in nature, has a guidance/career component, highlights attention to individual differences within student populations (i.e., race/ethnicity, culture, socioeconomic status), and acknowledges the importance of individual and group counseling competence, consultation, and program development and evaluation. Empirical research that has examined the effect of this linkage has found statistically significant results in pre- and post-implementation of CACREP guidelines in the relationship between training program status and on-site supervisors' perceptions of training (LaFountain & Baer, 2001). Accreditation status has also been significantly linked with higher entrance standards and academic potential of master of arts counseling students (Pate, 1990), graduates' increased multicultural counseling competence (Dinsmore & England, 1996), heightened attention to ethical issues in training, a willingness to follow through in addressing legal/ethical violations among trainees (Gaubatz & Vera, 2002), and faculty and students' perceptions of program improvement (Schmidt, 1999). Given the longevity of this major contribution to the profession of counseling, the level of respect among professionals within higher education and within K–12, and the long-standing vigilance of this agency to comprehensively evaluate graduate level programs' effectiveness in preparing individuals to most effectively assume the role of counselors, counselor educators' strict adherence to these currently existing minimum practice guidelines as the core foundation to any training environment is certainly warranted.

However, it remains imperative that counselor educators and school counselors remain committed to review the literature and to constantly assess and reflect on the strengths and limitations of training in preparation for standard practice and service delivery to student populations and school setting staff both locally and nationally. In a review of the literature, a number of studies have highlighted a wide range of responses from the professional arena to the existing CACREP guidelines related to school counselors, some including recommendations for additions and stronger statements about specific topic areas. In spite of the prevailing status of CACREP as the premier accrediting agency for master's level programs within this country, the benefits of the core curriculum standards have been found to be received with varying levels of acceptance within and between professional groups surveyed (i.e., American Mental Health Counselors Association, American School Counselor Association [ASCA], and Association for Counselor Education and Supervision) (McGlothlin & Thomas, 2004).

On one hand, those who most strongly support and embrace the existing guidelines have created opportunities to educate school districts concerning the importance of CACREP in training and service delivery within the school setting (LaFountain & Baer, 2001). Other strong CACREP proponents have developed a listing of Internet Web sites that align with the CACREP eight common core knowledge areas to assist training programs in more comprehensively and intentionally attending to each of the core guidelines (Keller & Goodman, 2003). The wide-range acceptance of the CACREP as an accrediting agency is also reflected in the fact that, as of May 2005, 159 master's level school-counseling programs have applied for and received accreditation by this agency. An average of 12 to 13 new applications are anticipated annually. The perception of legitimacy of CACREP as an accrediting agency within school counseling is well validated.

However, some within the profession raise questions about the limitations that are inherent within the CACREP guidelines. In other words, among these individuals, the guidelines for the most part are deemed acceptable but perceived as limited in scope. Some believe that these limitations impede optimal training outcomes in preparation for service delivery to the schools. To provide a brief overview, the authors have categorized the areas of concern purported in the literature into the following themes: (a) enhancement of currently required curriculum, (b) critical school setting issues, and (c) counselor-trainees' psycho-socioemotional development.

Enhancement of Currently Required Curriculum

In an online search of articles in ERIC and ACA journals, the most cited theme that emerged was the recommendation of the enhancement of currently required curriculum to specifically address deficits identified within the school setting. The following sections represent the content areas that had been highlighted within the literature in which authors suggested a need for greater attention and reflection given the changing K–12 student population.

Issues of diversity. The most predominant area of focus that surfaced highlighted the need for increased attention to some point of racial/ethnic diversity or individual difference such as gender (R. M. Hoffman & Myers, 1996), multicultural counseling competency development (Hays, 2002; Holcomb-McCoy, 1999; Margolis & Rungta, 1986), urban

school counseling competence (Butler, 2003; Green, 2005; Lee, 2005; Schultheiss, Palma, & Manzi, 2005), spirituality and religion (Matthews, 1998; Young, Cashwell, Wiggins-Frame, & Belaire, 2002), and sexual orientation (R. M. Hoffman, 2004). Although each of these areas of experience and competence are considered critical for attention and inclusion in minimal standard training curriculum, authors also are well aware of the impossibility of faculty members' extensive attention to all areas given the CACREP required 48-credit-hour structure of most master's level counseling programs. This is particularly noteworthy for instructors of multicultural counseling courses who are sometimes expected to attend extensively, within a 16-week semester, to every possible point of diversity that is associated with culture and special populations that may exist within the school setting.

Assessment and diagnosis. These authors (Elmore, 2001; Hansen, 2003; R. M. Hoffman, 2001; Impara, 1995; Reeves, Wheeler, & Bowl, 2004; Schafer, 1995) have purported the necessity for counselor educators to more specifically attend to trainees' familiarity with the use and interpretation of measures toward diagnosis using the DSM-IV-R. Given the increasing prevalence of students' psychosocioemotional problems within the K–12 school setting, proponents purport that counseling programs must now better familiarize trainees with standard assessment measures used with the K–12 population, and develop competence in how to use the literature to interpret the results and develop recommendations for intervention (Giordano, Schwiebert, & Brotherton, 1997). These competences have typically been associated with nonschool counselors, but given the changing student population, these authors suggest the necessity for counselor educators' increased and concerted efforts toward remediation of this knowledge and skill limitation.

Legal/ethical practice in service delivery. This is another area that is based on a shifting of prevalence within the school setting (Jordan & Stevens, 2001; Lambie, 2005; Lawrence & Kurpius, 2000). With increased violence within school settings and within families and with the increased representation of those being harmed by others and students who may do harm to self and/or others, professionals within the school must understand the importance of assuming the responsibility of assessing when to report, identifying to whom a report is required, and actually reporting to authorities. Issues such as students' experiences with bullying (Embry & Luzzo, 1996; Lambie; Urofsky & Sowa, 2004) and nonconsensual sexual activity among students (K. A. King, Tribble, & Price, 1999) are only a few of those that counselors must address. Due to limitations of confidentiality, the definition of due process, and duty to warn, school counselors, like their nonschool counselor peers, should now adhere to specifying guidelines regarding parents' and students' informed consent rights. Given that informed consent forms are not standard practice within school settings, there is typically no systematic reminder of the importance of attending to legal and ethical issues in school counseling activity, which includes privileged communication with minors (i.e., Ahia & Martin, 1993). Consequently, it becomes even more critical for counselor educators to train school counselors, who are not only knowledgeable of the professional legal/ethical code (ASCA, 2004) but also aware of their responsibilities to assess when to report and to inform students and parents of the parameters of their counseling relationship and of what will happen if a specific kind of information is shared.

The authors have identified two patterns that may emerge within school settings that are in direct violation of school counselors' legal and ethic responsibilities to report. For example, in suburban, higher income communities, school counselors may tend not to report that which they should in order to protect family image and the reputation of the school. Whereas, in urban, lower income communities, school counselors may tend not to report that which they should because of the prevalence of perceived violations and past negative experiences with reporting. In both cases, increased harm for the students and potential professional harm to counselors and trainees due to possible litigation can be outcomes. Regardless of the community setting, school counselor-trainees must leave training understanding the anxiety that might surface as they assume this professional responsibility and with the willingness to do so in spite of nonsupport which can occur from those more senior within the profession, from teachers, from parents, and from administrators within practicum, internship, and eventually permanent work settings if the identification of common practices within the setting are not clear before placement.

The other side of the legal/ethical issue that seldom and hesitantly is addressed in master's programs is the responsibility for counselor educators to serve as gatekeepers to the profession by monitoring students' progress in terms of counseling competence (Gaubatz & Vera, 2002; Vacha-Haase, Davenport, & Kerewsky, 2004). Given that most school districts require all applicants to complete a felony report form and give permission for a background check by authorities, we propose that it would be equally as important for counselor educators to include within their program handbooks and application materials some statement of the necessity for all interested in the pursuit of certification as school counselors to consider this requirement prior to application. Of course, the same is true for all students who eventually wish to apply for the status of licensed professional counselors, in which the same kind

of information is requested. Although CACREP does not address this issue directly, we believe that it is imperative to inform all applicants and remind current students of the influence of engagement in and potential convictions for illegal activity can have on practicum/internship placement and professional futures. Counselor educators need to be gatekeepers not only in terms of counselor competence but also in terms of character. This recommendation was even more salient due to the results of one state audit, which found that the Michigan Department of Education had failed to adequately track teachers convicted of sexual assault and other crimes. Several teachers convicted of crimes against minors never had their certifications revoked, and the Department to Education reported that it had never heard of the convictions from local prosecutors. This case of a communication glitch in a government system verifies the necessity for training programs to develop some guidelines for selecting students for admissions and for including this kind of information in the process of supporting endorsement of current students in the program. Although this presents somewhat of a sensitive legal issue in terms of faculty decision making, we strongly support that the minimum training policy should include at least a statement to inform applicants and current students of the short- and long-term implications for the engagement in criminal activity. In these cases, program faculties need to have access to professional legal assistance (Lawrence & Kurpius, 2000).

The third and final aspect of the legal ethical responsibility, which is frequently cited in the literature but not addressed specifically within the accreditation standards, is the role of school counselors as advocates for the academic success of every student (ASCA, 2003). According to the *National Model* (ASCA), school counselors' advocacy efforts involve leadership, collaboration, and systemic change. These efforts, which evolve out of an advocacy disposition, knowledge of resources, and effective communication skills with both children and adults, should have the following objectives: eliminating barriers to students' development, creating opportunities to learn for all students, ensuring access to a quality school curriculum, collaborating with others within and outside of the school to help students meet their needs, and promoting positive, systemic change in schools (Trusty, 2005). This means that school counselors are not only practitioners competent to work with K–12 student populations, but also social change agents who can effectively communicate and negotiate with adults in order to work toward equity and social justice within the school setting (Bemak, 2005; Dahir, 2004).

In light of the prior sections, both being multiculturally competent (Sue, Arrendondo, & McDavis, 1992) and addressing discrimination (Ponterotto, 1991; Trusty, 2002) are indicators of advocacy. However, in anticipation of the next section's addressing the role of school counselors as researcher–practitioner, Eriksen's (1997) definition of advocacy includes generating research on the efficacy of counseling. Myers, Sweeney, and White (2002) noted that any form of promoting counselors' credibility in the public's eye is a salient advocacy task and a noteworthy point that should be addressed in training.

Counselors as researcher–practitioners and scholars. In the face of the increasing necessity of establishing professional accountability of all professionals within the schools (Whiston, 2002), particularly given the most recent U.S. Department of Education (2001) legislation, No Child Left Behind, which mandates all federally funded programs be accountable for and directly connected to student learning and improvement (Hatch & Bowers, 2002), it becomes imperative for counselor educators to prepare students who not only are practitioners, but also have knowledge of how to use the literature to support the rationale for a study; understand the importance of human subjects approval and informed consent for participation in research; are able to collect, analyze, and interpret data; and can sustain a commitment to influence the profession and assist others with the community by committing to scholarship and professional presentations (ASCA, 2003; N. S. Carlson, 2001; Gordon, McClure, & Petrowski, 1994; Larson & Besett-Alesch, 2000). Trainees must have the experience with systematically implementing a research program for understanding students' development within the setting and evaluating the efficacy of the school counseling program's contribution to students' development and achievement (ASCA, 2003).

The authors identified five specific themes associated with recommendations for school counselors' research activities that might frame practitioner–researcher activities: (a) studies that identify school counselors' attitudes and practices (e.g., Astramovich, 2002; Scarborough, 2005), (b) studies that compare individual and group counseling processes with certain populations and client issues (e.g., Granello & Granello, 1998; Lin, Kelly, & Nelson, 1996), (c) studies that evaluate the impact of school-counselor-led interventions on student academic achievement and school success behavior (e.g., Brigman, 2003; Bruce, 1997), (d) studies that examine the relationship between school counselors' training and person variables on self-efficacy and students' evaluation of service delivery (e.g., Peterson, Goodman, Keller, & McCauley, 2004; Ray, Armstrong, Warren, & Balkin, 2005; S. L. Smith, Crutchfield, & Culbreth, 2001), and (e) studies that examine the relationship between students' personal variables and academic achievement and school success behavior (e.g., Trusty & Niles, 2004). Attention to each of these domains would increase accountability and be additive to both the local and broader professional

community. Nevertheless, research and scholarship have traditionally been associated only with the doctoral educational process (LaPidus, 1998). Consequently, including this component within the training of master's level school counselors would be a major deviation from standard practice in training.

Nevertheless, this recommendation will be most challenging to attend to in training and in practice for two main reasons that extent beyond curriculum. Due to larger student cohort sizes and advisee loads and to a service delivery focus that extends beyond content presentation and integration, master's level faculty members' research activities and scholarship productivities have been consistently found to be more limited in number than doctoral level faculty. Consequently, the traditional thesis/dissertation model of working individually with novice researchers in the development of publishable manuscripts based on research activity will pose an additional challenge in the faculty members' professional development toward promotion and tenure at major research institutions. A parallel problem is that school counselor to student ratios strain their time for providing direct service to students. The ASCA (1999) suggested that the ideal ratio is 1 counselor per 250 students; however, Marino, Sams, and Guerra (1999) reported that the nationwide ratio is 1 counselor per 513 students. With these kinds of faculty load assignments and school counselors' service delivery loads, little or no time would be available to commit to research activities without support from administration and a systematic research activity imbedded within the structure of the school counseling program. Though seemingly important to both parties, the time for engagement in the standard practices within training programs and school settings is limited if not nonexistent.

School counselors as supervisors and career development. The significance of supervision in counseling is quite apparent in state licensing laws and professional accreditation standards that require students to have supervision during practicum, internship, and post-master's degree in order to secure licensure (Akos, Konold, & Niles, 2004; Crespi, 2003; Fischetti & Lines, 2003; Kahn, 1999; Remley, & Huey, 2002; Schultheiss et al., 2005; Studer, 2005). Consequently, it has become imperative that current practitioners, whose training did not include supervisory skills development, now pursue opportunities for training given the ACA Code of Ethics. In response, a number of doctoral level professionals in Counseling and Counseling Psychology are developing and providing 1 to 2 day ACA-criteria-based workshop opportunities to train currently practicing school counselors, school counselors are contacting universities for graduate level counseling supervision course work that has typically been reserved for doctoral students, and a few training programs are now considering how to infuse such training prior to degree completion. At this point, no evidence in the literature identifies a strategy for doing so that extends beyond the traditional addition of course work, which will certainly tax faculty in terms of time commitment during a period of sensitivity about budget cuts in higher education, and will also present additional financial overloads for students who seek master's level training without guaranteed funding and with limited income. Once again, the necessity for attending to this training issue is not to be argued, given the importance of providing only a service in which one has been trained, but strategies for infusing this experience within training have not been identified at this time.

Counselor-Trainees' Psycho-Socioemotional Development

The third theme addressed within the context of this chapter moves beyond recommendations associated with curriculum and instruction toward a more focused strategic framing, development, and integration of training experiences that provide in-depth attention to counselor-trainees' personal development as counseling competence and professional development evolves (Barbee, Scherer, & Combs, 2003; Downs, 2000; Tang et al., 2004). The almost nonexistent attention of the CACREP core components to the counselor-trainees' healthy psycho-socioemotional development is perceived by some as overlooking the well-established, tightly integrated, empirical link between counselors' personal variables and counseling competence (Haverkamp, 1994; Stein & Lambert, 1995; Stevens, Dinoff, & Donnenworth, 1998).

There is much support for those who recommend strong language and attention to trainees' personal development. Borders, Fong, and Neimeyer (1986) found that students at higher levels of ego development had a greater awareness of clients' needs than did those students at lower levels of ego development, while Carlozzi, Gaa, and Liberman (1983) found that students at lower levels of ego development were less empathic than those at higher levels were. Borders et al. (1986) found that most of the counseling graduate students were functioning at or above the conscientious level of ego development wherein individuals possess self-evaluated goals, differentiated self-criticism, and senses of responsibility on which genuine feelings and abilities to attend to the needs of others are based. Watt, Robinson, and Lupton-Smith (2002) found that the very process of training has a statistically significant effect on trainees' ego development, earlier studies have found the same to be true for students' cognitive development (Etringer, Hillerbrand, & Claiborn, 1995; Leach, Stoltenberg, McNeil, & Eichenfield,

1997) and interpersonal and intrapersonal skills even outside of the counselor–client relationship (Furr & Carroll, 2003).

Developing training experiences that strategically attend to personal development would seem even more imperative given the expectation that many trainees arrive with psychological wounds, eventually to become "wounded healers," and the implications for this population within the training cohort (Mander, 2004). Though these personal histories that remain in need of resolution can be instrumental in establishing effective working alliances with clients, such histories not addressed during training can have negative outcomes during practicum. One example of this phenomenon is the result of a study in which trainees' lower avoidance and higher anxiety, indicators of attachment, were found to be associated with highest levels of empathy, and higher avoidance and lower anxiety were associated with the lowest levels of empathy (Trusty, Ng, & Watts, 2005). In a review of literature addressing countertransference (CT), counselors' conscious and unconscious reactions toward clients based on counselor's unresolved conflicts (Gelso & Carter, 1985), Rosenberger and Hayes (2002) reflected that CT, strongly associated with state anxiety, can assume several forms of exhibition within the counseling relationship: cognitive responses (e.g., distorted perceptions of clients, in accurate recall of client material, reactive, defensive mental activity, blocked understanding, uncertainty, changes in treatment planning); affective responses (e.g., anger, sadness, boredom, nurturing feelings); and behavioral responses (e.g., avoidance or withdrawal). It would seem safe to conclude that trainees' awareness and resolution of personal issues are required in order for trainees to draw from their own experience in working with clients (J. A. Hayes, 2002).

Inadvertently, some students will arrive seeking to correct and resolve difficulties from early childhood and sometimes even more recent life experiences; others will arrive to the training environment psychologically intact only to experience "wounding" by the new experience and psychological challenges and stress and strain involved in training and overexposure to problems within humanity (Miller, Wagner, Britton, & Gridley, 1998). Regardless of students' initial psychological status, the literature overall tends to support the premise that the nature of training and the role of counselors require the most effective training models to have a clearly defined objective to address heightened distress related to trainees' histories and affective and behavioral responses to training. Osborn (2004) recommended the inclusion of content that specifically attends to the development of the stamina, the endurance, and the strength to withstand, resist, or hold up under pressure of difficulty (Thomas, 1982). The objective of doing so would be twofold: (a) to facilitate optimal levels of skill development and (b) to teach trainees to practice effective preventative self-care (Cushway, 1996; Ungar, Mackey, Guest, & Bernard, 2000; Wolgien & Coady, 1997).

Researchers have found that counseling skill attainment during training, particularly after exposure to the Skilled Counselor Training Model (SCTM; Smaby, Maddux, Torres-Rivera, & Zimmick, 1999), does affect trainees' personality (Crews et al., 2005). The SCTM is the result of the fusion of two models: (a) Carkhuff's (1987) Human Resource Training/Human Resource Development Model (HRT/HRD), based on Toukmanian and Rennie's (1975) core conditions of counseling, and (b) the Microcounseling Skills Training Model (Ivey, Normington, Miller, Morrill, & Hause, 1968). Smaby & D'Andrea (1995) suggested that counselor skill training could, in fact, result in changes in trainees' interpersonal styles and ways of self-monitoring and, therefore, be therapeutic for both the clients to whom they are exposed and to the trainees themselves in their personal development.

Nevertheless, counselor educators must be cautioned not to assume full responsibility for trainees' psychological well-being and development. The severity and depth of some more debilitating personal issues exhibited in the training environment may not be attended to by the very nature of the training environment, and may in fact be exacerbated by training. Downs (2000) found trainees' experiences as clients to have a significant effect on both counseling self-efficacy and competence. Considering counseling as a viable option would therefore seem meaningful to the process of developing counseling competence and moving toward the required professional stamina as previously defined.

Critical School Setting Issues

The fourth and final theme addresses a collection of issues that are the most recent, critical areas of concern for K–12 school settings and believed to require special awareness, knowledge, and skills that extend beyond CACREP curricular guidelines: pharmacology (Bauer, Ingersoll, & Burns, 2004; J. H. King & Anderson, 2004), addictions (Morgan, Toloczko, & Comly, 1997), sexual abuse (Kitzrow, 2002), HIV-AIDS education (Hunt, 1996), school–family partnerships (Bryant, 2005), violence in the schools (Aspy et al., 2004; D'Andrea, 2004; Newman-Carlson & Horne, 2004; D. C. Smith & Sandhu, 2004), and grief and dying (Hodges, 2005). These were not the only school issues that were identified as important, and for the purpose of space, the list is not exhaustive and is intentionally limited. Most of these topics will require a need for attention in supervision and training during practicum and internship; however, some may not. Consequently, the existence of an unlimited list further supports the necessity of all trainees to understand the limitations of master's level training specifically

attending to all potential issues with which they might be confronted in service delivery. Trainees must be initially informed during orientation of the limitations and prepare themselves to assume responsibility for continued education to remain informed and abreast of critical issues in the school setting. In addition, students may also choose electives during training that will highlight a specialty area noting one of the missing pieces in their training experience, which can make them more knowledge about a particularly content area and, therefore, more competitive within the world of work.

On the other hand, counseling programs can also attend to the content deficiencies in a number of ways: periodically providing in-service workshops based on the results of surveys of the needs of practitioners within surrounding community schools; current students, who have developed a specialty area in terms of knowledge of the literature and course work, may work with faculty to develop and lead a workshop for current practitioners; local practitioners, having expertise in specific areas, might be invited to attend brown bag faculty–student meetings; and faculty may develop a file accessible to students of all local speakers conferences and workshops addressing critical issues in counseling. These are only a few suggestions regarding the how-to of strategically addressing critical issues that cannot be more comprehensively covered within the parameters of the program curriculum.

The essential, strategic, and periodic compilation and processing of continually evolving perceived training programs could eventually lead to a body of knowledge and recommendations for training that will eventually result in the equivalent of a doctoral degree. However, there are a number of training models wherein counselor educators have made some concerted effort to extend training curriculum and practices beyond the minimum CACREP standards in order to attend to the many recommendations in the literature toward training enhancement. In the next section, master's level education will be briefly discussed and suggestions identified in the literature for the improvement of the training of school counselors.

Master's Level Training in School Counseling: Strategies for Extending Beyond Minimum Training Guidelines

In making any attempt to attend to the seemingly ever increasing list of recommendations from counselor educators, counselor-trainees, and the K–12 school setting, a brief review of the literature specifically addressing standard practices within master's level training programs is essential. This is particularly important as we are confronted with a trend for some programs and state regulations are choosing to increase the required number of credit hours from 48 (CACREP minimal requirement) to 60 credits, which is more associated with specialist degrees. Before describing master's level training models, this section describes the distinct process of master's training, presents strategies in the literature that purport to enhance standard information dissemination and increased preparation for master's entry level positions, and notes recommendations for future research.

The Process of Master's Level Counselor Education

Gordon (1990) described the role of graduate education as exploring, advancing, and determining the parameters of knowledge in a particular field. As indicated in the prior section, Hirt and Muffo (1998) added that graduate level professional programs are more often than not guided by professional disciplines such as the state and national accrediting agencies (e.g., CACREP) than by institutional standards. Master's degree curricula have typically been designed to train counseling students for entry level positions in schools (CACREP, 2001; Zimpfer, Cox, West, Bubenzer, & Brooks, 1997), they tend to emphasize skills and training over theory and scholarship (Nelson & Jackson, 2000), and they prepare students for careers to meet the needs of the marketplace (Association of American Universities, 1998; Syverson, 1996). However, very little empirical research has specifically examined the process through which these outcomes are pursued.

In a review of the literature, Nelson and Jackson (2000) found few descriptive studies that concerned the academic environments of either doctoral or master's levels counselor education programs (Boes, Ullery, Milner, & Cobia, 1999; Schmidt, 1999; Zimpfer et al., 1997). Given the professional trend toward increased expectations of school counselors in terms of both knowledge and competence as they begin entry-level positions, it would seem imperative that we as counselor educators are clearer about the distinctive parameters and nature of master's and doctoral level training experiences. Identifying the differences will provide some guide toward increasing our awareness of the direction for shifts in future instructional and training practice.

Master's and doctoral level training experiences. In a qualitative study of counselor educators who had extensive experience (10 or more years) with both master's and doctoral level CACREP-accredited counselor education programs, Nelson and Jackson (2000) compared the training process issues uniquely associated with master's and doctoral level programs. Findings indicated that faculty associated with doctoral programs prepared students for

advanced professional leadership in teaching, clinical practice, supervision, and scholarship/research (e.g., CACREP, 2001; Zimpfer et al., 1997); had greater contact with trainees in the roles of mentor and collaborator in their professional development (CACREP; Hirt & Muffo, 1998); provided opportunities for engagement in numerous experiential learning activities; provided a learning environment based on a cohort model, which facilitated group cohesiveness and a sense of family (Boes et al., 1999; Hirt & Muffo); and in course instruction, expected students to focus on process, engage in higher order thinking, consider multiple perspectives of materials presented, and question their own and others' beliefs and knowledge. In contrast, faculty associated with master's programs highlighted beginning counseling skill acquisition; provided fewer opportunities for students to select electives; taught courses which were didactic, content driven, and survey in nature, involving the transmission of knowledge from the professor to the student; perceived students as consumers; reported less time with students; and had clearer boundaries between their role in the advisor–advisee relationship.

Given these stark differences, in order to meet the challenges in attempts to attend to the numerous recommendations in the literature discussed in the first section of the chapter, counselor educators must begin to creatively interject as best we can doctoral level training philosophy into training master's level school counselors. Although not explicitly stated in terms of transforming master's level training through infusing the doctoral level training process, a number of authors have recommended and used strategies that attend to the need for this transformation. The following section lists a few of such strategies that serve as a bridge toward new guidelines for training experiences in master's level counseling programs.

Strategies for Infusing Doctoral Level Training Process Into Master's Level Programs

More in-depth interaction with and mentoring from faculty. Faculty must provide counselor-trainees with significant time for ongoing and regular feedback and discussion so that students can work on areas in need of growth and development (Stoltenberg, McNeil, & Delworth, 1998; Vespia, Heckman-Stone, & Delworth, 2002). Jordan (2002) supported this strategy to assess students' readiness for training, to assure the quality of students' work, to encourage students' professional development, to more accurately evaluate students' professional competence, and to supply early identification and intervention with identity impaired student counselors. This ongoing and more extensive feedback from faculty will provide trainees with the kinds of information and learning that will facilitate growth in terms of counseling skills, enhance progress in professional identity, and assist in their ability to compare and contrast their thinking and responses with those of the more experienced senior members of the profession that they wish to enter (Deal, 2003).

Movement toward the inclusion of both didactic and experiential learning modes of instruction. Faculty must provide counselor-trainees with multiple opportunities for experiential learning that will allow time for personal introspection and reflection on how their person variables influence interactions and affective/behavioral responses to others within the cohort, to feedback regarding progress in counseling skill development, and to client issues discussed (Akos, 2004; Kim & Lyons, 2003; Parker, Freytes, Kaufman, Woodruff, & Hord, 2004) and that will allow them to integrate prepracticum curriculum and learning activities in a manner that approximates their roles as practitioners (Prieto & Scheel, 2002). The body of literature that emphasizes experiential learning in counselor education primarily attends to this as a strategy to enhance multicultural awareness about issues of diversity in the terms of structured exercises and games designed for this specific purpose, whereas the other body of literature identifies experiential learning as a means to facilitate the development of skills directly related to service delivery such as competence in case conceptualization and group counseling. At this time, recommendations for the use of the infusion of learning through experience appears to be limited, fragmented, and focused on individual areas of competence. Nevertheless, the merit of recommendations for training to move in this direction appears worthy of attention as we rethink the process of master's level counselor education given the positive correlation found between experience in an activity and counselor self-efficacy and the negative relationship with trainees' anxiety (Barbee et al., 2003; Tang et al., 2004).

Use of technology in replacement of more traditional modes of information dissemination. As in all arenas of personal and professional lives of many individuals in the United States, the use of technology in the field of counseling has emerged and continued to evolve (Baggerly, 2002; Baltimore, 2002; Quinn, Hohenshil, & Fortune, 2002). The existence of an online journal, the *Journal of Technology in Counseling*, which began in October of 1999 and was designed to specifically focus on this topic, is evidence of the emerging importance of technology within this discipline. Recommendations for the use of technology in counseling can be divided into two different foci: (a) use in service delivery and (b) use in counselor education and skills development. Literature supporting the link of technology with service delivery within the schools highlights the following areas: a means of advocacy (Stone & Turba, 1999), career counseling service delivery (Kuo & Srebalus,

2003; Pelling, 2002), assisting collaborative efforts between school counselors and special educators (Crutchfield, Baltimore, Felfeli, & Worth, 2000), and scheduling (e.g., aSc TimeTables, SchoolWorks, Daymark Software Systems, and Management Information Group–SIRS 3).

Recommendations for use in counselor education and skill development are to be more expansive and include teaching group counseling competence (Krieger & Stockton, 2004); connecting theory and practice through exposure to model videotapes (J. Carlson & Kjos, 1998); multimedia instruction in training counselors (B. G. Hayes, 1999); facilitating counseling skill development (Casey, 1999); counseling assessment (Lundberg & Cobitz, 1999); transcultural counseling education (McFadden & Jencius, 2000); instruction of counseling techniques (Jones & Karper, 2000); instruction teaming of school counseling, special education, and social work trainees (Stone & Seabrooks, 2000); supervision training (Barnes, Clark, & Thull, 2003; Getz & Schnurman-Crook, 2001; Pelling & Renard, 1999); distance learning in counseling education (Woodford, Rokutani, Gressard, & Berg, 2001); promoting active learning in training programs (Baggerly, 2002); and presenting online assignments (Clark & Stone, 2002). In addition, faculty are also beginning to more frequently use technology as a component in the process of data collection in both qualitative and quantitative research designs (McGlothlin, 2003).

There are a number of implications for the increasingly more common use of technology within the field of counseling. First, it presents one more component that counselor educators must use in training in order to best prepare students for the world of work. Graduates must at least know of programs with some degree of awareness of the role of technology within counseling. In addition, the relatively new role of technology in training will require some faculty to become more familiar with the strategic use of technology in order to be more effective and efficient in curriculum development, in classroom instruction, and in supervision. Technology can be one of the keys to freeing faculty classroom time, which has previously been reserved for lecture or examination, to engage in more meaningful discussions facilitating critical thinking skills among students about the content within the context of their roles as school counselors.

The integration of a developmental, across the life span, emphasis. Ivey and Goncalves (1987) suggested that counselors maintain the distinctiveness of being a specialized profession separate from psychology and continue to integrate developmental theory systematically into the curriculum and into the practice of counseling. Paisley and Benshoff (1996) and Akos and Galassi (2004) purported that school counselor education program faculty must use contemporary developmental research to train counseling students to serve as developmental advocates, whose primary role is to promote positive student developmental outcomes, and the research identified types of environments that nurture those outcomes. In addition, the emphasis on human development has extended to the critical training issue of professional development, more specifically, counseling supervision (Murray, Portman, & Maki, 2003; Nye, 2002; Vespia et al., 2002). No longer is it assumed that good counselors will make good supervisors; however, the link between the two professional activities, which highlight human development, has been respected and maintained (Bradley & Ladany, 2001; Milne, Pilkington, Gracie, & James, 2003). Human development remains a mainstay of distinction within the profession and this prominence is reflected in that it is a course requirement included in the 2001 CACREP guidelines as well as in the list of required course work for many state boards of counseling.

Although the concept of human development is firmly implanted as a point of attention in service delivery and training, there are a number of traditional curriculum, practices, and policy guidelines that result in limitations to the relevant knowledge in this content area. First, usually, attention to development in curriculum is too often relocated to the primary focus of one course and tangentially addressed within syllabi across core curricula. Theory and knowledge are seldom presented together in such a manner to assist in training's being able to effectively move from knowledge to application. Second, when students are exposed to developmental course work, trainees are seldom prepared for the role of supervisee and, eventually, supervisor (Vespia et al., 2002). Human development, in general, is addressed, but not associated with the experience in training. Without exposure to this body of knowledge, increased anxiety and misuse of the supervisory relationship may ensue (Bradley & Ladany, 2001). Third, some trainees arrive wishing to major in only one development stage. For example, some school counselor-trainees purport to feel comfortable with only a specific age group and choose to enroll in courses that attend to that stage. In addition, we have found that some students who choose school counseling as a career goal wish not to develop any competencies in work with adults. This decision is too often supported by program policies that support trainees in their decision to do so by maintaining complete separation between school counseling practicum sections and nonschool practicum sections. Such students are not challenged to attend to personal issues that they have with older or younger adult populations, and through choice, they are not exposed to training experiences wherein they are able to observe and develop the adult-to-adult or adult-to-child competencies. Such an outcome can impede the development of interpersonal competencies that are associated with assuming the role of effective student advocate

with teachers, administrators, parents, or guardians. Not attending to human development in the most comprehensive manner could certainly be considered a debilitating influence in training programs that intend to prepare the most competent practitioners in the school setting.

The literature seemingly presents with clarity the necessary training content and process toward the development of the best prepared and most effective school counselors. However, there is also somewhat of a mixed message in that there is not currently a well-defined strategy for attending to the recommendations. For example, the national models developed by the profession were not intended to present an ideal program that could be used as a standard throughout the nation, but to provide school counselors with a document that would institutionalize the framework of a comprehensive school counseling program (Hatch & Bowers, 2002). With this in mind, it is no surprise that survey results indicate a great deal of variability in how and to what degree counselor educators implement the standards and literature in curriculum development, program practices, and policies (Perusse et al., 2001). Consequently, at this time, each individual program faculty body has the responsibility to attend to the challenge of developing, based on local demographic needs and political conditions, personalized programs that infuse recommendations from the literature and professional associations into students' training experiences (Hatch & Bowers). Although there may be as many different training models as there are training programs that purport to attend to both process and content recommendations within the confines of the structure of master's level training (e.g., Adelman & Taylor, 2001; Clarini & Greenwald, 2004; R. M. Hoffman, 2001; Johnson & Johnson, 2002), at this time, very limited literature identifies and specifically describes the content and process of training programs that do so in a comprehensive manner. The following section presents a case description of one school counseling training model that purports to do just that by attending to and extending beyond the current minimal standards as identified by the CACREP.

The Michigan State University School Counseling Training Model (MSU-SCTM): Extending Beyond the Minimum Standards

Graduate programs in school counseling are being reconstructed to facilitate the development of counselors-in-training who have the necessary information and skills to address the needs of a rapidly changing society. This section presents one CACREP-based, school counselor education program's curricular organization and structure designed to emphasize the integration of theory and practice in the process of simultaneously attending to the previously discussed, cutting-edge recommendations in the literature and guidelines established by professional organizations. The intent of the curriculum organization is to provide students with experience in assuming basic professional tasks associated with service delivery in school settings prior to real contact with K–12 student populations.

The Program Description

This two-year, cohort-model, CACREP-based, 48-credit-hour school counseling program is located in a large Midwestern state institution of higher education. Each year, 18 to 25 trainees are selected from a pool of 50 to 100 highly academically competitive applicants from around the world. Admission occurs only once each year during the fall semester. The program has consistently high graduation rates, has successful professional placement of graduates, and has a longstanding, successful admission of graduates to accredited doctoral programs (e.g., counseling psychology, counselor education, psychology, organizational psychology, and educational policy).

There are three program faculty, and all have doctoral degrees in counseling psychology; are members of ACA, the state Counseling Association, and the American Psychological Association (APA); have some experience of service delivery and research in the school setting; have research, scholarship, and service delivery experience associated with issues of diversity; and have developed program policies and practices that attend to the minimum standards of training exhibited in CACREP, the components of the Missouri Comprehensive Guidance Model, and the ASCA Counseling Program Guidelines.

The following sections provide an overview of the most defining characteristics of the program's pedagogy, curriculum integration, unique training components, and potential limitations of the program practices.

Pedagogy and counselor education. *Pedagogy,* the work of the teacher, is the systematized and strategic instruction of principles that promote students' learning. *Content pedagogy* refers to the teaching skills used to impart the specialized knowledge/content of the subject areas. Effective teachers display a wide range of skills and abilities that lead to creating an effective learning environment. Delineating effective practice and recognizing those who achieve it are important first steps in shaping the kind of teaching professional that America needs. This is the core challenge embraced by the National Board for Professional Teaching Standards (NBPTS; 1998), which recognizes that teaching is at the heart of education and the single most important action the nation can take to improve schools

is to strengthen teaching. We believe that this is the core challenge that should also have some utility for counselor educators.

This language is borrowed from teacher education and is seldom addressed in the development of school counseling curriculum or recommendations for training, which tend to overlook the how-to and highlight the inclusion of content. Nevertheless, school counselor educators must address pedagogical and programmatic concerns if effective training process and outcomes are to result (R. M. Hoffman, 2001). We believe that for the best training outcomes to ensue, a clearly defined teaching philosophy to which all program faculty members must adhere is mandatory.

Teaching philosophy statement. In the introduction to the 30th anniversary edition of Brazilian educator Paulo Freire's *Pedagogy of the Oppressed*, Richard Shaull (1970) suggested that education has the capacity to facilitate students' abilities to accurately interpret and transform reality toward becoming effective social change agents. The central factors are the ability to challenge internalized images of established ways of life and the understanding of how to critically develop creative solutions to ill-formed problems. Attending to students' baseline competencies and knowledge and providing adequate support and challenge, teachers must provide conditions that allow counselor-trainees to develop knowledge, skills, and cognitive capacities necessary for dealing with complex social issues in the school setting (Kohlberg, 1975).

Although Freire's (1970) pedagogy provides an overarching frame for this program's model of training, faculty members have more specifically integrated components of a number of theories and models to facilitate the development of objective and effective social change agents. Developmental theory is perceived as critical to training in that faculty recognize and facilitate trainees' progress toward counseling competence (Stoltenberg & Delworth, 1988) through integrated curriculum, extensive and ongoing evaluations of counseling competence, and movement from self- to other evaluation of counseling competence. Phenomenological philosophy serves as the underpinning of the requirement that both faculty and students review and critique their videotaped counseling sessions and typewritten transcripts by using Kagan and Kagan's (1990) Interpersonal Process Recall. The Discrimination Model (Bernard, 1979; Luke & Bernard, 2006) is reflected in trainees' being provided with a map to critique the efficacy of their work with clients (e.g., process skills, conceptualization skills, and personalization skills). Finally, there is in-depth attention to the personal growth approach (Griffith & Frieden, 2000), which is person-centered and emphasizes heightening trainees' self-awareness, insight, and control of their own feelings and behaviors through requiring psycho-socioemotional self-assessment and development of a personal treatment plan.

Faculty members in this program have adopted a teaching style to inspire personal introspection and consciousness raising and to facilitate heightened understanding of personal values and the well-being of others. Students are challenged through use of what Freire (1970) called a "problem-posing" approach in which learning evolves from experiences that arouse interest, enjoyment, and challenge in the immediate experience of the student. Change in how a student knows is perceived as originating from movement from experience to thought and back again to construct and organized experience—what Schon (1987) referred to as "knowing in action." In this regard, teaching and learning are considered forms of research and experimentation and of questioning what is known in relationship to the problem-posing situation.

All core program faculty members have adopted this teaching philosophy in the development of course syllabi and classroom structure. The training environment and in-class experiences reflect each of Freire's (1970) philosophical main points: active, interactional, and participant learning opportunities; emphasis on acknowledgement of diverse perspectives; opportunities to learn how to effectively think critically about issues discussed; opportunities to become adaptive toward greater cognitive and behavioral flexibility; and extensive opportunities for self-assessment and heightened self-awareness. Students are reinforced to see themselves as agents of systemic change who are committed to improving themselves, their student cohort and training environment, the profession of counseling in terms of service delivery and research, their families, and the communities in which they live.

Core curriculum is based on national standards and the CACREP minimum standards guidelines; individual core course structures and required activities allow students opportunities to actually experience professional tasks associated with service delivery and practice within the school setting. For example, in the instruction of the course addressing individual counseling skills, students not only are exposed to the literature (knowledge) associated with skill acquisition, but are also allowed multiple opportunities for practice, which includes faculty, self-, and other evaluation of competence. Students have the opportunity to interface with program alumni and practicing school counselors during the first year of enrollment before the practicum experience. Both students and faculty are continuously informed of the needs within the current K–12 population. Technology is used in the dissemination of information and reading, and didactic and experiential learning are both used as modes of instruction and training.

Standard-based integrated curriculum. Often the applicability of effective educational models is identified and developed by faculty for primary implementation in the K–12 setting (Beane, 1993). Curriculum integration, one such model, has long been proposed as a way of organizing the common learnings or professional life skills considered essential to effective functioning in a life setting (Beane, 1997; McAuliffe & Eriksen, 2000). The primary objective is to assist students in making sense out of their experiences and learning how to participate in a democracy (Beane, 1997). Although the utility of such a model based on the professional standards of school counselors and counselor education programs would have the same benefits and positive outcomes in graduate education programs, few counselor education programs have attempted to strategically develop integrated curriculum in the training of school counselors (Hoachlander, 1999). The implementation of professional, standards-based integrated curriculum in K–12 instruction, having the goal of attending to student achievement in learning environments, has been significantly linked with increased mastery of much higher levels of knowledge and skill and with applying it in a coherently defined domain of the world of work (Gardner, 1993). The faculty members in this program have assumed that similar outcomes will occur in professional, standards-based integrated curriculum in counselor education graduate programs. Curriculum integration occurs at a number of levels within the MSU-SCTM. The following sections describe the levels of integration of training experiences that not only attend to professional standards, but also address the issues raised in the literature.

Integration of standards within course content. Increasing students' self- and other awareness and attitudes about individual differences is a critical recommended component of all counselor education training environments. In each of the required core courses related to service delivery, trainees experience the role of counselor and of faculty-constructed client in mock, videotaped counseling sessions in which evaluation and feedback based on professional standards and effective skill implementation are critical components of the training exercises. For example, in the diversity course among the first-year cohort, in their work with one another, students are requested to assume the roles of critical issues with which they will be confronted in the school setting (e.g., ADHD, substance abuse, parental physical abuse and neglect, anxiety, career counseling, academic underachievement) and special populations (e.g., racial-ethnic minority populations, GLBT students, gender issues, religious and spiritual issues) and to utilize effective multicultural counseling skills in work with their clients. Students develop knowledge and competencies in addressing legal/ethical issues with clients, effectively develop rapport, collect relevant information, write comprehensive progress notes, experience consultation, and develop a critical evaluation of counseling competence. This kind of activity allows students to experience a faculty guided, practicum-like, small group supervision experience prior to contact with actual clients.

Integration of curriculum/training across core courses. During the first semester, students enroll in three required core courses: (a) Individual and Group Counseling, (b) Multicultural Counseling, and (c) Counseling Theories and Ethics. The mock counseling sessions described in the previous section provide the crux of the training experience. Students are required to implement microcounseling skills learned and modeled in training videotapes in a culturally sensitivity manner in their work with their clients in the school setting. In addition, trainees are required to attend to legal/ethical issues that arise in their cases, presenting standard- and/or ethical-guideline-based rationales for their decision making and to conceptualize their clients presenting problems from multiple theoretical perspectives. The instructors of courses addressing each domain review the materials, but assume responsibility for evaluating and grading the final products based on the degree to which students attend to the standards presented in their perspective courses.

During the second semester of enrollment, trainees enroll in a career counseling course and are required to develop a school program module for implementation and evaluation during practicum the following fall semester of their second year of enrollment. Also during the second semester of enrollment, trainees enroll in two courses: (a) Counseling Assessment and Diagnosis and (b) Counseling Strategies. Training videotapes exhibiting model counseling strategies and clients with specific diagnoses are used to enhance trainees' understanding strategy implementation and clients' presentations of self within the counseling relationships. In work with videotaped mock counseling sessions, students collect relevant information and are required to select assessments, interpret results, develop DSM diagnoses, and identify the appropriate comprehensive treatment plans and literature-based strategies for intervention. Ongoing small group supervision sessions provide a forum for case presentations, consultations with colleagues and faculty, evaluation, and feedback. Trainees' products include a comprehensive formal write-up of all course requirements.

Integration of curriculum/training across first- and second-year student cohorts. During enrollment in practicum, trainees receive selected reading addressing counseling supervision and serve as secondary supervisors to first-

semester students as they develop multicultural counseling competencies through the use of microcounseling skills in mock counseling sessions with one another. All training experiences are videotaped, which result in typewritten transcripts having both counselors' and clients' responses. Although faculty members in Individual and Group Counseling and Multicultural Counseling provide written feedback, practicum-level secondary supervisors review videotapes and transcripts and meet with trainees to assist them in preparation for improvement in their work during the final taped session of the semester.

During enrollment in internship, trainees serve as role-playing clients to the students who are enrolled in Counseling Assessment and Diagnosis, and Counseling Strategies as just described. Interns select cases and assume the role of clients with whom they have worked during practicum or with whom they are currently working. Multiple sessions begin with an intake interview and end with a final session that concludes with a supervisory session in which the intern discusses the counseling process and outcome, which includes a sharing of perspectives of strengths and limitations of the trainees' competence. The client also provides a formal evaluation of the counseling relationship and counselor effectiveness.

Finally, at the end of the semester of practicum, students participate in a panel discussion with the intent of preparing and guiding first-year students through the process of identifying a practicum site and the experience of practicum. In response, first-year students, who have almost completed their first semester of enrollment, develop and present papers describing their experiences in attending required professional development activities to the entire student body.

Integration of curriculum/training with community counseling curriculum. All students share core coursework that addresses both school and community literature, but the students are required to develop products that are associated with the setting in which they plan to work after graduation. For example, school counseling students will have clients and client cases associated with the school setting; those in community mental health will have client cases associated with community mental health. In order for trainees to have some understanding of service delivery and practices that extend across settings and developmental stages in work with children, adolescents, and adults, small group mock supervision activities are integrated, as are practicum and internship sections. Differences between the two programs are indicated in course products, practicum and internship placement site selection, and the selection of electives.

Unique model components that extend beyond the professional guidelines. The following provides a list of the components of the training model that further distinguish it from the common practices of most training programs: all core course work addresses issues related to development across the life span in addition to the CACREP required developmental course recommended; all core course work addresses issues of diversity in addition to the CACREP required diversity course recommended; a Program Diversity Model is designed to provide guidelines for sensitively attending to "cross-cultural collisions" (Steward, Gimenez, & Jackson, 1995) that occur during training; the program uses ongoing jury evaluation of trainees' counseling competencies; the program provides opportunity for research team participation and professional presentation/publication; the program provides a structured longitudinal programmatic research program for evaluation of training and faculty–student scholarship, wherein admission packet information and student course products during training are considered data for analysis; students engage in numerous opportunities to develop competence in self- and other evaluations of competence in professional activities; and the program provides extensive and ongoing supervision of trainees' counseling competence development throughout enrollment in the program. One of the most recent additions to the curriculum in the Counseling Strategies and Assessment courses is students being required to complete psychological measures that they would require of future clients, write an interpretation of the results and how the results will influence their experiences within the training environment and with future clients, and develop personal treatment plans that describe strategies they would use to self-monitor the issues that are revealed. This activity was designed to heighten students' senses of awareness and personal and interpersonal understanding and to increase their senses of responsibility to self-monitor personal issues that may negatively influence relationships within training and professional environments. Students' understanding of the intricacies and sensitivities of the assessment and interpretation process increased, and the outcome positively influenced small group discussions of mock counseling sessions.

Future planning toward a more comprehensive model of integration. Because this is a training model in progress, faculty members' continue to plan for continued enhancement of program curriculum and training practices through extension of the description of training during practicum and internship. First, extending practicum/internship sites to include the formal development of a trainee-instructed, faculty-supervised course that addresses students' academic achievements and skills for student success will allow students the direct instructional experience with the K–12 student population that is typically missing within

training programs. Second, the inclusion of an on-site research experience and resulting publishable paper during internship would most directly address the researcher–practitioner model discussed in the literature. Third, in light of state legislation that removed teacher certification as a requirement for endorsement as a school counselor, faculty are currently also discussing the merit of requiring school counseling students to apply and serve as substitute teachers prior to program completion. Fourth, offering on-site practicum and internship supervisors opportunities for training in counseling supervision will provide a service to the community, establish a stronger and better integrated faculty–practitioner and university–community bond, and enhance the training experience of current and future students. Fifth, conversations are currently beginning to develop integrated training experiences across faculty related to other disciplines within the school setting (e.g., school psychology, teacher education, social work) in order to develop awareness of the parameters of knowledge of competence and increase awareness of the process of consultation toward effective treatment plans and subsequent positive student academic outcomes. Use of the findings from the longitudinal research program self-study will provide the basis for continued program enhancement and student training outcomes.

Limitations of the Training Model

Composition of student cohort. Although most student cohorts admitted have a critical representation of diversity in terms of race and ethnicity, the structure of the program tends to attract students whose lifestyles are more amenable to full-time enrollment given the nature of the integrated curriculum. Trainees tend to be female and between 22 and 32 years of age with limited professional experience after completing their undergraduate degrees. Therefore, the model does not accommodate other applicant populations, who may seek degree completion on a part-time, more long-term basis. The generalizability of this model to other student populations may not be feasible.

The challenge of the integration of curriculum and training model pedagogy. To be effective, an integration activity must accomplish an important, well-defined educational objective, emphasize connections and context, demand extensive faculty time commitment (Hoachlander, 1999) and must be dependent on the close, ongoing collaboration and consultation among program faculty in the development of syllabi, instructional styles, and standards for evaluations. Faculty must not only be aware of all professional standards but also, to some degree, be like-minded in terms of criterion used in evaluation of students' competencies, which can be a somewhat subjective process. This is particularly the case wherein multicultural counseling competence is evaluated and faculty members' personal biases and attitudes may be in direct opposition to those of other faculty members. In spite of the positive outcomes associated with integrated curriculum, these may be substantial obstacles to making it a more common practice in training programs, especially without a formal commitment to adhere to a diversity model designed to specifically address point of differences.

Professional identity of faculty. Despite an increasing concentration of counseling psychology programs within schools of education (80% today, as opposed to 50% in the mid-1980s; M. A. Hoffman & Carter, 2004), Pope (2004) noted that counseling psychology has shifted from a connection to master's level practice and the field of counseling to an emphasis upon doctoral-level practice and an emphasis upon the field of psychology. As this shift occurred, counseling psychology and counselor education competed for scarce resources within universities and developed distinct accreditation standards, award systems, ethical codes, and licenses for practice, creating some tension between these two fields. Counseling psychology also began to move away from its historical role in schools (Neimeyer, Bowman, & Stewart, 2001) and became more isolated from counselor education in order to meet the distinct demands of APA accreditation (Galassi & Akos, 2004). However, recent special issues of *The Counseling Psychologist* (cf. Romano & Kachgal, 2004; Walsh & Galassi, 2002) have revisited the role of counseling psychologists in our schools and, considering the natural fit between these two fields, have suggested that counseling psychologists may play an important role in the training of school counselors.

This historical divergence between counselor education and counseling psychology is reflected in the scholarship of these fields. Pope (2004) noted that although counseling psychologists routinely publish in counselor education journals, counselor educators do not encounter a "two-way" street in publishing within counseling psychology journals. Relatedly, Whiston (2002) noted that only 2 of the 25 editorial board members of *Professional School Counseling* are from counseling psychology programs.

Coleman (2004) noted that many counseling psychology training programs have made it difficult for graduates to become involved in schools and in the training of school counselors. For example, he noted the lack of child/adolescent-friendly counseling psychology doctoral programs, the lack of sequential school counseling course work for counseling psychology graduate students, and the lack of counseling psychology role models who were involved in the schools or in school counseling that leave few counseling psychology graduates prepared to direct a school counseling program.

Despite this trend, several counseling psychologists have taken active roles within schools and in the training of school counselors. For example, the "Achieving Success Identity Pathways" and "Tools for Tomorrow" career development interventions have had a significant impact upon the educational and vocational development of students in urban schools (Solberg, Howard, Blustein, & Close, 2002), in addition to providing counseling psychology graduate students with valuable experiences within our schools. Relatedly, Kenny, Waldo, Warter, and Barton (2002) and Walsh and Galassi (2002) both articulated and demonstrated the roles counseling psychologists may play within schools, such as in coordinating educational and social services or delivering mental health services within underserved schools.

The active roles these counseling psychologists have taken within schools reflect Romano and Kachgal's (2004) argument that "the influence of the two specialties [counseling psychology and school counseling] will be eminently stronger if they can form a strong partnership based on their overlapping philosophical foundations, scientific investigations, and psychological practices" (p. 184). They suggested that the theoretical and conceptual training of counseling psychology and school counseling is similar and that the theoretical foundations of counseling psychology can be helpful in training of school counselors. For example, the emphasis upon development, career development, and contextual bases of behavior and prevention (among other domains) within counseling psychology are well suited to the training and professional practices of school counselors.

Counseling psychology's emphases upon multiculturalism and research are also well suited to address school counselors' needs in our current context of accountability within schools. In particular, the Education Trust and the ASCA's (2003) model emphasizes school counselors' addressing the need of traditionally underserved students, such as racial/ethnic minorities, and closing the gap in academic achievement between White students and students of color. Counseling psychologists would be well suited to address issues of cultural identity and its relationship to academic performance among students of color and could train school counselors to understand these relationships, models of racial/ethnic identity development, and facilitate the cultural competence of counselor-trainees (Coleman, 2004). Relatedly, the research skills of counseling psychologists could be applied in training school counselors to utilize data and evaluation to drive decision making and advocate for the impact of school counselor within school systems (Whiston, 2002). For example, counseling psychologists could train school counselors to use research design skills to evaluate the impact of guidance programs upon the academic achievement of students of color and in closing the gap in academic achievement. In sum, considering the external threats faced by both counseling psychology (the closing of prominent doctoral programs) and school counseling (the recent trend of losing guidance counselors and programs), we suggest that the mutual benefits to these parties, in addition to the benefits students would receive, far outweigh historical tensions between these two fields.

Summary

To ensure the best outcomes in the training of school counselors, counselor educators must accept that it is an ever-evolving process that requires periodic review of the critical issues within the schools; ongoing contact with practitioners within the school settings; systematic, well-constructed, empirical research examining both process and outcome; and careful attention to the needs and issues that trainees bring to training. An updated literature review addressing professional standards in both practice and service delivery is incomplete without some attention to the parameters of restrictions associated with the master's degree. To prepare trainees who will be able to best meet the needs of children, teachers, and staff in the 21st century, there must be some understanding of how we must move to more effectively and efficiently incorporate what we must and can into the structure of training programs. This review and model of training, though quite comprehensive, is only a beginning to our fully understanding the process through which the necessary content and professional experiences can be infused into master's level training programs.

III
SCHOOL COUNSELING: Moving Toward Standards and Models

CAROL A. DAHIR
New York Institute of Technology

> Today, in most high schools, counselors are not only expected to advise students about college, they are also asked to police for drugs, keep records of dropouts, reduce teenage pregnancy, check traffic in the halls, smooth out the tempers of irate parents, and give aid and comfort to battered and neglected children. School counselors are expected to do what our communities, our homes, and our churches have not been able to accomplish, and if they cannot, we condemn them for failing to fulfill our high-minded expectations.
>
> **(Boyer, 1988, p. 3)**

For too many years, and for as long as the school counseling profession has existed, the scope and sequence of services delivered have been defined and influenced by forces outside of the profession more than by the profession itself (Dahir, 2001, 2004). State departments of education, school district administrators, and educational organizations and foundations have clearly dictated the functions, activities, and programs that professional school counselors should deliver to students (Cunanan & Maddy-Bernstein, 1994). School counseling programs were perceived as a collection of well-intentioned responsive services based upon the professional orientation of the counselor, the priorities of an individual school building, and administrative needs (Campbell & Dahir, 1997). Confusion existed as to what actually constituted a school counseling program and what role the school counselor assumed in a school setting.

School counseling has been on a continuous journey of change since the inception of the profession in the 1890s. One hundred years later, a concerted effort initiated by the American School Counselor Association (ASCA; 1994) and the Education Trust (1997, 1999) focused attention on the essential dimensions for effective school counselors and counseling programs in schools as represented in Table 3.1.

Today's 21st-century, professional school counselor is a systemic change agent, who uses leadership, advocacy, collaboration and teaming, and data-driven decision making skills to "become the academic conscience of the school, insuring that the school remains focused on student achievement and accepts responsibility for student outcomes" (Hart & Jacobi, 1992, p. 49). As student advocates, school counselors support equity in educational opportunities for all students and nurture dreams and aspirations. School counselors embrace the ethical and moral obligation to reduce and eliminate the institutional and/or social barriers that may stand in the way of every student's academic, career, or personal/social development (Lee & Walz, 1998; Stone, 2005). The profession of school counseling has embraced changing times. It displays a willingness to analyze, monitor, and adapt the school counseling program to the changing educational landscape and the goals of school improvement. School counselors recognize and embrace the critical part they play on the educational team. They also accept the challenge to share in the responsibility to prepare students to meet the expectations of higher academic standards and help them become productive and contributing members of society.

It is not to say that school counselors did not previously embrace this way of work; ASCA and the Education Trust's efforts at the national level promoted the transformation of the profession in ways that complemented the national agenda to improve schools and equitably address every student's educational needs. Twenty-first century school counseling programs are in a proactive and pivotal position to effectively demonstrate how the complement of academic rigor and affective development is the formula to student success (Stone & Dahir, 2007).

Table 3.1 Traditional vs. Transformed School Counseling

The Practice of the Traditional School Counselor	The Practice of the Transformed School Counselor

National Standards: What Students Need to Know and Be Able to Do

At the heart of the national debate about education is simply what's working and what's not working in public schools. Since the publication of *A Nation at Risk* (National Commission on Excellence in Education, 1983), the education and business communities, and the public and private sector regularly deliberate the expectations of American public education. The school improvement agenda of the No Child Left Behind Act (U.S. Department of Education, 2001) evolved from the decades-old educational reform movement which is rooted in A Nation at Risk. America 2000 (USDE, 1990), and its reauthorization as *Goals 2000* (USDE, 1994) was the impetus for the development of national standards across all academic disciplines. Phrases such as "higher academic achievement," "increasing student potential," and "rigorous academic preparation," as well as the word *accountability*, have become commonplace in every community across the nation.

As the academic disciplines moved forward to develop statements of what "students should know and be able to do" (National Education Goals Panel, 1992, p. x). The development of the *National Standards* (Dahir, Sheldon, & Valiga, 1998) encouraged the school counseling community to look within itself to clarify its purpose and establish higher expectations for both students and the programs delivered. ASCA determined that the school counseling standards, like the academic subject standards, would define what K–12 students should know and be able to do as a result of participating in a school counseling program (Campbell & Dahir, 1997). ASCA believed that national standards would

- Promote equitable access to school counseling programs and services for all students,
- Identify and prioritize the key content components for school counseling programs, and
- Ensure that school counseling programs are comprehensive in design and delivered in a systematic fashion for all students (Campbell & Dahir).

A major research study was undertaken by ASCA in 1995 to analyze relevant school counseling and educational reform literature and to review existing school counseling program models developed at the state level. The findings confirmed the continued importance of the three widely accepted and interrelated areas of student development: (a) academic, (b) career, and (c) personal/social development (Campbell & Dahir, 1997). As a result of this work, the nine national standards (represented in Table 3.2) ensued. These standards offer school counselors, administrators, teachers, and counselor educators a common language to promote student success through school counseling programs, which also is readily understood by colleagues who are involved in the implementation of standards across other disciplines.

The National Standards for School Counseling Programs (ASCA, 1997) tied the work of school counseling programs to the mission of schools and encouraged school counselors to assume a leadership role in school reform (Bowers, Hatch, & Schwallie-Giddis, 2001). National standards-based school counseling programs are intended to help students develop attitudes, knowledge, and skills in academic, career, and personal/social development that are needed in today's and tomorrow's world. Higher expectations would also necessitate the development of new and different measures of school counseling accountability to evidence that the student competencies—and ultimately, the standards—are achieved. Measurable success resulting from this effort can be documented by an increased number of students completing school with the academic preparation, the career awareness, and the personal/social growth essential to choose from a wide range of substantial postsecondary options, including college (Education Trust, 1997).

Student Competencies

Expectations of student accomplishments or outcomes as a result of participating in a standards-based school counseling program are written in terms of student competencies. Student competencies support the goals of the *National Standards*, guide the development of strategies and

Table 3.2 *National Standards for School Counseling* Programs (ASCA, 1997)

Domain		Standard
Academic	A	Students will acquire the attitudes, knowledge, and skills contributing to effective learning in school and across the lifespan.
	B	Students will complete school with the academic preparation essential to choose from a wide range of substantial post-secondary options, including college.
	C	Students will understand the relationship of academics to the world of work and to life at home and in the community.
Career	A	Students will acquire the skills to investigate the world of work in relation to knowledge of self and to make informed career decisions.
	B	Students will employ strategies to achieve future career goals with success and satisfaction.
	C	Students will understand the relationship between personal qualities, education, training and the world of work.
Personal/ Social	A	Students will acquire the knowledge, attitudes and interpersonal skills to help them understand and respect self and others.
	B	Students will make decisions, set goals, and take necessary action to achieve goals.
	C	Students will understand safety and survival skills.

Note: From *Sharing the Vision: The National Standards for School Counseling*, Alexandria, VA: ASCA, 1997.

activities, and are the basis for assessing student growth and development. Competencies represent the specific knowledge, attitudes, and skills that students can acquire to support their academic, career, and personal/social success. The 122 ASCA student competencies are arranged in the three domain areas and provide the pathways to each, achieving the nine standards.

In addition to the concept of age appropriate and developmental needs, many sources influence the selection and formation of student competencies. State, district-level, and building-site comprehensive school counseling programs often include specific competencies or outcomes that are aligned with the school's or system's mission statement and the academic or curriculum standards, and are categorized according to elementary, middle, or secondary levels. Competencies that are identified through needs assessments and data analyses are pathways to documenting and demonstrating student growth and progress development to the achievement of the nine standards. School plans may identify the competency expectations by grade levels consistent with developmental expectations and local needs and priorities. The competencies are incorporated into a comprehensive, developmental school counseling program that emphasizes early intervention and prevention as well as responsive counseling services. Thus, they are delivered in the multitude of ways that school counselors provide services to students.

The ASCA National Standards and the student competencies provide a context for every student to acquire attitudes, knowledge, and skills. School counseling programs based on this framework advocate for a consistency in expectations for all students across all levels of education—elementary, middle, and high schools—and seek to close performance gaps among students from different economic classes, genders, races, or ethnic groups. Comprehensive national-standards-based school counseling programs seek to ensure that all students are served equitably and provide readily available data for assessing program equity and efficacy.

The Next Step: *The ASCA National Model*

With the continued progression of school improvement and standards-based education, the next logical progression was the development of the *ASCA National Model* (ASCA, 2003) to assist the field in delivering comprehensive school counseling programs. The concept of comprehensive programs was not new; first developed by Gysbers and Moore (1981), it has been continuously refined over the past 20 years (Gysbers & Henderson, 2000, 2001, 2002). The *ASCA National Model* (ASCA, 2003) integrated the work of Gysbers and Henderson (2000, 2001, 2002), C. D. Johnson & Johnson (2001), S. K. Johnson & Johnson (2005), and Myrick (2003), and added the content of the *National Standards* (ASCA, 1997) and the process of the *Transforming School Counseling Initiative* (Education Trust, 1999). The *ASCA National Model* has contemporized school counseling foundation and philosophy, management and delivery systems, and accountability, and has aligned the program with the expectations of 21st-century schools (Myrick, 2003).

An organizational structure emerged for the model that consisted of four quadrants: (a) Foundation and Philosophy, (b) Management, (c) Delivery, and (d) Accountability. The inside of the graphic shown in Figure 3.1 depicts the four interrelated quadrants that are the essential components of successful and effective comprehensive school counseling programs (ASCA, 2003). The *ASCA National Model* also facilitates the *new vision* of the transformed school counselor (House & Hayes, 2002; House, Martin, & Ward, 2002). The outside frame of Figure 3.1 represents the skills of leadership, advocacy, collaboration, and systemic change (Education Trust, 1997) needed to help every student succeed academically.

A brief summary of each quadrant follows.

1. The *Foundation* of the program describes the *what* of the program and discusses what every student should know and be able to do (ASCA, 2003, p. 22). The foundation of the program, based on the *National Standards*, highlights the importance of a mission statement and developing a proactive belief system to ensure that every student will benefit from the school counseling program.
2. *Delivery* monitors *how* the program will be implemented and defines the components of the comprehensive program—that is, guidance curriculum, individual planning with students, responsive services, and system support. The *ASCA National Model* details each of the components and offers examples and tools for implementation.
3. *Management* addresses the *when*, the *why*, and on what authority the program is delivered (ASCA, 2003, p. 22). This section also presents the organizational processes and tools needed to deliver a comprehensive school counseling program. The model presents sample agreements of responsibility, data application, and action plans. Time and task analysis tools are also presented.
4. *Accountability* answers the question: "How are students different as a result of the school counseling program?" The *ASCA National Model* encourages school counselors to demonstrate accountability by presenting the effectiveness of their work in measurable terms such as impact over time, performance evaluation, and undertaking a program audit.

Exploring Each Quadrant

The Foundation

The foundation of the program calls for school counselors to develop a proactive belief system that ensures that every student will benefit from the school counseling program. The vision and mission statements guide the development of an effective comprehensive school

Figure 3.1 The ASCA National model.

counseling program while the *National Standards* and student competencies guide and support student development in academic, career, and personal/social domains. The foundation provides the basis for every student to benefit from a comprehensive school counseling program and serves as the solid ground upon which the rest of the program is built. Beliefs and philosophy are inextricably related to behaviors. What school counselors believe about students, families, colleagues, and community can strongly influence their approach to their work. The foundation addresses the *what* of the program, the content and beliefs about what every student should know and be able to do (ASCA, 2003, p. 22).

The Mission Statement The mission describes the purpose for the school counseling program, is aligned with the school's mission, and publicly commits the counselor's intent to provide every student with the skills needed to become lifelong learners and productive members of society. The mission statement promotes collaboration with colleagues to ensure that every student fully benefits from the educational opportunities offered in each school system. School counselors are reminded to align their work with their school's mission statement, which is a public proclamation about student success.

The ASCA National Standards: A Key Component of the Foundation The *ASCA National Standards* and competencies are an integral component of the *ASCA National Model*. The student competencies define the knowledge, attitudes, or skills students should obtain or demonstrate as a result of participating in a school counseling program. They clarify the relationship of school counseling to the educational system and they address the contributions of school counseling to student success. The foundation of the program, based on the *National Standards*, emphasizes the importance of having a mission, a vision, and a proactive belief system that ensures that every student will benefit from the school counseling program (ASCA, 2003).

The *National Standards* place student competencies first, move school counselors into the educational mainstream, and align school counseling programs with the academic disciplines (Dahir et al., 1998). The *National Standards* provide consistency in the description of school counseling programs and the services they provide. They are also a basis for assessing program quality. The information gained from the evaluation process tells what students have learned as a result of participating in a national-standards-based program. Measurable success demonstrates the effectiveness of a school counseling program. Collecting data, gathering information, and conducting research are critical to determine the success of a school counseling program. This empirical information provides the evidence to deliver a defined and accountable comprehensive program designed to help students be successful in school and in life.

The Delivery System

The delivery quadrant offers the methods for delivering an effective school counseling program. The scope of the program may differ across grade levels, thus the variation of delivery methodology is adjusted to meet developmental needs. For example, in elementary schools, the guidance curricula and group guidance activities are utilized more frequently than they are at the secondary level. Gysbers and Henderson (2000, 2002) offered a model for distributing the time allotment of each delivery component across grade levels. The challenge lies in the school counselor's ability to deliver a program that is balanced and blends the four delivery methods: (a) school counseling curriculum, (b) individual student planning, (c) responsive services, and (d) system support.

By carefully examining current practice and student needs revealed by school improvement data, school counselors can determine the amount of time they need to spend on each of the key areas:

1. school counseling curriculum (e.g., structured groups, classroom guidance, advisory programs);
2. individual planning with students (e.g., advising, assessment, placement, academic, career and personal/social goal setting, and follow up);
3. responsive services (e.g., individual and group counseling, consultation, and referral); and,
4. system support (e.g., program management, coordination of services, community outreach, and public relations).

Each of these delivery components has a significant purpose in the comprehensive school counseling program.

School Counseling Curriculum The school counseling curriculum is a sequential, standards-based instructional program designed to assist *all* students acquire, develop, and demonstrate competence in three content area domains: (a) academic, (b) career, and (c) personal/social development. The involvement of school faculty and administration is essential for effective and successful curriculum implementation. In most circumstances, the curriculum is intended to serve the largest number of students possible, and this is accomplished through large group meetings and classroom presentations. The curriculum gives attention to particular issues or areas of concern

in the school building or district, such as eliminating bullying, resolving conflict, or raising aspirations.

Curriculum design requires building a scope and sequence, which helps to define and clarify the topics and competencies taught at each grade level and articulates what students should *know, understand,* and be able to *do* as a result of the curriculum. The curriculum can be delivered through classroom instruction in which *school* counselors design, teach, and assess the impact of standards-based lessons and presentations that meet the academic, career, and personal/social developmental needs of each student. It can also be delivered through *large group instructional activities and presentations* that convey information in a variety of ways by offering group activities, workshops, assemblies, and meetings to accommodate student needs and interests.

Individual Planning With Students Successful students learn to take ownership for their academic, career, and personal/social development. Individual student planning provides opportunities for students to plan, monitor, and evaluate their progress. Activities can include but are not limited to working with students to establish and monitor goals, develop a career plan, commit to behavioral goals, create an educational plan, and apply testing and assessment information to present and future plans. The planning process personalizes the educational experience and helps students develop a pathway to realize their dreams.

Individual student planning consists of ongoing, systematic activities that assist students with planning, managing, and monitoring their academic, personal/social, and career and employability goals. These activities are counselor directed and delivered on an individual or small-group basis. Each student is provided with the information, encouragement, and support needed to work toward his or her personal goals. Parents and/or guardians are frequently included in these activities.

Responsive Services When school counselors proactively address student-related concerns such as peer pressure, conflict resolution, family relationships, personal-identity issues, substance abuse, motivation, and achievement challenges, they deliver responsive services. Included in responsive services are interventions necessary to help students succeed, which include individual and group counseling, consultation, referrals to community agencies, crisis intervention and management, and prevention activities. The impetus for response and intervention can be dominated by crisis, school building and faculty concerns, parental trepidations, community concerns, and student requests. Responsive services can also proactively address concerns and prevent situations from occurring. Implementation strategies can include the following:

1. *Individual or small group counseling:* Counselors counsel students with identified needs/concerns or students who request counseling. This is an opportunity to discuss/clarify needs and guide therapeutic intervention. The school counselor must act ethically at all times in accordance with the ASCA Ethical Standards (ASCA, 2004) and with federal, state, and local laws and policies regarding confidentiality, suspected cases of abuse, and threats of harm or violence.
2. *Consultation:* Counselors work collaboratively with students, parents, teachers, and community members to develop a broad base of support and help for students.
3. *Referrals:* Counselors consult with and make referrals to community agencies to assist students facing personal crisis outside the scope of the school counseling program.
4. *Crisis counseling:* Counselors provide short-term prevention and intervention counseling and support to students and school staff dealing with crises.
5. *Crisis prevention* and *crisis management plans*: Specialized plans guide school prevention, intervention, and management of crisis response. Staff crisis training establishes readiness to meet student/school needs in emergency situations.
6. *Schoolwide prevention and intervention programs:* Counselors collaborate with all faculty, students, staff, and community-based organizations to expand responsive service outreach.
7. *Student support services team:* Counselors collaborate with school-based professionals such as the school psychologist or social worker to plan interventions for the academic, social, and emotional needs of students.

System Support School counselors, when engaged in system support, offer ongoing sustenance to the school environment by actively participating in school-based activities when delivering the comprehensive school counseling program. Involvement in system support sends a strong message to the faculty that the school counselors are committed to achieve the system's goals and mission. System support demonstrates the degree to which the school counseling program is aligned with the school district's priorities and with state and federal school improvement mandates.

System support usually consists of indirect services, which are not delivered directly to students. For example, chairing the school improvement team, coordinating student service volunteers, and facilitating the school peer mediation program are examples of proactive services that connect school counseling to the mission of the school. System support also provides school counselors with multiple opportunities to act

as leaders and advocates by facilitating discussions around school improvement, examining data that may be impacting success of some groups of students, and assisting with professional development and in-service activities for the faculty. Indirect services including professional development to faculty, serving on school committees, coordinating safe school initiatives are essential to impact systemic change and support the "new vision" of transformed school counseling (Ripley, Erford, & Dahir, 2002).

The Management System

Effective programs require strong organization and effective management. The management component of the ASCA model addresses the *when* (action plan and calendar), the *why* (use of data), the *who* will implement (management agreement), and on what authority (management agreement and advisory council) the school counseling program is delivered. The *ASCA National Model* suggests the following key elements to manage the program.

Developing Management Agreements Management agreements are established annually between school counselors and the building administrator. The counselor(s) produce and present yearly a document that prioritizes school counseling, timelines, and the implementation plan. The principal then reviews the document and arrives at consensus with the school counselor as to how students, services, and activities are assigned. These decisions should be made based on site needs and data analysis. The agreement delineates counselor responsibilities, program implementation, and methods of accountability, and it offers a timeline for when these activities will occur.

When the principal and school counselors meet and agree on program priorities, implementation strategies, and the organization of the counseling department, the entire program runs more smoothly and is more likely to produce the desired results for students. Thus, the management agreement is a public statement to all stakeholders, and it demonstrates the commitment of school counselors and administrators to collaborate on an annual statement describing what the counselors hope to accomplish in the coming year.

Advisory Council An advisory council helps to solicit school and community support to inform the program's direction, to provide a sounding board for discussion about what is working and what needs to change, and to discuss the ways in which the comprehensive school counseling program can better support student success. An advisory council assists in the development of the school counseling program by annually reviewing program goals and results, and making recommendations for improvement. It provides a forum for open dialogue between schools and community and the perspective of community and parental expectations for the counseling program.

Council membership should reflect the community's diversity and can include school staff, parents, school board members, and student, business, and community representatives. Members selected must share an interest and enthusiasm for the school counseling program and representation could consider including the following stakeholders:

- Teachers
- Parents
- School counselors
- Administrators
- Community members (nonparent)
- Business/industry/labor leaders
- School board members
- Student(s)
- College (2- and 4-year) representatives
- Community-based organizations
- Counselor educators

Use of Data Monitoring student achievement data helps to ensure that all students have equity and access to a rigorous academic curriculum and identifies academic gaps. Counselors suggest systemic changes in policy and procedures to improve student performance. The use of data to effect change within the school system is integral to ensuring students' success. School counselors should be proficient in the collection, analysis, and interpretation of data, and they should monitor student progress through collection of three types of data:

1. Student achievement data, which can include standardized test scores, GPA, graduation rate, promotion/retention rates, and so forth;
2. School improvement data, which can include course enrollment patterns, discipline referrals, suspension rates, attendance rates, parent/guardian involvement, participation in extracurricular activities, and so forth; and
3. Student competency data, which can include percentage of students with a 4-year plan, percentage of students participating in job shadowing, and percentage of students achieving the competencies as determined by the faculty.

Action Plans Planning is necessary to detail annual program activities which show how the desired results will be achieved. Action plans usually contain

- Domain areas, national standards, and school improvement goals;
- Student competencies and descriptions of the activity;

- Curriculum/materials being used in the activity;
- Time lines;
- Methods of evaluation;
- Measurable outcomes;
- Person(s)responsible; and
- A description of the students involved.

Program Audit/Self-Study

An annual program audit or a self-study helps to determine the degree to which the school counseling program is being implemented and is in alignment with the ASCA model. Audit results provide information on the current state of the school counseling program, identify gaps and/or implementation challenges, and help the counselors plan for the following school year.

Use of Time Gysbers and Henderson (2000) offered specific recommendation for time distribution and suggested that school counselors spend 80% of their time in direct service to students and 20% of their time in indirect services and program management. While the amount of time counselors should spend delivering services in each component area may vary according to the individualized needs of each school, the ASCA has provided the recommendations shown in Table 3.3.

Calendars Calendars (district, departmental, and individual) are integral to maintaining a comprehensive counseling program because of the specificity in terms activities, actions, and events. An annual district calendar articulates the delivery of the various elements that comprise the program. Developed by the leaders of the district's school counseling program, the calendar allocates time for curriculum development, individual student planning, responsive and intervention services, and system support. When a calendar is developed and published, teachers, administrators, students, and families are aware of the scope and extensiveness of the activities of the school counseling program.

An annual school counseling department calendar follows the district calendar. The school counseling departments in each of the district's elementary, middle, and high schools construct calendars that align with the building calendar. This calendar is set up by month and by grade levels for the entire year for each school. Counselors list activities or themes to be delivered and specify how collaboration with school, district, family, and community stakeholders will occur. Yearly calendars also include quarterly grade reporting dates, state assessments, college entrance exams, orientation, graduation, as well as ongoing activities such as respect days, wellness days, career fairs, college expos, and other special events for students and their families.

Calendars ensure involvement. When stakeholders are aware of activities and services, the probability of becoming involved or participating increases. Calendars are also significant public relations tools and are public statements of the variety of services and activities offered both during the school day and in extended hours and/or weekends.

The management quadrant reminds us of the importance of organization and building a cadre of support for comprehensive school counseling. Although the program is coordinated by school counselors, many activities are shared by the entire staff and require a collaborative approach. These can include

- Planning and organizing tasks,
- Action plans around specific school issues,
- Organizing activities with teachers about program operation, and
- Publicizing activities and events.

The Accountability Quadrant

Accountability provides evidence of program accomplishments or student gains as a result of intentional efforts by the school counselors (Hart & Jacobi, 1992). School counselor accountability intentionally contributes to closing the achievement gap and meets the goals of school improvement.

Table 3.3 Sample Distribution of Total School Counselor Time Within the Delivery System Component*

Delivery System Component	Elementary School % of Time	Middle School % of Time	High School % of Time
Guidance Curriculum	35–45	25–35	15–25
Individual Student Planning	5–10	15–25	25–35
Responsive Services	30–40	30–40	25–35
System Support	10–15	10–15	15–20

* Adapted from Gysbers, N.C., & Henderson, P. (Eds.). (2000). *Developing and managing your school guidance program* (3rd ed.), Alexandria, VA: American Counseling Association.

School counselors are sometimes challenged to demonstrate the effectiveness of the school counseling program in measurable terms. The *ASCA National Model* (ASCA, 2003) encourages school counselors to collect and analyze data, use data-driven decision making, use evaluation methods that focus on student achievement, and contribute to the school and system improvement goals. By using their specialized training in group process, collaboration and teaming, and data analysis, school counselors demonstrate how the school counseling program moves school improvement data in a positive direction.

Using Data Data present the picture of the status of student needs and achievement issues and corroborate the development of practices that can lead students to higher levels of success. Data inform, confirm progress, and reveal shortcomings in student performance (Stone & Dahir, 2007). Annual school report cards publicize critical data elements such as attendance, demographics, graduation and postsecondary planning rates, and standardized testing results. These can be monitored and analyzed longitudinally and show how the work of school counselors impacts student achievement.

MEASURE-ing Success

MEASURE, a six-step accountability process, confirms the impact of the school counseling program on critical data, those elements of the school report card that are the backbone of the accountability movement. MEASURE supports the accountability component of the ASCA *National Model* (ASCA, 2003) and moves school counselors from a "counting tasks" system to aligning the school counseling program with standards-based reform (Stone & Dahir, 2007). MEASURE is a way of using information such as retention rates, test scores, and postsecondary going rates to develop specific strategies for connecting school counseling to the accountability agenda of today's schools. MEASURE is an acronym to help school counselors remember the following:

- *Mission:* Connect your program to the mission of your school and to the goals of your annual school improvement plan.
- *Elements:* Identify the critical data elements that are important to the internal and external stakeholders.
- *Analyze:* Carefully discuss which elements need to be aggregated or disaggregated and why.
- *Stakeholders-Unite:* Invite stakeholders to collaborate and address this school improvement issue and unite to develop strategies.
- *Results:* Reflect on your results; rethink and refine your strategies; refocus your efforts as needed.
- *Educate:* Show the positive impact the school counseling program has on student achievement and on the goals of your school's improvement plan.

MEASURE is a model of teaming and collaboration. It requires school counselors to work side by side with administrators, faculty, and stakeholders to identify and positively impact the critical data elements that are important barometers of student success (Dahir & Stone, 2003). MEASURE supports the accountability component of the ASCA *National Model* (ASCA, 2003) by helping school counselors move from a "counting tasks" system to aligning the school counseling program with standards-based reform. This process enables school counselors to demonstrate how they are accountable for results and contribute to student achievement.

Putting Theory Into Practice

During the 2004–2005 school year, a pilot project in New York City demonstrated that school counselors can use data to act on their belief system and assume a leadership role to identify and rectify issues that impact every student's ability to achieve at expected levels. The school counselors in three schools in Region 4 in Queens, New York, used MEASURE to initiate, develop, lead, and coordinate systems to improve the learning success for every student. The school counselors, working from an accountability perspective, contributed to key school improvement data and brought attention to student progress and results.

The school counselors identified a specific school improvement goal and analyzed the data that represented the issues surrounding that goal. As the school counselors aligned their services and activities to the issue, they shared accountability for student success with the administrators, faculty, staff, and students and contributed to the expectations of *No Child Left Behind* (USDE, 2001) and the accountability quadrant of the ASCA (2003) and New York State Models (New York State School Counselor Association, 2005). The baseline data was identified and disaggregated demographically. The results of three of the pilot school's projects are included in Table 3.4.

School counselors, working within an accountability framework, can challenge the pervasive belief that socioeconomic status and color determine a young person's ability to learn. Acting as agents of school and community change, school counselors can create a climate where access and support for quality and rigor is the norm (Lapan, 2005; Stone & Dahir, 2007). In doing so, underserved and underrepresented students now have a chance at acquiring the education skills necessary to fully participate in the 21st-century economy (S. Johnson, C. Johnson, & Downs, 2006; Stone & Martin, 2004). The *No Child Left Behind Act* (USDE, 2001) is a clear imperative for school counselors to accept the responsibility to support academic achievement, share the pressures of school accountability, and demonstrate advocacy for every student to experience success

Table 3.4 New York City School Counselor Accountability Project 2004–2005

School Site	Location	Student Population	School Improvement Data	Results
PS 229 Emanuel Kaplan Elementary School	Woodside	Caucasian/Non-Hispanic: 30.6% African American: 3.1% Hispanic: 38.7% Asian: 27.6% Free/Reduced lunch: 43.5% ESL: 19.0%	Increase the 4th grade English Language Arts test scores	Increased the number of students from level 2 (below standards) to level 3 (meets standards) by 8%
Long Island City High School 4100 students	Long Island City	Caucasian/Non-Hispanic: 15.9% African American: 15% Hispanic: 51.4% Asian: 17.7% Free/Reduced Lunch: 60.3% ESL: 15%	Improve the number of students achieving Regents diplomas	Increased the number of students achieving Regents diplomas by 5%
Newtown High School 4290 students	Elmhurst	Caucasian/Non-Hispanic: 8% African American: 6% Hispanic: 60% Asian: 26% Free/Reduced Lunch: 27% ESL: 40%	Improve attendance	Increase of 2% in average daily attendance

(Brigman & Campbell, 2003; Dahir & Stone, 2003; Gysbers, 2005; Stone & Dahir, 2006, 2007). With an accountable, data-driven school counseling program, school counselors are seen as powerful partners and collaborators in school improvement and most importantly, as proactively driving their own destiny (S. Johnson et al., 2006; Stone & Dahir, 2007).

Can school counseling continue to evolve with the times and openly examine paradigms and practices that forward the profession? The profession of school counseling has evolved in a very short period of time from a service driven approach to a systemic and programmatic model. *The National Standards* (ASCA, 1997), *Transforming School Counseling Initiative* (Education Trust, 1997), and the *ASCA National Model* (2005) have enabled school counselors to seize the present and forge a path to the future. School counselors now have a well designed approach to design, coordinate, implement, manage, deliver, and evaluate their programs. Leadership, advocacy, and systemic change are essential skills that ensure that school counselors can respond to the question, "How are students different as a result of what we do?"

No matter how comfortable the status quo or how difficult or uncomfortable change may be, every school counselor must work diligently to support every student's quest for success. The *ASCA National Model* (ASCA, 2003) has directed school counselors toward a unified, focused, and professional school counseling program with one vision and one voice.

IV
STUDENT ACCOMPLISHMENT: Equity and the School Counselor's Role

HARDIN L. K. COLEMAN
School of Education
University of Wisconsin–Madison

Introduction

Rarely does a child become accomplished on his or her own. For most of us, it takes a range of familial, school, and community support to be successful. Children from middle-class families are born with this support. Middle- and upper-class families are structured to prepare their children for school, to be available to the school for communication about the child, and to provide for the child those experiences (e.g., sports, music lessons, or sit down family dinners) that teach the social skills of school (e.g., delaying gratification, paying attention, deference to authority, and performance under pressure). The lower a family's economic status the more difficult it is to provide this support. As Wilson (1997) demonstrated, in low-income environments, particularly in urban areas where work is not available, children have fewer opportunities to see the behaviors that translate into school success. When adults are denied work opportunities, children are denied the opportunity to learn the social skills that lead to the work habits of a mainstream occupation.

It has always been the role of school to take children from their families to train them in the skills, knowledge, and attitudes that are necessary to be effective members of the community. In effect, schools have always been agents of enculturation. Within an increasingly diverse society, there are mounting challenges to this process of enculturation and challenges as to whether this should be the role of the school. Unfortunately, even as the role of the school to train children and parents in the social skills that lead to school success becomes more challenging, schools are cutting back on the staff members who are prepared to provide those trainings (e.g., school counselors and social workers) and emphasizing academic skill development in preparation for high-stakes tests. To succeed in this context, low-income and culturally diverse children need to develop personal skills and acquire social support systems that allow them to overcome the challenges to their success. In short, they need to be resilient. In our increasingly complex society, all children are coming to school with fewer social supports than they had a generation ago. With increased mobility, increased divorced rates, changing social roles, increasing disparities in wealth, and rapidly changing occupational choices, the demand for children to have the social competence to negotiate school has increased.

The central thesis of this chapter is that addressing this development of social competence should be the organizing principle for the school counselor who is committed to student accomplishment. As one reviews local, state, and competing national models of school counseling, it is apparent that a range of choices is provided for school counselors. Are they to focus on their role as consultant and systems change agent through a focus on data driven programming as promoted by the Transforming School Counseling Initiative (Education Trust, 1999)? Are they to focus on the tasks assigned by the principal as a function of the demands within the school or grade level? Are they to focus on developmental guidance, post-high-school planning, preventive services, parent involvement, truancy, bullying, or testing? These multiple responsibilities, obligations, and ranges of choices create tremendous variability in the manner in which school counseling programs are organized around the country and within districts. Some are organized around a model (e.g., the American School Counselor Association's [ASCA] model and the Transforming School Counseling Initiative [TSCI], as well as those of states or districts). Others are organized around certain types of programming, whether that is career focused or personal growth. Some are organized around the demands

of a particular group (e.g., college applications in high-performance districts) or the demands of a context or principle (e.g., preparation for high-stakes testing). Still other programs are organized around the skills or predilections of the school counselor in the building. These confusions and variabilities challenge our ability to create a meaningful and accepted role for school counseling throughout PK–12 education. This challenge is part of what has driven the development of the *National Model* by ASCA and the TSCI by the Education Trust.

In this chapter, I will use what we know about minority student achievement to demonstrate the need to organize our thinking about school counseling around student outcomes. Minority students around the country are at risk for underperformance and failure in American public schools. It is my contention that many of the factors that put minority students' at risk are also factors that challenge the academic progress of all students. It is, therefore, important that the characteristics a student needs in order to overcome this risk status are—or should be—the focus of a systematic and developmental school counseling program. In this chapter, I will provide the justification for an outcome-oriented school counseling program around which the roles and tasks of a school counselor can be organized as appropriate to the particular needs of the context in which the program is being implemented.

To make this argument, I will present the various choices for organization that are available for school counselors. I will then present a process model for understanding student achievement that I will use to contextualize these choices. Using minority student achievement as the case example, I will propose a student outcome-oriented framework for implementing a systematic and developmental school counseling program. Prior to presenting this information, I want to define what I mean by the terms *accomplishment, achievement*, and *success*.

Although I will use these phrases interchangeably throughout the chapter, the important variable for me is accomplishment, which from my perspective includes achievement and is a predecessor of success. In the current conversations about schools, there is a huge focus on achievement, particularly as measured by academic performance. The minority student achievement gap is measured in the difference between groups on standardized academic tests such as the SAT or ACT. The effectiveness of a school and district is often measured by the percentage of children who go on to highly competitive colleges, which increasingly use grade point averages, challenging core academic courses, and standardized scores as their criteria for admissions. Obviously, academic proficiency is one measure of accomplishment; however, I think it is important that we consistently articulate that is it not the only useful measure.

Not every student is well served in a college preparatory curriculum. Not every student who participates in such a curriculum should be measured by his or her success in those subjects. The student who has significant accomplishments in the arts (instrumental, choral, or theatric) needs to be understood as having achieved success. The student who effectively organizes a service-learning experience, volunteers to work with the elderly, holds down a job, develops technical skills, comes to school every day, and makes it through classes in which he or she is not performing at a high level needs to be understood as accomplished and competent. When a school begins to focus on celebrating the many ways in which a student can be accomplished, they begin to create a culture in which many students can develop a sense of belonging and feel motivated to find a productive role as a citizen in a pluralistic society. From my perspective, this is the most important measure of success (see Lindwall & Coleman, chapter 24, this volume, for an in-depth discussion of the importance of creating a caring school community). As will be made clear in this chapter, I am advocating that school counselors take a leadership role in helping their students, colleagues, principals, parents, and communities to understand and act on the importance of focusing on what each child brings to the situation and what each child can gain from school, rather than applying an oppressive and outdated single model for success in school.

For me, therefore, accomplishment is developing the awareness, knowledge, and skills to become an effective citizen in a pluralistic society. What this accomplishment looks like will be incredibly diverse.

Organizational Choices

Since the history of school counseling and the development of the National Standards for School Counseling Programs are covered in other chapters, I will not repeat those discussions here. In this section, I will use this information to highlight the choices in models that school counselors have for developing a school counseling program. I will briefly outline the model promoted by the ASCA (2003), the *Transforming School Counseling Initiative* (Education Trust, 1999), and several other relevant models before proposing an integrative model.

The ASCA *National Model* is becoming the standard for organizing school counseling programs. The focus of this model is the acceptance of three standards for judging student outcomes from an effective school counseling program: (a) academic development (b) career development, and (c) personal/social development. The strength of this model is that it moves us away from the discussion about school counselors' skills to the outcomes we want for our students. The limitation of this model is its lack of

specificity in either the behavioral representations of these outcomes, the school counselor's role in producing these outcomes, or how these outcomes will be assessed. Core to the standards movement in education (ASCA, 2003) is the proposition that the standards can be mastered and assessed. As the *National Standards* are more fully integrated into national practice, these limitations must be addressed in a systematic manner.

The TSCI, stimulated by the Education Trust (1999), is an alternate model upon which a school counseling program can be developed. In some ways, this model addresses one of the limitations of the ASCA model: A core principle of the TSCI is that programs should be data driven. One focus of this model is that a school counselor needs to be able to identify the data that supports his or her efforts in a particular area. The TSCI is deeply invested in the focus on helping students succeed in rigorous academic programs, with a particular interest in ensuring equitable access to these programs for culturally diverse students and changing the school systems to ensure the existence of a rigorous program and equity. The strengths of this model include the focus on equity, the use of data to inform practice, and the importance of system change. One central limitation to this model is that it accepts the notion—which does not have empirical support—that everyone can succeed in an academically focused program, and it seeks to judge the effectiveness of a school counseling program on this goal. As important as it is for school counselors to be sophisticated in their understanding of systems issues and participate in school reform, turning their focus away from a mental health and student-centered approach to an administrative-consultative focus may leave a broad group of students underserved.

One important issue to address here is the difference between academic achievement and accomplishment. The former assumes that the goal of school is to make sure that every student performs at a high level of achievement in his or her classes. This assumption facilitates the refocusing of a curriculum around the acquisition of content in core classes rather than the development of the whole person or addressing the needs of a diverse student population for which a college preparatory curriculum may not be universally appropriate. Such a school may not facilitate the type of connection and growth that will allow a student to explore her or his interpersonal self, artistic self, or mechanical self. A school that focuses on helping students to feel accomplished would be one that provides offerings to meet the diverse needs of students, including the academically talented, the artistically gifted, and the rest who are seeking to find a satisfying occupational role that may not be predicted by performance on an academically oriented test.

Process Model of Minority Student Achievement

Applying this conceptualization to minority student achievement means we need to focus on the conditions that contribute to minority student performance and the conditions of risk, and then identify situations when minority students overcome the high probability of failure. This process perspective views academic performance as an outcome. It is not random, and it is not purely a function of individual or group characteristics. Academic performance is predicted by a set of factors that, when manipulated, will produce different outcomes. The major reason to study this process model is to enhance our ability to effectively manipulate those factors in order to produce desirable outcomes. As Coleman (2007) has suggested, in this conceptualization (see Figure 4.1), three major categories of factors interact to predict minority student achievement: social stratification (e.g., class), contextual factors (e.g., parental involvement), and personal factors (e.g., social competence).

Social Stratification. The first category involves those factors that lead to social stratification within most societies, particularly those dominated by a capitalist economy (Bordieu, 1986). These factors are associated with the groups into which a person is born, which have, over time, regulated those group members to a particular status within a certain society that is reinforced by the values and practices of that society.

Social class. Within the United States, the reality of this process is readily apparent in educational outcomes. Performance, as measured by standardized tests, is predicted by a combination of social class status, with the poor underperforming the wealthy; racial/ethnic status, with those from historically disadvantaged groups—particularly students who have African, Latin, or Native American backgrounds—underperforming their European-descended peers; and gender, with girls historically underperforming boys, although this relationship is changing as a function of increased attention and change to policies and practices that have historically disadvantaged girls (Konstantinos & Wladina, 2003; Thernstrom & Thernstrom, 2003). Within the context of this paper, it is apparent that socioeconomic status can protect a child or put a child at risk. It is not poverty per se, however, that predicts academic performance, but the conditions of poverty that constrain the acquisition of the awareness, knowledge, and skills that lead to success in schools.

Gender. Gender is the next social stratification factor that has, historically, predicted academic performance. In many ways, this is an encouraging factor to acknowledge,

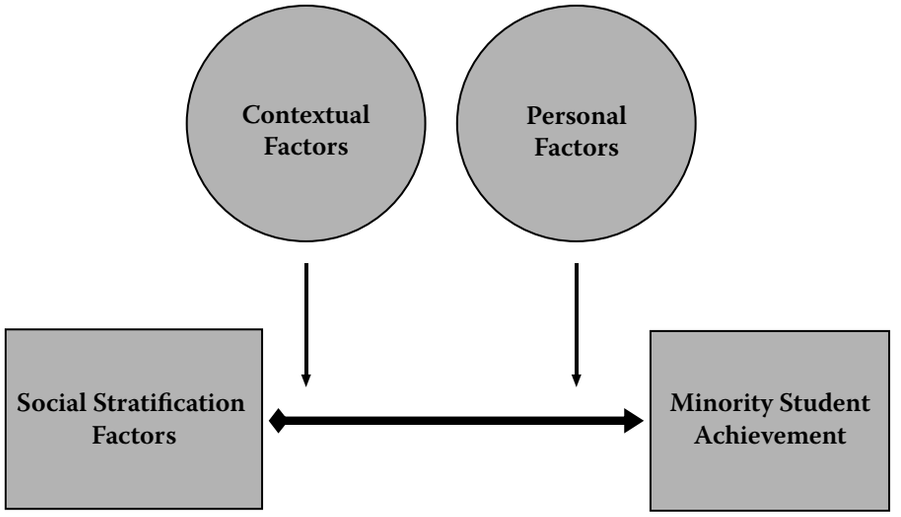

Figure 4.1 Process model of minority student achievement.

because with the changes in values, policies, and practices, the manner in which gender influences performance is changing. As Bleuer and Walz (2002) have found in an examination of national data, the gap between boys' and girls' academic performances is significantly reduced. This gives hope to the belief that the effects of these social stratification factors are malleable. In many ways, the manner in which gender influences academic performance is similar to the manner in which poverty has an impact, but it is also more complex.

Discrimination. Historical policies and practices of discrimination are the third social stratification factor that influences academic performance. How we, as a society, provide financial resources to schools is deeply reflective of our belief in replicating class structure. Allowing schools to be financed by the wealth of the community in which they reside also allows for this replication. A high-poverty area will not have the resources to meet its members' needs, while these resources may be available to a school in a wealthy community. Historical practices of racial discrimination in times of economic well-being (e.g., separate and unequal schools during the post-World-War-II boom) make it more difficult for members of those discriminated groups to take advantage of economic opportunities. They are more likely to be in poverty areas, which are more likely to have inadequate schools. Furthermore, those schools are less likely to send students to a quality postsecondary educational institution, which serves to keep the economic opportunities constrained. As such, a group stays within the lower reaches of the economic structure that reinforces an internal sense of possibility and the external ascriptions of competence. This process serves to maintain current forms of stratification. Changing this, therefore, requires extraordinary efforts at the individual, institutional, and societal levels.

Contextual Factors. Contextual factors interact with social stratification factors to influence minority student achievement. According to Brofenbrenner (1979), individuals develop within a complex weave of distal and proximal variables. He called those distal factors the "macrosystem," which involves a society's history, political, and economic structure (constitutions, federal government, religious traditions, or national media), and "exosystem," which includes the more immediate expressions of the macrosystem that have a direct impact on the functioning of a particular ecological niche (e.g., local government, school board, or employers). These elements influence the nature of the social stratification factors just described. More immediate to the development of a child is what Brofenbrenner called the "mesosystem," which encompasses the institutions and relationships that directly enculturated the child into the values and desired behaviors of their macrosystem. Four major elements historically make up a child's mesosystem: their (a) school, (b) family, (c) peers, and (d) institutions such as a church or similar community organization. These contextual factors influence minority student achievement. The stronger and more stable these factors are, the more likely it is that the student will overcome the social stratification factors that may predict his or her academic failure. Unfortunately, the higher the risk factors within the child's macrosystem, the more likely their mesosystem or context will negatively influence their school performance. Growing evidence suggests three contextual factors that have a direct influence on minority student achievement:

(a) parental involvement, (b) school and teacher quality, and (c) a caring and committed community, both within and outside of the school (Borman, Hewes, Overman, & Brown, 2003).

Parental involvement. There is evidence (Spera, 2005) that the more a parent attends to his or her child's academic progress, the better that child will do in school. This finding holds true across class, gender, and cultural lines (Bogenschneider, 1997; Jeynes, 2003). In order to be effectively involved in a child's schooling, the parent must (a) know where his or her child is on a regular basis, (b) provide the child with the space and materials he or she needs to do schoolwork, and (c) provide the structure and experiences that teachers expect a child to have prior to coming into the classroom. This often involves having the skills to effectively interact with school personnel to advocate for the needs of this child. As is readily apparent, having the resources to provide this attention will be a factor of the parent's class status. The more financial resources a parent has at his or her disposal, the better able the parent is to provide the stability and structure that correlates with good academic performance. The more a parent understands the culture of the school, the better able parent is to negotiate for the needs of their child. The less parents understand and know about the culture of the school, the more difficult it is to understand what the child needs or how to be his or her advocate. It, therefore, becomes more difficult to be involved. An important focus of an effective school counseling program with a focus on equity will be to develop strategies to increase parental involvement in the school and provide training in parenting techniques that facilitate student accomplishment.

School and teacher quality. Student performance is closely related to the quality of a school in terms of enriched curricular offerings, safety of the school, student/teacher ratio, and extracurricular activities (Borman et al., 2003; Borman & Rachuba, 2001; Griffith, 2003). Student performance is also closely related to the percentage of well-trained and experienced teachers on the staff of a school (Borman et al., 2003). In practice, well-trained and experienced teachers tend to gravitate to high quality schools in which they can spend more time engaged in the academic, rather than the social, development of students. Conversely, as a function of poverty and housing discrimination, minority students are more likely to be in schools that are overcrowded, have high mobility rates for both the students and teachers, and have teachers who are either inexperienced or underprepared to meet the diverse needs of an ethnically diverse school population with a high concentration of poverty. This interaction has a direct impact on constraining the academic performance of minority children.

Caring school and community. There is a growing body of evidence to show that schools that facilitate connections within classrooms (e.g., between faculty and students, and with the community at large) have better academic performance than schools that have not created this type of community (Karcher, 2005; Lindwall & Coleman, chapter 24, this volume). Schools possessing economic resources and cultural continuity between the school and the community in which it resides have an easier time creating an environment in which all children and parents believe they belong in the school and have shared expectations of performance. Unfortunately, too high a percentage of minority students do not attend this type of school, which serves to depress their academic performance in relationship to peers who attend schools with effective caring communities.

Personal Factors. Most sociological and education research has focused on the effect of social stratification and contextual factors on minority student achievement (e.g., Mehana & Reynolds, 2004). This evidence suggests, in a somewhat overwhelming manner, that these factors, external to the individual, are the primary predictors of performance, that to be poor, to be female, and to be an ethnic minority is to be at high risk for academic failure or underperformance. It is vitally important not to make the leap to suggest that this is an essentialist reality (Coleman, Norton, Miranda, & McCubbin, 2003). It is to suggest that the ecological contexts into which many ethnic minorities are socialized do not provide the awareness, knowledge, skills, and social resources necessary for them to be successful in American schools. It is also to suggest that ethnic minorities who are successful in schools have demonstrated resilience, as described earlier in this chapter. Given the probabilities, minorities who perform well in school have overcome significant risk factors and are, therefore, resilient. In order to increase the number of ethnic minorities who are resilient, we need to better understand the factors that contribute to this success.

To build resilience in minority students will require a multivariate approach, Figure 4.2. In order to truly change the process, economic and political strategies need to be employed to increase the economic opportunities of the poor and to eliminate the current effects of gender and racial discrimination. In addition, school reform efforts must successfully provide quality schools and teachers to all children across the country. In the meantime, we need to enhance the capability of individual minority students to overcome adversity in their lives. The first step in this process is to understand and address the personal factors that appear to help these students be resilient. Based on a review of the existing literature, those personal factors that are particularly relevant for minority students seem to

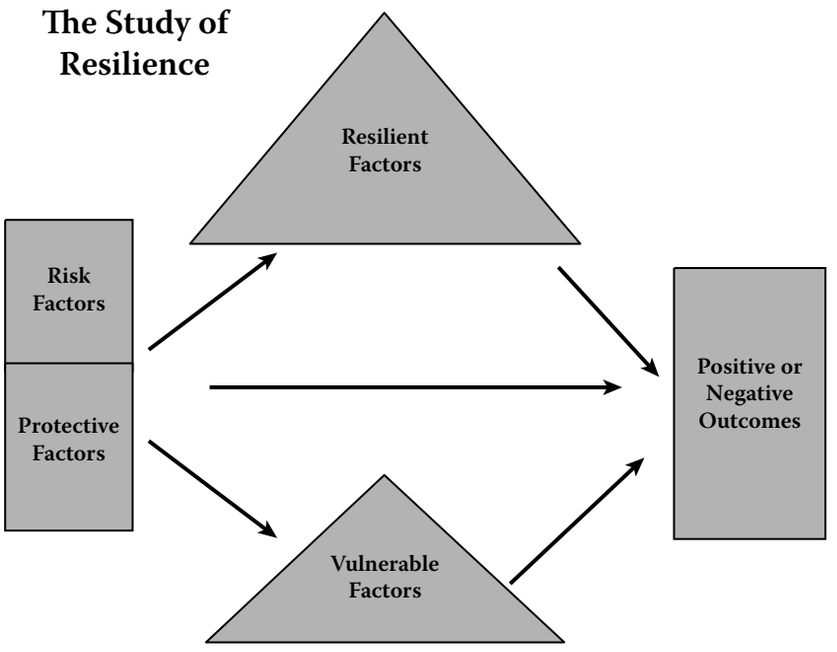

Figure 4.2 A resilience model of minority student achievement.

include intellective competence, social skills, cultural identity, and bicultural competence.

Intellective competence. The National Study Group for the Affirmative Development of Academic Ability (NSGADAA; 2004) has posited the concept of intellective competence rather than intelligence as a more useful way to think and talk about the skills an individual has that translate into academic success. They define intellective competence as

> systematic ways of reasoning, of inferring patterns from one's environment, and using them to maintain practices and to invent new ones; highly adaptive, rich habits of thinking; engagement in meaningful problem solving. Academic intellective competence is a highly specialized set of abilities that should be acquired as the result of particular kinds of experience over long periods of time in Western schooling. (p. 48)

The core thrust of this report is that the ability to perform well in an academic setting is not a function of biological endowment or other natural talent, but that this ability is something that can be acquired within the appropriate context. As stated above, being raised in a wealthy family and attending high-quality schools with high-quality teachers facilitate the acquisition of intellective competence, which leads to quality academic performance. The skills that are involved with intellective competence are presented in Table 4.1.

As the NSGADAA intended, this concept is appealing precisely because it identifies the range of skills, abilities, and dispositions that can be taught and that relate to academic performance. Although the report provides evidence of the validity of these dimensions and describes strategies that can be used in schools to develop these skills, abilities, and dispositions, it does not provide evidence that links the acquisition of these dimensions directly to academic performance. In this political period where the assessment of academic competence is becoming increasingly focused on the acquisition of content and performance on high stakes tests (U.S. Department of Education, 2001), this is a linkage that is important to demonstrate. Although the concept of intellective competence avoids the essentialist traps of intelligence testing as represented by Hernstein and Murray (1996), there is no evidence concerning the distribution of this competence across class, ethnic and racial, or gender groups. More research needs to be committed to this concept in order for us to understand its precise role in minority student achievement.

In theory, intellective competence could be a personal resilient factor. The more of this competence a poor minority student had in a low-quality school, the more likely he or she would be to outperform his or her peers. If this were the case, then strategies to enhance this competence would be a way to improve minority student achievement, which is the focus of the NSGADAA (2004) report. What is lacking is a reliable and valid measurement of this competence. McDermott (1999) has developed an approach to measuring intellective competence, but there are no stud-

Table 4.1 Skills, Abilities, and Dispositions of Intellective Competence (NSGADAA, 2004).

Skills	Abilities and Dispositions
Literacy and numeracy	Perceive critically
Mathematical and verbal reasoning	Explore widely
Creating, recognizing, and resolving relationships	Bring rational order to chaos
Problem solving from both abstract and concrete situations, as in deductive and inductive reasoning	Bring knowledge and techniques to bear on problem
Sensitivity to multiple contexts and perspectives	Test ideas against explicit and implicit assumptions
Skill in accessing and managing disparate bodies and chunks of information	Value and use empirical data
Resource recognition and utilization	Recognize and create relationships between concrete and abstract phenomena
Self regulation	Channel ideas and energy into productive and pro-social activity

ies to demonstrate its external validity. In lieu of such a measurement, attempts to measure the role of academic ability as a resilience factor need to be cautious about using measures that are culturally biased and dependent on the cultural competence of the assessor (Dana, 1996).

Social skills. In the literature related to resilience, there is an ongoing conversation about several elements in need of greater specification. In particular, literature that addresses risk and protective factors (e.g., Bogenschneider, 1996) or developmental assets (Search Institute, 2005) has a tendency to combine different levels of analysis. In terms of the framework in this chapter, they combine the social, contextual, and personal factors into the same level. In conversations about risk and protective factors or developmental assets, it is hypothesized that the sheer number of factors or assets predicts outcome without specifying which ones contribute more or in which way to outcome. One need in this area of research is to specify these relationships.

There are multiple ways in which scholars have discussed the manner in which social skills or social competence has a significant influence on the quality of outcomes in a child or adolescent's life. The core hypothesis in much of this literature is that the better a child's social skills, the more effectively he or she will be able to negotiate an ecological niche and reach developmental milestones. In many cases, social skills are seen as playing a central role in a child's emotional health and well-being, which also translates into positive academic performance (e.g., Parke & Welsh, 1998). The assumption in this chapter is that a social skill, applied in a situation of risk, is an individual resilience factor. One of the confusions in the resilience literature is the implication that these skills are somehow different than social skills are. An analysis of some of the theories concerning individual resilient and protective factors shows that social skills are protective factors that contribute to individual resilience.

This construction of resilience is powerful in its appeal about the character of children who are able to overcome conditions of risk. The conflation of attitudes and behaviors within each attribute makes it difficult to use it to guide scholarship in this area or to guide interventions (see Coleman et al., 2003, for an attempt to build such an intervention based on this model). Prior to using this model to guide a study of the relationship between personal factors of resilience and resilient outcomes, clarity needs to be drawn between which part of the relationship is a function of attitudes and which part is a function of skills or abilities. This important distinction should be consistently applied in the investigation of resilience.

Goleman (1995) has done an excellent job of describing the concept of emotional intelligence and how it can be considered a personal characteristic that, when used in situations of risk, could produce a resilient outcome. Table 4.2 is a summary of what he has identified as the characteristics of emotional intelligence: (a) emotional self-awareness, (b) managing emotions, (c) harnessing emotions productively, and (d) empathy, along with their behavioral correlates.

Goleman (1995) has suggested that the more emotional intelligence one has, the better able one is to accomplish developmentally appropriate tasks through the effective management of social relationships and of emotions.

Bogenschneider's (1996) work with risk and protective factors is typical of the field. As represented in Table 4.3, she has identified factors in the individual, peer group, family, school, and community that put an individual at risk for or protect an individual from negative personal outcomes. As mentioned earlier in this chapter, there is a continuum within a particular factor (e.g., family) from which behaviors indicate a condition of risk to which ones indicate a protective condition. This construction conflates the distinctions made here. For example, it describes that risk factors can be individual, family, or community without suggesting that a factor in one category may have more explanatory power than a factor in another. As presented earlier, social class status is a powerful explanatory factor in minority student achievement, certainly, in aggregate, more than an individual factor such as emotional intelligence. As we develop research and interventions on minority student achievement, addressing the differential impact of particular factors should be an important focus in the work. This paper advocates for a systematic analysis of the effect of each level on student performance.

Table 4.2 Characteristics of Emotional Intelligence (Goleman, 1995).

Characteristic	Descriptors
Emotional Self-Awareness	Improvement in recognizing and naming own emotions
	Better able to understand the causes of feelings
	Recognizing the difference between feelings and actions
Managing Emotions	Better frustration tolerance and anger management
	Fewer verbal put-downs, fights, classroom disruptions
	Better able to express anger appropriately, without fighting
	Fewer suspensions and expulsions
	Less aggressive or self-destructive behavior
	More positive feelings about self, school, and family
	Better at handling stress
Harnessing Emotions Productively	More responsible
	Better able to focus on the task at hand and pay attention
	Less impulsive, more self-control
	Improved scores on achievement tests
Empathy: Reading Emotions	Better able to take another person's perspective
	Improved empathy and sensitivity to others' feelings
	Better at listening to others
	Less loneliness and social anxiety

Cultural identity. Current research on minority student achievement indicates that an ethnic minority's sense of his or her cultural self may serve to facilitate his or her academic performance (Bass & Coleman, 1997; Chavous et al., 2003; Hrabowski, Maton, & Greif, 1998; Oyserman, Gant, & Ager, 1995). Within the resilience framework, the relevant hypothesis is that racial or ethnic identity is a personal factor that moderates between conditions of risk (social stratification and contextual factors) and desirable outcomes (e.g., high academic aspirations and efficacy; D. B. Miller, 1999). What limits investigation in this area are the challenges of defining the construct of racial or ethnic identity (Coleman et al., 2003) and of developing conceptually and psychometrically sound instruments to measure the construct.

When looking at individual factors that might explain the gap in minority student achievement, historically, it was presumed that differential academic orientation, ability, or motivation could explain underperformance in minority students. A bulk of recent research has refuted these claims, identifying that minority youth have similar or superior attitudes toward educational achievement, have attainment attitudes that in certain environments supersede peers in the majority group, believe that getting good grades is important, and work at the same level as peers (Arroyo & Zigler, 1995; Bok, 2003; Ferguson, 2002). In one of the largest studies of minority achievement, the Minority Student Achievement Network surveyed students in 15 school districts and found that the majority of students, regardless of ethnic membership, placed great value on academic success and reported essentially the same amount of homework time as students in the majority group, although rates of enrollment in higher level courses varied by ethnic group (Alson, 2003). These findings reveal that the gap for minority students cannot be explained by motivation or orientation hypotheses. In considering other factors, many authors have turned to internalized racism, stereotype threat, and ethnic identity as possible mechanisms that offer explanation for the minority achievement gap (Chavous et al., 2003; Oyserman et al., 1995; Steele & Aronson, 2000).

Bicultural competence. Gutter (2003), in an investigation of bicultural competence among successful African American women, provided an interesting finding concerning the relationship between cultural identity and behaviors that lead to success in a predominately White environment. The focus of Gutter's (2003) investigation was to test and extend LaFromboise, Coleman, and Gerton's (1993) theory of bicultural competence. This theory suggests that bicultural competence is a complex interaction between seven elements: (a) knowledge of both cultural groups, (b) positive attitudes toward both groups, (c) communication skills in both groups, (d) a role in both groups, (e) a support system in both groups, (f) bicultural efficacy, and (g) a sense of belonging in both groups. Fur-

Table 4.3 Risk and Protective Factors (Bogenschneider, 1996).

Primary Factor	Elements
Individual Risk Factors	Anti-social behavior
	Alienation or rebelliousness
	Favorable attitudes toward the problem behavior
Individual Protective Factors	Well-developed problem-solving skills and intellectual abilities
	Self-esteem, self-efficacy, personal responsibility
	Well-developed social and interpersonal skills
	Religious commitment
Family Risk Factors	Poor parental monitoring
	Distant, uninvolved, and inconsistent parenting
	Unclear family rules, expectations, and rewards
Family Protective Factors	A close relationship with at least one person
Peer Risk Factors	Association with peers engaged in similar behaviors
Peer Protective Factors	Truly intimate relationships
School Risk Factors	School transitions
	Academic failure
	Low commitment to school
School Protective Factors	Positive school experiences
Work Setting Risk Factors	Long work hours
	Stress of jobs
	Increased contact with older kids
	Increased financial autonomy
Work Setting Protective Factors	Required helpfulness
Community Risk Factors	Low socioeconomic status
	Complacent or permissive community laws and norms
	Low neighborhood attachment, community disorganization, and high mobility
	Media influences
Community Protective Factors	Belonging to a supportive community
	Bonding to family, school, and other social institutions

thermore, in a review of the literature on the psychological impact of being bicultural, these authors found that it had positive benefits and that a set of attitudes and skills makes up bicultural competence. They found that bicultural competence is the ability to effectively negotiate two cultures, either simultaneously or separately. They found that it has cognitive similarities to being bilingual, but that it was significantly more demanding at the affective level. What their review suggested, however, was that bicultural competence is a set of skills that may facilitate the ability for culturally diverse children to be successful in school. Furthermore, this suggests that being culturally competent in school is a factor in academic accomplishment, a construct relevant to all learners, regardless of race, class, or gender.

Gutter (2003) found that women who were successful in predominately White environments did demonstrate these dimensions of bicultural competence. Equally important is that the women in her study claimed that it was the strong sense of cultural identity—encouraged and developed by their families—that was the foundation upon which they based their efforts to become biculturally competent. Conversely, in an intervention to improve the academic performance of African American boys, Bass and Coleman (1997) found a different relationship. They created an intervention to enhance the cultural identity of these boys based on the Kwanza principles (see Coleman, Yang, & Kim, chapter 5, this volume, for more detail concerning this intervention). After 10 weeks, they found that the boys had an improved sense of cultural identity, but that their school performance had not improved. It was when the intervention focused on applying their positive sense of cultural self within a predominately White school, or on being bicultural, that their performance improved. Although the participants' positive sense of cultural identity improved during the first half of the intervention, once the intervention focused on how to apply that sense of

self in school, their grades as well as teacher ratings on in-class behavior (e.g., being prepared to work and completing homework improved).

Based on these investigations, it can be hypothesized that bicultural competence is a resilient factor for ethnic minorities. The more competent they are in both cultures the better their personal (e.g., self-esteem) and social (e.g., academic performance) adjustment will be (Berry, 2003; Phinney, 2003). Specifying these effects is an important focus of future research.

Coleman's (2007) process model of minority student achievement, summarized in this chapter, suggests that intellective competence in one factor among many that leads to a positive outcome. There is substantive evidence that student accomplishment is as much a function of social stratification and contextual factors as it is a function of individual ability. Schools, as institutions, are structured to replicate existing social hierarchies that are becoming increasingly inequitable. Increasingly, a child's class and race are the characteristics that determine his or her academic and career opportunities. School counselors are in a unique position to implement practices that appear to build resilience in children and help them overcome barriers to success. These practices involve strategies to trigger institutional and individual change.

Implications for School Counseling

The balance of this chapter will focus on two areas. The first is to summarize the range of interventions that seem to work with minority students to help them overcome barriers to academic accomplishment. The second area will focus on the school counselor's role in implementing these practices for all students.

What works for minority students?

1. *Family/Parental involvement:* The more parents and family are involved in the life of a school, the better position they are in to help their child meet school expectations. Helping parents learn how to be involved in schools so that they can support their children is an important function of a school counseling program. Ideally, a strategy for facilitating school involvement by parents should be articulated throughout the K–12 classrooms in a district.
2. *Community involvement:* Effective schools have high levels of community involvement. In fact, schools become a focal point of a community. As Dryfoos (1994) has suggested, full-service schools that provide multiple services to the community enhance students' accomplishments. Communities that are involved in the needs of K–12 students also help with needed resources. As is noted in the literature on truancy, one of the effective strategies for reducing truancy is building a working relationship with the local community. For example, communities with after-school programs for youth or with structured alternative programs and a close relationship with truancy court have reduced truancy rates (U.S. Department of Education, 1996).
3. *Nonacademic opportunities for involvement and success*: The more students are availed the opportunity to have success within a school, the more they will value and participate within the core functions of a school. Not every student is motivated to focus on his or her academic responsibilities. When, however, they become involved in nonacademic opportunities within the school, from drama or music to sports or student council, students get to learn that school is a meaningful institution for them, which translates into academic performance.
4. *Quality teachers with a focus on accomplishment:* Ladson-Billings (1994) demonstrated that there is no such thing as a one-size-fits-all teacher. Her work shows that teachers who are deeply committed to the accomplishments of students are effective teachers with a diverse array of learners. It is the central assumption of this chapter and this *Handbook* that a quality school counselor is as important as a quality teacher in having an impact on minority students' achievements.
5. *Culturally competent teachers (counselors)*: Ladson-Billings (1994) also demonstrated that being effective with one cultural group does not necessary mean one can be effective with all cultural groups. Being able to differentiate teaching or counseling services based on the context of a child's life allows teachers to effectively work with a culturally diverse array of students.
6. *Mastery learning:* Teachers who focus on the development of intellective competence and the mastery of context are more effective with a diverse array of students than teachers who teach to a theory of ability. Teachers, who focus on sharing content, rather than the mastery of that content, and who are therefore differentiating instruction, pace, and approach to help different learners master the content, facilitate student accomplishment.
7. *Respect:* Gregory (2006) has demonstrated that students are very responsive to levels of perceived respect. When students feel respected and cared for, they will actively engage in adult-mediated activities, such as school. If they feel judged and/or dismissed, they will actively disrupt the pro-

cess, even if such disruption leads to negative consequences.

8. *Being known:* Students who feel known by the adults in their environment are more likely to aspire to success in that context than students who have a sense of being anonymous. If students know that it means something to their teacher that they are there and engaged, it will mean something to the student to be there and be engaged. This can be accomplished by making sure there is an adult presence as spectators at events in which students get to demonstrate their competence from spoken word performance through school musicals and art exhibitions. Too often, the parents of the performers and the teacher who organizes the event are present, but other faculty and staff are not. It is also accomplished by knowing the names of students in the hall and talking with them, even if they are not in your class or on your roster. Being known can be accomplished by recognizing activities in which students are involved outside of school, or it can be as complex as expanding the recognition of student accomplishment outside of traditional areas such as academics or athletics.
9. *Facilitation of bicultural competence:* Negotiating multiple social contexts is difficult and taxing. Schools that help students learn and practice these skills are more effective than those that do not. Coleman, Yang, and Kim, chapter 35, in this *Handbook*, have addressed this process in more detail. The school counselor is in a unique position to help students think through how their membership in multiple cultural groups (e.g., culture of origin, culture of school, or culture of peers) affects their decision making concerning course selection, career goals, or even extracurricular activities. Gathering this information from individual students provides the school counselor an understanding of the manner in which a school may systematically disenfranchise—or include—students for involvement as a function of their cultural competence. For example, many schools that maintain an academic barrier to participation in school activities (e.g., drama or athletics) systematically exclude the students who may be in most need of being in an adult-mediated activity that will help them acquire the skills (e.g., self-regulation or communication) that are the foundation of academic accomplishment.

Many educators struggle with the paradox that programming for minority students may look very different from programming for majority students. They struggle with the concern that a different treatment may be an inequitable treatment. This struggle is embedded within the universalist conceit. This conceit starts with the premise that we are all the same or that the goal is to converge to some type of homogeneity. An alternate ideology draws evidence from the study of biology and economics, which demonstrate that difference adds value to a community. A differentiate economy and a diverse ecology are healthier are than those with high levels of homogeneity. For example, a cactus and Wandering Jew both need water, but it would be inequitable to give them the same amount of water. They would both fail to flourish if they were treated the same.

My core argument is that learning to effectively meet the needs of minority students within American public schools will lead the way to more effectively meeting the needs of all students in these schools. A tendency to value one type of student has led to increasing failure within the system. Learning to meet the needs of diverse students may lead to a flourishing system.

The school counselor can make a tremendous contribution to the development of a school that focuses on student accomplishment. It is important, however, that this contribution is guided not only by current practices, but also by a vision of how we can better serve students. Acceptance of the status quo, and our relatively low status within the current structure of schools, is to accept the many obstacles we face to providing quality counseling and guidance services to all students. To envision schools that allow us to prepare students to learn and facilitate their entry into their postsecondary lives is to find ways to truly transform our practice. Following are several dimensions of our role that are central to creating schools that focus on student accomplishment.

Caring communities. As Lindwall and Coleman (chapter 24, this volume) have suggested, school counselors have a vital role in creating the type of caring community in which all members feel they have a role and belong.

Focus on mastery of emotional intelligence. Being prepared to learn is a fundamental skill of accomplished students. Unfortunately, most developmental guidance lessons mirror traditional classrooms where the focus is on presenting the material at an appropriate developmental level and style, rather than mastery of the skill being taught (e.g., working in groups or managing conflict). School counselors can begin to model mastery learning with their teacher colleagues in three ways. The first is to implement curriculum that focuses on the master of emotional intelligence. The second is to collaborate with classroom teachers in the teaching and mastery of these skills. The third is to annually assess the level of emotional intelligence in the school and use this assessment data (analyzable by

class, gender, and ethnicity) to acknowledge success and redesign curriculum to meet unmet needs.

Educator. School counselors regularly consult with their colleagues concerning student needs. It is important that school counselors are also involved in the training of their colleagues in their area of strengths.

Cultural competence. School counselor training programs across the country have integrated training in multicultural counseling into their curriculums. Teacher education programs have also addressed issues of multicultural education (Grant & Gillette, 2006; Ladson-Billings, 2005; Zeichner, 1992) within their curriculum. School counselors should have the skills to facilitate conversations about cultural diversity and equity within a school and train teachers in the skills to work effectively with diverse parents, children, and colleagues.

Interpersonal skills/negotiation. As Gregory (2006) has noted, effective teachers with diverse students may have effective interpersonal skills and the ability to negotiate conflict. School counselors have the skills to help train teachers in these skill areas. Microskills (Ivey & Ivey, 2003), motivational interviewing (W. R. Miller & Rollnick, 2002), and conflict resolution (Conflict Resolution Network, 2006) are all areas in which school counselors can lead professional development activities for their colleagues as a way of improving these colleagues' skills and establishing the school counselor as an effective consultant in these areas.

Interventions. Although school counselors have a primary commitment to positive youth development through effective developmental guidance programs, they also have the skills and responsibility to meet the needs of those who are not experiencing success within the school. This is particularly true when this progress is being impeded through institutional discrimination. School counselors, once they identify sources of inequity, can intervene at both the institutional and personal levels. It is important, for example, to have programs to facilitate cultural identity (e.g., positive images of self as a function of race or gender) for middle-school students, programs that help students who do not have access to precollege training or information, or programs that address the socioemotional aspects of truancy. School counselors need to be involved in the development, implementation, and evaluation of such programs. This is an excellent area in which they can collaborate with school counselor training programs to help develop and evaluate such programs and to provide practicum students to help with the running of such programs.

Data driven decision making. School counselors are facing a delicate balance between their commitment to direct service and the call for playing an administrative role within a school. Many calls for accountability within school counseling appear to ask the school counselor to become involved in the collection and analysis of student performance data. A different perspective is to suggest that school counselors become more proficient at applying social science principles to their work within schools. This does not mean becoming the administrator of the data process, but using social science skills to use the data to guide decisions within the school. This is most important when it comes to developing, implementing, and evaluating programming that addresses the inequitable effects of social stratification factors within modern American schools.

Conclusion

With an economy that has changed drastically in the past 50 years and a school system that looks and acts the same as it did in the 1950s, it is no wonder that there are areas of perceived failures in the school system. Over the next decade, schools will be radically reconfigured to meet the needs of a modern economy. This chapter highlights the importance of considering social stratification factors as we engage in this transformation and of encouraging school counselors to take a leadership role in ensuring that the central role that emotional intelligence plays in student accomplishment is recognized and integrated into the change. Specifically, school counselors are encouraged to use their social science and clinical training to develop, implement, and evaluate (a) training programs for their colleagues in cultural competence and interpersonal skills, and (b) training programs for their students in emotional intelligence, which has a demonstrable impact on student accomplishment.

Author's Note: This chapter integrates work and conversations that the author has had with Lali McCubbin, Romana Norton, Gina Miranda, Sara Karcher, Collette Bina, Shannon Casey-Cannon, Laura Fillingame, Amanda Sommerfeld, Jennifer Lindwall, William Hoyt, and multiple other students and colleagues with whom I have discussed these ideas in meetings, classrooms, and workshops.

V
UNDERSTANDING YOURSELF AS A SCHOOL COUNSELOR

CHRISTINE J. YEH AND STEPHANIE T. PITUC
University of San Francisco

> Most people would kill for the opportunity to seek a better life in America. My friends told me that Americans are so rich that money is strewn on the ground like garbage. A friend told me to stick gum on my shoe so I could pick up the money off the street without looking bad. Although I believed these myths, my life in a "good" American school was quite different. School was filled with racial problems. People of color did not understand each other and no one understood me. But everyone united in hating the Haitians. We were stereotyped as having bad hygiene, carriers of diseases, and people feared us because we practiced voodoo. People called me "HBO" for Haitian Body Odor. School was traumatic. I never had problems with who I was before because everyone in Haiti was the same as me. Now I had very negative feelings about who I was. I was constantly teased after school. I began to internalize the stereotypes and hate myself. The only way to survive was to speak and look like everyone else. I refused to talk or participate in class for fear someone would hear my accent. I had transformed from a very outgoing self-assured child in Haiti to a withdrawn depressed kid with a low self-esteem. I did not speak in public or admit I was Haiti until I went to college.
>
> **(quote from a Haitian immigrant student)**

If you were a school counselor for this student, how would you address these problems? You might focus on the student's specific concerns, such as his "low self-esteem," "lack of confidence," or "depression." Many school-age immigrant youth, however, tend to keep their problems to themselves due to shame and embarrassment (e.g., Yeh et al., 2003; Yeh, Ma, et al., 2005). This student reported that he stayed quiet in class, tried hard to act and look like others, and did not even admit he is Haitian to himself anymore. In fact, due to cultural stigmas and racist encounters, a student may hide and internalize his feelings and experiences (D. W. Sue, 2001). As a school counselor, you might pathologize his experiences and attribute his withdrawn and quiet behavior in class to low academic performance, lack of interest in school, lack of effort and motivation, or depression, but there are multiple ways to understand the students we work with in schools. The purpose of this chapter is to recognize the important role that cultural values and worldview play when working with students. Specifically, as school counselors, we often fail to realize our own unconscious contributions to everyday interactions and to realize how our values and worldviews influence our interpretations of student experiences. In this chapter, we will pay particular attention to work with students of color and offer case examples to highlight our ideas. In addition, we will offer specific suggestions for how school counselors may explore their own biases, stereotypes, and assumptions.

In the past few decades, there have been, and will continue to be, dramatic changes in our society's demographics that will have a tremendous impact on the number of students of color and immigrants in our schools (Bemak & Chung, 2003). This increase in cultural and ethnic diversity has important implications for the field of school counseling (Sciarra, 2001). Counselors and educators need not only to be cognizant of the unique concerns of diverse students but also to recognize how their own cultural backgrounds and counselor–student interactions influence the school climate and students' psychological development. In fact, working with students of color must

be viewed as a reciprocal process of growth and learning between counselor and student.

Worldview

Research and literature in the field of school counseling tends to focus on specific counseling and intervention techniques, skills, theoretical approaches, and strategies as well as particular student issues and concerns (e.g., eating disorders, violence, bullying), and with valid reason. School counselors must be informed and knowledgeable about the various problems facing our school-age children and youth. However, one of the most critical aspects to the process of counseling involves recognizing how our *own* cultural, personal, and educational background and experiences influences our interpretations, and subsequent understanding and management, of student development. For example, many years ago, when I (Christine) was one of a few students of color at a predominantly White K–12 school, I always thought that my own feelings of difference and isolation were my problem, not the students', teachers', or staffs' problems. Similar to the case of the Haitian student, I felt that if I just fit in and acted like everyone else, no one would notice how different I felt inside.

There is a quote by Anais Nin (as cited in Lewis, 2007) that states, "We don't see things as they are. We see them as we are." Specifically, our perception of reality is grounded in our own individual beliefs about the world and constructed by sociocultural interactions. *Worldview* refers to how a person sees the world (Ivey, Ivey, & Simek-Morgan, 1997), one's subjective reality (Ibrahim, 1985), or one's philosophy of life (D. Sue & Sue, 2003). According to Sodowsky and Johnson's (1994) review of culturally learned assumptions and values, worldview is associated with a person's relational, moral, spiritual, educational, economic, or political encounters. Worldview is also shaped by one's reference group, such racial or ethnic background, as well as one's geographic location and family system. Moreover, worldview has a strong grounding in cultural beliefs about knowledge, logic, and interpretation. Recent writings on worldview have expanded current definitions to include group identity, self-concept, language, and interpretations and perceptions of counseling (Dana, 1993).

Present understandings of worldview suggest that, for a given set of student behaviors, feelings, thoughts, and actions, there are many possible interpretations, many of which are culturally embedded. How a student describes his or her experiences in or outside of the classroom, and how a school counselor then makes meaning of these experiences, is largely based on the worldviews of both the school counselor and the student. Thus, when working with students of color, school counselors must learn to question their own assumptions, stereotypes, and biases. School counseling involves understanding not only students, but also yourself, your identity, where you come from, and how your education, family, social upbringing, class, and race and ethnicity—to name a few—shape who you are as a person.

In the case of the Haitian student, what are our assumptions when meeting someone from another country? How do media representations of and political relations with Haiti influence our impressions of this student? Although we may not be aware of it, any previous exposure to Haitian culture (especially negative stereotypes) may influence our assessment and evaluation of this student. Likewise, it was the student's belief that appearing different from others was a bad thing, perhaps because he came from a culture that emphasized homogeneity and collectivism (see Markus & Kitayama, 1991). Hence, according to the student's worldview, fitting in was a culturally and socially desirable way of coping with school racism.

A counselor's worldview is inextricably linked with his or her clinical intentions and actions (Ivey et al., 1997). However, many school counselors are not aware of their biases and assumptions, and their actions may contribute to an oppressive environment for students of color. Hence, increasing self-awareness of one's cultural values and worldview will allow school counselors to better understand their roles and participation in terms of individual, cultural, and institutional racism (for detailed definitions and discussion, see D. Sue & Sue, 2003).

Locus of Control and Locus of Responsibility

D. Sue and Sue (2003) described worldview as "how a person perceives his or her relationship to the world (nature, institutions, other people, etc.)" (p. 267). Further, "[N]ot only are worldviews composed of our attitudes, values, opinions, and concepts, but also they may affect how we think, define events, make decisions, and behave" (p. 268). If you have traveled, lived, and worked in a different culture or country, you know that members in various cultural settings perceive communication patterns, identity, relationships, and so forth, in a multitude of ways (Sodowsky & Johnson, 1994; D. Sue & Sue). As previously described, these cultural differences are referred to as cultural values or worldviews. Although the constructs of worldview and culture have been used interchangeably, *culture* refers to "the artifacts, achievements, and symbols of a people, and all of their actions and patterns of behavior" (Sodowsky & Johnson, 1994, p. 61). Thus, culture is observable and visible. In contrast, worldview is not directly communicated because it refers to an individual's relationship to the world (D. Sue & Sue) or one's assumptions and philosophy about how the world works (Ivey et al., 1997; Sire, 1976). An

example of worldview that has been used to differentiate between White Americans and ethnic and racial minorities is *Locus of Control* (LOC) and *Locus of Responsibility* (LOR; D. Sue & Sue).

LOC refers to people's perception of how much they are able to control their situations and their surrounding context (Rotter, 1966, 1975; Sodowsky & Johnson, 1994). LOC is understood along a continuum with two dichotomous ends, external versus internal LOC. An *internal LOC* assumes that one believes one is in control of one's own experiences and environment. In contrast, *external LOC* entails perceiving control of one's life to be outside of oneself, such as due to religious/spiritual beliefs, nature, fate, chance, or contextual factors (e.g., geographical location, the school system, or society). As in the case of the Haitian student, his external LOC influenced his perception that his situation was shaped by his outside environment. Specifically, he felt that his behaviors, attitudes, and values were shaped by his geographic location and school setting. For example, he believed he was a different person when he was in the United States versus who he was in Haiti. In fact, research has shown that many ethnic minority groups, women, and people from lower socioeconomic statuses (for an excellent review, see D. Sue & Sue, 2003) tend to endorse an external versus internal LOC.

LOR refers to the amount of responsibility one attributes to successes and failures (Sodowsky & Johnson, 1994). LOR is also conceptualized along a continuum with two polar opposite ends. An *internal LOR* suggests that one attributes individual responsibility to achievements and weaknesses, and an *external LOR* is defined as perceiving responsibility to be within one's context, in others, or in the environment. In the case of the Haitian student, his external LOR attributed his poor performance in school to the school environment and context. In particular, he believed he was not doing well because of the racist climate in school.

It is fairly common in contemporary American society to value individual responsibility, accountability, and control. Idioms in the United States, such as "pull yourself up by your bootstraps" and "the squeaky wheel gets the grease," underscore the embedded assumption of autonomy and self-determination in our society and in our schools. These sayings refer to the importance of using individual efforts to improve your situation or to stand out in a crowd. If we apply these implicit cultural messages to the case of the Haitian student, a school counselor may interpret his withdrawn and quiet behavior through the lens of an internal LOR. According to this perspective, the student may be performing poorly due to lack of self-motivation, lack of initiative, and poor learning skills. All of these reasons hold the student *personally accountable* for his academic and social performance. Relatedly, an internal LOR in this case blames the student for his problems, and it assumes an internal LOC in which he is individually responsible for *changing* the situation.

There are numerous ways in which LOC and LOR impact our counseling across cultural groups (Roysicar-Sodowsky & Frey, 2003). Hence, it is imperative that we understand these tendencies in our worldview in order for us to bridge potential cultural gaps. For example, in our educational system, an overrepresentation of bilingual students is inappropriately referred to special education with "learning disabilities" (Ortiz & Maldonado-Colon, 1986). An internal LOR would attribute this overrepresentation in special education to the individual. Specifically, personal inadequacies, poor performance, low concentration, lack of motivation, and lack of effort would be used to explain why an individual is diagnosed as having a learning disability. One explanation may be that the individual is not applying himself or herself, not working hard enough, not born with the adequate tools to succeed, or not motivated by the course material. Hence, the blame or responsibility is placed on the individual, not on the system.

In contrast, using an external LOR, the overrepresentation of bilingual students who are referred to special education in the school system could be attributed to the context in which students of color must operate and learn (Locke & Parker, 1994). For example, rather than attribute blame to the individual, it would be important to consider aspects of the students' learning environment that contribute to a subsequent placement in special education (Ortiz & Maldonado-Colon, 1986). Alternative explanations include linguistic and cultural differences, experiences with racial discrimination, fewer educational opportunities, and biases in assessment procedures that place them at increased risk for diagnosis of a learning disability or behavioral disorder (Facundo, Nuttall, & Walton, 1994).

The answer may not be so clear-cut, and we need to consider that it may be a combination of both an internal and external LOC/LOR. For every student concern and issue that we encounter, there are multiple ways of approaching it based on differing worldviews. Part of being an effective multicultural school counselor is to understand our own tendencies in terms of LOC and LOR. Do we, as school counselors, have a tendency to look within the individual or to look at the system? Is our theoretical foundation and skills training based on an assumption of individualism? Research indicates that specific cultural groups may be oriented toward one approach over the other (see Locke & Parker, 1994). As discussed by Locke and Parker, a Native American student may have cultural values that dictate an external orientation. On the other hand, an overrepresentation of African Americans can live at or below the poverty level in the United States; their lower standard of living could be attributed to personal inadequacies

or attributed to discrimination and lack of opportunities. Being aware of such biases and multiple interpretations will help us understand how our worldview may shape a student's experience in the school setting.

Even if we endorse an external LOR, a potential frustration is realizing how difficult it is to change our culturally diverse students' experiences with racism and discrimination. The reality is that we cannot change the system immediately. We can work toward that goal collaboratively, but most importantly, we can recognize the contexts in which our students function. The powerlessness we experience as school counselors in not being able to change the system is only a fraction of what our students must experience on a daily basis.

Assessment of Worldview

In multicultural counseling, assessment of your own and students' worldviews is a critical part of understanding the client's frame of reference (Carter, 1991; Ibrahim, Roysicar-Sodowsky, & Ohnishi, 2001). Some of the seminal conceptualizations of worldview by Ibrahim (1984) were influenced by the existential values model (C. K. Kluckhohn, 1951, 1956; F. R. Kluckhohn & Strodtbeck, 1961), and Ibrahim and Kahn (1987) created the Scale to Assess Worldview© (SAWV). According to research conducted by Sadlak and Ibrahim (1986, as cited in Ibrahim et al., 2001) and Cunningham-Warburton (1988, as cited in Ibrahim et al., 2001) using the SAWV, a shared frame of reference in worldview (e.g., common beliefs, values, and assumptions) contributed to successful engagement in counseling along with counselor effectiveness and self-efficacy. The SAWV has also been used to illustrate similarities and differences across various cultural groups (Ibrahim & Owen, 1994).

Cultural Values

Counselors who have not explored their worldviews and who continue to work with culturally diverse clients may be at risk for reinforcing cultural oppression (D. Sue & Sue, 2003). A critical aspect of understanding worldview relates to the value orientation model of worldviews (cultural values) by F. R. Kluckhohn and Strodtbeck (1961).

According to F. R. Kluckhohn and Strodtbeck (1961), basic values are core concepts that combine cognitive, conative, and affective elements. These elements are shaped by one's social and cultural setting and may be experienced and interpreted differentially across individuals. The notion of value orientations continues beyond basic values to include existential themes. Various cultural groups create cognitions, emotions, and tendencies from their beliefs about the world and life and form existential propositions (Carter & Helms, 1990; Yeh, Carter, & Pieterse, 2004). *Cultural value orientations* are thought to be culturally specific systems or perspectives for understanding the world. While there are inevitable within-group differences in cultural values, some homogeneity across cultural worldviews allows for direct empirical investigation and illustrates cultural values that are more general and that, to a certain degree, may be racially defined.

The F. R. Kluckhohn and Strodtbeck (1961) model of cultural value orientations may help school counselors to better understand their own, as well as their clients', worldviews and subsequent beliefs and interactions. Kluckhohn and Strodtbeck contended that individuals across races must address five common existential issues, each with three potential solutions or alternatives: (a) what is the character of human nature? (evil, mixed, or good); (b) what is the person–nature relationship? (subjugation, harmony, or mastery); (c) what is the proper temporal focus? (past, present, or future); (d) what is the proper manner of human activity? (being, being-in-becoming, or doing); and (e) what is the proper focus of social relations? (lineal, collateral, or individual). The answers to these questions determine and represent particular cultural value orientations.

Previous researchers have examined adaptations of the F. R. Kluckhohn and Strodtbeck (1961) model to explain how the value-orientation of a particular group may have unique patterns or value structures that may be understood independently of other racial groups (Carter & Helms, 1987; Carter & Parks, 1992). Moreover, D. Sue and Sue (2003) argued,

> Cultures differ also in their attitudes toward activity. In White culture, doing is valued over being, or even being-in-becoming. There is a strong belief that one's own worth is measured by task accomplishments. In White culture, statements such as "do something" indicate the positive value placed on action. Likewise, when someone is involved in being, it may be described as "hanging out" or "killing time." In most cases these represent pejorative statements. In counseling and therapy, the perceived "inaction" of a client who may adhere to a "being" orientation is usually associated with some form of personal inadequacy. (pp. 269–270)

The influence of cultural values cannot be separated from a school counselor's style of interaction and case conceptualizations. Several researchers and theorists have discussed at length how White cultural patterns of communication and conceptions of self are embedded in traditional counseling techniques (e.g., D. Sue & Sue; Yeh, Hunter, Madan-Bahel, Chiang, & Kwong, 2004; Yeh & Hwang, 1999). Specifically, many counseling techniques underscore the importance of direct, verbal, communication, and assertive problem

solving as a means of coping and the importance of emotional catharsis as a means to alleviate psychological symptoms (Yeh, 2000). However, school counselors must be aware of indigenous and communal notions of health and healing (D. Sue & Sue, 2003; Yeh, Hunter, et al., 2004; Yeh & Hwang, 1999) and of how their own cultural and familial upbringing may shape their counseling interactions (D. Sue & Sue).

White Racial Identity

Racial identity theory is helpful in examining one's worldview and interactions with the others. Racial identity models describe patterns of thoughts, feelings, and behaviors associated with one's own race and that of the dominant White culture (Helms & Cook, 1999). In this chapter, we focus on White racial identity, as all too often, discussions about race focus on people of color, whereas White individuals may not consider themselves as racial beings and the implications of one's Whiteness (for a review of racial identity models for people of color, see Helms, 1995). In particular, if the school counselor is from the White, European-American majority culture, it would be necessary for him or her to understand his or her own White racial identity (see Helms & Cook). White racial identity development is the process of a White individual's understanding of him- or herself as a racial being as well as his or her relationship with non-White individuals (Helms & Cook). Specifically, Helms asserted that most White individuals tend to believe that they are entitled to privileges, especially when they are socialized in an environment in which Whites are valued more in comparison with other racial groups. White individuals protect this privilege by rejecting their own racial status and denying attempts to threaten the racial status quo. As a result, developing a positive sense of self as a White person must entail realizing and abandoning the typical strategies Whites endorse in order to maintain their position in society (Helms & Cook).

White racial identity (Helms, 1995; Helms & Carter, 1990; Helms & Cook, 1999) involves the progression through a series of developmental statuses: contact (lack of consciousness of one's own race), disintegration (guilt and confusion regarding race), reintegration (White is considered to be superior), pseudoindependence (thinks about other groups racial problems and tries to help them acculturate, integrate, and fit in), immersion/emmersion (seeks to reeducate Whites about racism), and autonomy (able to identify White as not necessarily associated with being a racist).

In the case of the Haitian student, one might suggest that other students in the school context are in the contact status of White racial identity since they seem to lack an awareness of their own White status and seem to devalue that which is not White (in this case, being from Haiti). It would be particularly important in this situation for White counselors and teachers of the Haitian student to be aware of how the White students' racism, as well as their own racism, impacts their interactions with the Haitian student. Counselors who are at a higher level of White racial identity (e.g., immersion/emmersion and autonomy) might in fact seek to educate others about their own racist attitudes and behaviors toward the student and could incorporate counseling techniques and pedagogical practices that would exhibit antiracist beliefs and value cultural diversity. Depending upon the racial identity of the school counselor and that of the student, there may be predicted qualities of the counseling relationship and therapeutic process (see Carter, 1995; see Helms & Cook, 1999, regarding Helm's interactional model of racial identity in counseling dyads).

White Privilege

Related to White racial identity is the notion of White privilege (for in-depth discussion, see Neville, Worthington, & Spanierman, 2001), which refers to having unearned access to institutions (e.g., health care, housing, business, hospitals, schools), various settings (e.g., restaurants, neighborhoods, school districts, employment, credit, and tax benefits. It means that you are not discriminated against, and others assume you are intelligent, hardworking, and competent (Lazos Vargas, 1999) because you have White skin. McIntosh (1988) described White privilege as an "invisible package of unearned assets, which I can count on cashing in each day, but about which I was 'meant to remain oblivious'" (p. 10). McIntosh discussed these privileges as providing her with a sense of normality, of fitting in, and of being average. These assets also provided her with the necessary criteria to "[e]scape penalties or dangers which others suffer" (p. 11).

White privilege creates a system of race-based social benefits, rights, and opportunities that leads to a sense of entitlement as well as social and material advantages of White people (Neville et al., 2001). Neville and colleagues described White privilege as multidimensional and constructed on micro- and macrolevels. Microlevels focus on advantages that are observed at the individual and group level (e.g., a sense of entitlement to resources; p. 262). Whereas, macrolevel privileges are structural in nature and relate to having unearned entry, benefits, and immunities within various institutions (see the previously mentioned list). Neville and colleagues provided a list of such advantages including graduation from 4-year colleges, homeownership, health care, computer technology in schools, small class size, higher salaries, and so forth (p. 263; National Center for Education Statistics, 1997).

It seems that an essential aspect of working with students of color is being able to understand the role of White privilege in the school setting (as well as in other social systems in the student's life) and one's own White racial identity. On a related note, school counseling training programs should incorporate consideration of one's own experiences and participation with individual, institutional, and cultural racism. For example, how might the institutional racist structures of school (hierarchy of racial power, pedagogical decisions based on race, school activities, etc.) create and reinforce feelings of invisibility among students of color (Franklin, 1999; Yeh, 1999)?

It is critical for school counselors to be aware of their White privilege (if they are White) and/or aware of the dynamics associated with Whiteness at their school settings. White privilege cannot be separated from issues related to power. Moreover, White privilege provides a racial hierarchy in the school setting which normalizes and favors Whiteness, "[T]he sociocultural norms, values, modes of communication, and standard procedures that govern everyday life. . . . As a result, White privilege is institutionalized, based in White ethnocentric definitions of self and other, good and evil, right and wrong, and normal and abnormal" (Neville et al., 2001, p. 264).

Exploration of Whiteness is an often painful, emotional process that results in numerous types of emotional reactions. For example, some counselors (or counselor-trainees) may express feelings of guilt and shame (Neville et al., 2001; D. W. Sue, 2003; Thompson & Neville, 1999) as they discover their own privilege. Some counselors may feel angry that they are "made to feel bad about something they cannot control." They may wonder why people of color cannot "move on" from talking about race and just try to all get along. Oftentimes, this reaction is related to a misinterpretation of racism as a specific act (e.g., hate crime) versus a culturally embedded system of structures and norms. Other counselors may deny their own privilege as a way to consciously or unconsciously protect and maintain their benefits. And many counselors will experience all of the reactions listed previously. The exploration of Whiteness is a long process and cannot be oversimplified as an academic task. This deeply personal journey of discovery requires a constant evaluation of one's environment, relationships, interactions, behaviors, beliefs, values, and so forth.

Acculturation and Identity

When exploring White privilege and cultural norms, it is also important to recognize culturally informed ways of being that differ and conflict with the White majority. In addition to knowing about one's self (cultural self-awareness), school counselors must also be familiar with the cultural backgrounds and values of their students and how these backgrounds shape students' learning environment, relationships, communication patterns, and experiences. Oftentimes, students from varying cultural backgrounds must negotiate conflicting values from their culture of origin and values from the dominant culture (Roysicar-Sodowsky & Frey, 2003; Yeh, et al., 2003; Yeh, Ma, et al., 2005). Such cultural conflicts are most apparent as students of color try to negotiate contrasting learning styles and expectations (Yeh, Kim, Pituc, & Lee, 2005). School counselors must strive to be knowledgeable of such cultural differences and work with students to manage conflicting value systems.

To quote a ninth grade, Puerto Rican student,

> When I first came to America everything seemed so strange, the people, the clothes, the smells, the food, the music. My whole world was really messed up and confusing and I didn't know how to make sense of anything. Everything that I loved and everything that was familiar to me was now gone.

Students of color are a hetereogeneous group representing many different ethnic backgrounds, cultural histories, and varied levels of assimilation to American culture. Important aspects of understanding the experiences of students of color involve understanding their racial and ethnic identity development as well as their levels of acculturation. Knowledge about students' identities and acculturation informs counselor–student interactions and communication styles in the counseling relationship.

The construct of *acculturation* has been defined in numerous ways in the past several decades (Berry, 1980; Cuellar, Arnold, & Maldonado, 1995; Kim & Abreu, 2001). According to Berry (1989), acculturation is the process that individuals experience in response to shifting cultural settings. Acculturation strategies are techniques and skills individuals utilize in relating to a dominant society. Berry (1989) contended that there are four main acculturation strategies: (a) assimilation, (b) separation, (c) integration, and (d) marginalization.

Specifically, *assimilation* refers to when an acculturating student does not wish to keep his or her cultural identity and seeks regular interaction with the dominant culture. A student endorsing this strategy may deny his or her cultural background, may interact with only White students, and may idealize White culture and values. *Separation* refers to when a student chooses to hold onto his or her culture of origin, rather than participating actively in the dominant society. There is a desire to avoid interaction with others in the mainstream culture. Students utilizing this strategy may tend to keep to themselves and be quiet

in classes. They may be reluctant to participate in group activities and discussions. They may also be reluctant to learn English and embrace styles of interaction that are more "American" (Berry, 1980, 1989).

Integration refers to an individual's interest in maintaining both his or her culture of origin and American culture. In this situation, some degree of cultural identity is maintained while actively participating and interacting in the larger dominant social network. Students who engage in this strategy may have friendships and interactional styles that reflect both the dominant culture as well as their cultures of origin.

Marginalization is a strategy that entails little or no interest in maintaining one's cultural identity and minimal interest in having relationships with others from the dominant culture (primarily rooted in experiences with discrimination). Students who use this strategy in many ways float from cultural contexts (i.e., American and their cultures of origin), and yet they do not feel as if they fit in with either. These students may feel alienated and alone and are often quiet and withdrawn in class. Although they may experience a tremendous amount of psychological conflict, they rarely express these feelings openly (Berry, 1980, 1989).

In the case of the Haitian student, his acculturation strategy was a combination of assimilation and marginalization. Due to numerous racist encounters, he denied his own cultural background and tried to look, speak, and act White as a means of survival. He believed that being and acting White was somehow better than acting and behaving Haitian; thus, he internalized the racist messages he was receiving. Although he attempted to assimilate, many people in the dominant culture continued to reject him based on his skin color, accent, and interactional styles. Rejected by White culture, and no longer fitting in with Haitian culture, the student was marginalized.

Such experiences with marginalization are not uncommon. In my experience at various school settings, one of the most frequent concerns that I encountered as a counselor with students of color was their perceptions that they did not fit in. Like the Haitian student, they were rejected by White students, as well as students from their own cultural backgrounds. In fact, being in a White-dominated school (or even a school with White norms and/or a primarily White staff and teachers) often alienates students of color from their own cultural community. Because of such marginalization, students of color may become depressed, alienated, and withdrawn.

When considering acculturation strategies, it is especially important to consider how the various strategies may impact student learning, behavior, presenting concerns, and interaction styles. In addition, it is also important to understand how, as a school counselor, you may misinterpret such strategies as deficiencies in academic abilities. For example, if a student is marginalized, he or she may feel inadequate, may sit apart from other students, and may not engage in class discussions. The student may also miss class due to depression or somatic complaints. The teachers and counselor of this student need to be careful not to misinterpret these reactions and behaviors as being academically grounded. The withdrawn behavior should not be seen as the student's inability to understand the material, and the lack of involvement and initiative in class discussions should not be viewed as representative of a learning disability.

Numerous factors can impact a student's level of acculturation or assimilation (Berry, 1980, 1989). In particular, level of schooling, employment, urbanization, popular culture, political participation, religion, language, daily customs, and social relations all need to be considered as essential contributing influences to how a student interacts with dominant society. Specifically, students are exposed to many of these factors in classrooms, curriculum, and peer relations in school. For the Haitian student, interpersonal interactions and classroom culture seemed to mandate that he assimilate in order to survive the largely White environment.

Acculturation and cultural adjustment can also be very emotionally and socially difficult and scary for students, and counselors need to be aware of possible negative reactions to being in a new cultural environment (Yeh et al., 2003; Yeh, Ma, et al., 2005). Two possible negative responses to acculturation are acculturative stress (Berry 1989; Bemak & Chung, 2003; Yeh, 2003) and culture shock (Lynch, 1992).

Acculturative stress refers to the stressors and stress behaviors that stem from the acculturation experience. Examples include mental health symptoms such as anxiety and depression, marginalization and alienation, psychosomatic symptoms, and identity conflict (Sodowsky & Lai, 1997; Yeh, 2003). C*ulture shock* refers to a number of disorienting experiences that occur when an individual's basic values, beliefs, and patterns of behavior are challenged by culturally contrasting values, beliefs, and behaviors (Lynch, 1992). According to Lynch, negative responses to the acculturation process occur when (a) the typical strategies that the student uses to deal with problems, make decisions, and socially interact are no longer effective; (b) the student experiences an overpowering sense of uneasiness and discomfort with his or her new cultural setting; and (c) acculturative distress may be exhibited emotionally or physically with anger, depression, anxiety, or illness. When a student is experiencing such reactions, it is hard to engage in positive constructive strategies (p. 24).

Students who experience such negative reactions may withdraw from their peers and class or take numerous sick days from school. These reactions are important

to consider when evaluating counselor–student and student–student interactions. Too frequently, poor academic performance and extended school absences are attributed to low student intelligence or achievement. Many school counselors have reported that they are referred students of color for "academic" counseling, only to discover that their situation was grounded in their negative experiences with acculturation and culture shock.

Understanding the process of acculturation is especially relevant when considering a student's sense of self. A particularly challenging aspect of acculturation is coming to terms with multiple cultural value systems (Yeh et al., 2003; Yeh, Ma, et al., 2005). Although students of color must negotiate various aspects of identity and self, an implicit expectation in their development is to express themselves in terms of coherent and stable identities (Yeh & Hwang, 2000). As we learned from the Haitian student, he did not feel comfortable identifying as both Haitian and American. He felt as if he needed to choose one identity in order to fit in.

The Multidimensionality of Ethnic Identity

To quote a 10th grade, Chinese-American girl,

> I do not know who I am. Am I the good Chinese daughter? Am I an American teenager? I always feel I am letting my parents down when I am with my friends because I act so American, but I also feel I will never really be American with my White friends. I never feel really comfortable with myself anymore because I have to act so many different ways all the time.

With students of color, ethnic identity or self should be understood as multidimensional (Phinney, 1996; Yeh & Huang, 1996) and dynamic (Yeh & Hwang, 2000). A student's ethnic identity is an evolving process that refers to individual shifts over time in identification, attitudes, values, and behavior through exposure to different cultures (Berry, Trimble, & Olmedo, 1986). Yeh and Huang asserted that ethnic identity may also be influenced by differing social, cultural, and educational contexts; family and peer relationships; and geography. In this chapter, we will only briefly touch upon the literature on ethnic identity and self as it relates to understanding worldviews and assumptions. For more detailed discussions of these issues, refer to the chapters in this *Handbook* by Casey-Cannon (chapter 9, this volume) and Coleman, Yang, and Cho Kim (chapter 35, this volume).

Yeh and Huang (1996) examined Asian American youth and discovered that ethnic identity development is strongly shaped by one's social setting and environment, such as geographic location, educational context, relationships, stereotypes, and racism. Yeh and Huang further contended that ethnic identity development theories should consider the situational specificity of self in collectivistic cultures. Current models of identity development assume that self is formed and influenced by internal processes rather than external factors. Cultural context is especially relevant for students of color who must constantly negotiate selves across various ethnic, racial, and cultural values, beliefs, and behaviors.

To fully comprehend the complexity and malleability of a student's ethnic identity, it is critical that counselors recognize how relational and cultural contexts contribute to one's sense of self. The literature on cultural notions of self describes how a culture's inclination toward independence or interdependence may shape identity. The independent self, which is representative of many Western cultures, may be described in part as a coherent, separate, and decontextualized entity containing specific dispositional attributes. According to Markus and Kitayama (1991),

> [A]chieving the cultural goal of independence requires construing oneself as an individual whose behavior is organized and made meaningful primarily by reference to one's own internal thoughts, feelings and actions, rather than by reference to the thoughts feelings and actions of others. (p. 226)

If we consider the quote at the beginning of this section from the Chinese-American girl, it seems apparent that it is not desirable in U.S. society to have more than one identity. She seems conflicted about who she is and how she should behave. Her confusion, however, may be rooted in an American emphasis on having a stable and coherent sense of self. A singular self is impossible to achieve for most culturally diverse youth because they must operate in many differing cultural systems.

As a counselor, do you value students who present strong, consistent voices and identities? What does this look like? For example, do you ask your clients "what are your preferences," "what do you want in life," or "how can you pursue what matters to you"? Do your counseling practices seem to emphasize forming and developing an independent and singular sense of self (e.g., "Do you feel more American or Chinese?")? Do you encourage multiple ways of being and interacting (e.g., "How can you nurture the various cultures you experience?")? See Yeh and Hwang (1999) for more detailed discussion and case analysis of working with clients with multiple and shifting cultural selves.

In the case of the Chinese-American girl, although she seemed confused about her different identities, she was,

in fact, exhibiting the ability to negotiate differing self-systems and cultural values. Contrary to values emphasizing rigid individualism, such behavior is quite adaptive for students of color. Another way to consider how interdependent selves are manifested across cultural contexts is through the concept of bicultural competence (LaFramboise, Coleman, & Gerton, 1993). *Bicultural competence* is the integration of two cultures without feeling the tension between the two (Domanico, Crawford, & Wolfe, 1994). According to the alternation model of bicultural competence (LaFromboise et al.) an individual can adapt his or her behavior to a given social or cultural context without having to commit to a specific cultural identity. The ability to adjust across situational domains may include using different languages, as well as different problem-solving, coping, interpersonal, communication, and motivational styles of interaction (LaFromboise et al.). It would be important for a counselor to encourage her bicultural competence as a necessary aspect of being from a collectivistic culture.

Because most students of color do not fit into the dichotomous categories of interdependent or independent, cultural labels should not be conceptualized in stereotypical, polar terms. It is essential for counselors to be able to adapt and adjust to various aspects of students' multidimensional and shifting selves. As a school counselor, try to avoid pressuring students to pinpoint their beliefs, values, or styles of interactions. Instead, help them explore and recognize how varying cultural contexts influenced and shaped their ways of being a person. If appropriate, try also to encourage students to appreciate these dynamic aspects of their selves and not to feel pressure to choose only one cultural identity.

As in the case of the Haitian student, if he had encountered counselors and teachers who had created multicultural inclusive settings that encouraged Haitian as well as American aspects of his self, perhaps his experiences in school would have been more enriching. If his teachers and counselors had been more open to his culturally embedded styles of interaction and belief system, he may not have felt the pressure to deny his own cultural heritage. If his teachers and counselors were aware of their own assumptions and biases in working with students, perhaps he would not have internalized all of the discrimination he felt. Unfortunately, the case of the Haitian student is not unique, but increasingly more common.

Case Study: Amy

Amy is a 32-year-old, White, European-American (she states that her ethnic background is a "mix of British, Danish, Polish, and Russian") female, working as a school counselor at an urban high school. Amy grew up just outside of the city in a middle-class home, and Amy and her two siblings were raised by her mother (a teacher) and father (an accountant). Currently, she lives in the city with her husband and young daughter. Prior to her current job as a school counselor, Amy worked in both the for-profit sector in human resources and later in the administration of the school district where she currently works. Having found these previous work experiences personally unfulfilling, Amy decided to attend graduate school in order to become a school counselor.

Amy has been a school counselor at this high school for the past 2 years. The racially and ethnically diverse school's students primarily come from low-income, immigrant families, and 70% are placed in ESL classes their first years. The administration, teachers, and staff at the school, are predominantly White; there are only one Spanish-speaking counselor and a few Spanish-speaking teachers. In terms of performance, the school is currently on probation for not meeting the state's standards in math, science, and English/language arts. Historically, the school has also had a low-retention rate for African American males and growing truancy among Latino and Asian students.

Oftentimes, counselor education programs and the professional development literature focus on the characteristics of student populations, rather than examine the role of *counselors'* cultural values and worldview. The perceptions of and interactions between Amy and students may vary widely, dependent upon differences in cultural factors and life experiences. In this section, we explore aspects of school counselors' identities and worldviews in a case example and ask a number of questions that may be helpful in reflecting on how these might impact school counseling interactions.

To what extent has Amy examined her White identity and its effects on work with students? How aware is she of White privilege? Amy may be unaware of the powerful influence of Whiteness in her interactions with students. As race is socially constructed and largely based on phenotype (Carter, 1995), Amy's physical appearance (e.g., skin color, hair color and texture, and facial features) may represent various personal, societal, and historical symbols and evoke a wide range of emotions (Kiselica, 1999). For example, to a Black student whose own racial identity development exhibits rejection of White culture and a hypervigilance around issues of race (Helms, 1995), Amy may represent the oppressive White establishment. This student may react to her in a hostile or avoidant manner. Another Black student seeking to assimilate into and to be accepted by White culture may admire and look up to Amy; it is likely that their working alliance would look quite different from that of the previous student.

Amy's White privilege and her middle-class, American background also influence the development of her world-

view and cultural values. As a White woman, Amy may assume a colorblind attitude, believing that all students face the same developmental and academic issues and can overcome any challenges through sheer self-determination. She may overlook the privileges afforded to her in her own experiences. For example, Amy's pursuit of a career in school counseling because of finding her previous work unfulfilling represents a set of privileges she possesses because of her socioeconomic status, education, and White racial status. Though well meaning and optimistic, such a worldview invalidates the very real effects of racism and discrimination for students of color.

More generally, how does Amy attribute student experiences with respect to LOC and LOR? The American value of individualism and the belief that anyone can overcome obstacles if one puts in enough effort represent internal attributions of LOC and LOR, which may obscure systemic, contextual forces at play in student adjustment and academic performance. The systems in which students exist profoundly influence their experiences and academic outcomes; school counselors must consider the students' family systems, the school environments, and the communities as possible factors in addition to internal attributions.

For example, Amy's perceptions of family and concomitant roles and obligations may be in direct conflict with the reality of students who come from more collectivistic cultures (Markus & Kitayama, 1991) and nontraditional families. In Latino families, for instance, relationships with extended family play a major role in one's life; a school counselor from a different culture may overlook the significance of these relationships. Similarly, low-income, immigrant families may expect their children to contribute to the families' incomes by working or acting as caretakers for younger siblings. A student in this situation may exhibit lack of focus in class or increased truancy. Perhaps due to her family's stable, middle-class status, Amy never had to work and her siblings were able to attend daycare while both of her parents worked. Because her worldview does not incorporate the same familial obligations as those of some of her students, Amy may advise these students to abandon those obligations and "stand up to their parents." Alternatively, she may overlook these contextual factors and assume that an individual's performance is due to a lack of motivation or aptitude. Both of these situations assume an internal LOC and LOR. The counselor must balance his or her expectations with the students' cultural norms and realities.

Another systemic factor school counselors should consider is the school environment. What kinds of resources are available? How culturally appropriate are the instructional methods and standards? Do the testing standards represent biased pedagogy or assessment methodology? Applying a strictly individualistic orientation to student issues would place the blame on the student and might overlook a number of barriers that exist in the school setting.

Student experiences should also be considered in light of the community and society. For example, is Amy attuned to the racial dynamics within the school and community? What are the community resources that might be of value to students such as community centers, churches, synagogues, or youth groups catering to different religious or cultural groups? What societal stereotypes, biases, or assumptions does she endorse? With the growing diversity in the United States, increasingly, more students' native languages are not English, and more students live in multilingual homes. How appropriate is a school's system for tracking ESL students? Some school counselors may assume that complete assimilation to English-speaking, American culture should be the goal of immigrants; however, it is imperative to validate students' cultures and provide opportunities for them to explore and take pride in their native cultures.

Amy should also be aware of her endorsement of stereotypes based on gender, race, ethnicity, disability, sexual orientation, and religion/spirituality. For example, Amy may not realize the homogeneity of Asian Americans, often confusing her Asian students with one another and saying, "They all look so similar!" This attitude may hinder authentic relationships with students and a lack of understanding of the variety of issues that face different Asian ethnic groups (e.g., those immigrants that are more recent, that are undocumented, or that have refugee status). She may also endorse the "model minority" stereotype, assuming that all Asians are intelligent, academically successful, and well adjusted. These types of assumptions are just as harmful as negative stereotypes about other racial and ethnic groups, as signs of distress may be overlooked if they are inconsistent with one's assumptions. School counselors may also underestimate students' abilities and resilience if they hold certain negative stereotypes (Coleman, 2007).

While Amy may have a certain degree of awareness about her personal beliefs and expectations of various reference groups, she must also consider what her worldview posits about basic existential issues. What are her expectations about the purpose of life? Amy's definitions of happiness and success in life will likely differ from some of her students' definitions due to their differences in cultural values and worldviews. White, American culture tends to value activity and productivity, while other cultures may emphasize the quality of life in terms of relationships with others, relationships with nature, or spirituality (F. R. Kluckhohn & Strodtbeck, 1961). How does Amy's view of social relations inform her work? What is her temporal orientation, and how does this influence her work with students? For example, the stereotypical American orientation to the future (F. R. Kluckhohn & Strodtbeck) may

influence a school counselor to focus his or her work with students on long-term academic and career goals. However, this may be inappropriate for cultures more oriented toward the present; these students may seek more immediate coping strategies and solutions. Exploration of these larger questions about life and orientation to the world will help the school counselor recognize his or her tendencies and, consequently, recognize and adapt to the preferences of his or her students.

Implications for School Counselor Training

In order to effectively work with students of color, school counselors must understand their own worldviews, cultural values, identities, and White privilege. In particular, one's worldview or LOC and LOR may contribute to one's own interpretation of student concerns and issues. School counselor knowledge and self-awareness is especially influenced by one's understanding of issues concerning acculturation, identity development, and self-making.

The issues raised in this chapter lend themselves to many important implications for school counselor education and training. Specifically, counselor education programs need to address the importance of self-awareness, emotional growth, and introspective development. Because interpretations and interactions associated with school counseling techniques are constructed individually, socially, and culturally, the subjectivity of school counselors' worldviews plays a critical role in school environments. School counselor training should also include critical discussions of individual, institutional, and cultural racism and how counselors' racial identity statuses may contribute to racist counseling interventions.

Pedersen (1994) suggested that (a) cultural knowledge may be gained from an understanding of the institutional barriers in the educational system and in other sociopolitical systems that impact students of color; (b) counselors should have and pursue specific knowledge and information (e.g., history, lifestyles, role of education, socioeconomic background, preferred values, typical behaviors, inherited customs, slang, learning styles, and ways of thinking) about particular cultural groups and teach and share this knowledge with others; and (c) counselors should have information about teaching/learning resources about other cultures and be able to access those resources.

Clearly, it is unrealistic for a school counselor to obtain knowledge about every single student's cultural background. However, school counselors should make every effort not only to learn specific knowledge about students' cultural backgrounds but also to be able to integrate this knowledge into the counseling interactions. For example, it would be important for counselors to ask themselves, "Whose values are reflected in my assumptions about human development and in my counseling techniques?" In terms of knowledge, counselors also need to be cognizant of vast within-group cultural differences and avoid perpetuating stereotypes about groups. Knowledge also extends far beyond historical facts and customs and must include worldviews, perspectives of self, and histories of oppression.

Next Steps for School Counselor Development

As you read the other chapters in this book, which address a wide variety of topics, consider the cultural framework and worldview from which you understand these issues. Furthermore, we cannot emphasize enough that this type of self-exploration and acquisition of knowledge about alternative worldviews is an ongoing process. The following is a list of resources and readings to further enhance school counselor exploration; these should serve as just the starting point for a lifelong journey of reflection and growth.

Diversity and School Counseling

VI

THE ACCULTURATIVE ENVIRONMENT OF SCHOOLS AND THE SCHOOL COUNSELOR: Goals and Roles That Create a Supportive Context for Immigrant Adolescents

EDISON J. TRICKETT AND DIANA FORMOSO

University of Illinois at Chicago

> The core relevant question at the beginning of the new millennium is how we can best incorporate into our society the large number of immigrants who now call the United States their home. Nowhere is the need to responsibly address these issues greater than when it comes to immigrant children. . . . Schooling is at the heart of all these questions.
>
> **(C. Suárez-Orozco & M. Suárez-Orozco, 2001, p. 155)**

The changing demography of public schools in the United States, in recent years, has challenged the existing structure of educational institutions to meet the varying and diverse needs posed by immigrant and refugee students. These students arrive with varied educational histories, including gaps due to political turmoil or war, differing levels of knowledge of English, differing levels of literacy in their languages of origin, limited social capital in terms of parental education and U.S. cultural knowledge, and sometimes histories of traumatic experiences related to their flights from their native countries (Olsen, 1997). They arrive in communities with different kinds of resources to aid the transitions to a new country, and they are placed in schools with many degrees of prior experience and competence in dealing with the cultural and linguistic diversity brought by immigrant and refugee students. Further, new waves or groups are constantly arriving because of turmoil or inadequate economic conditions in the rest of the world.

The challenge to public schools in coping with this changing and diverse influx of newcomers is enormous and is further complicated by the diversity of the immigrant populations themselves. In some locations, specific cultural groups will accumulate in significant numbers to provide a bilingual and bicultural challenge for schools. Here, the primary school task involves how to develop bilingual and bicultural resources relevant to their missions such as bilingual educational offerings, bilingual staffs, and the recruitment of parents from immigrant communities to serve as school–community culture brokers. In other locations, however, multiple groups enter the schools in small numbers, such that a particular school may include children from many countries speaking many languages and bringing with them many cultural histories. Here, the school challenges are somewhat different, focusing on the complex task of developing the kinds of community networks, linguistic resources, and cultural knowledge to understand the lives of the children from multiple cultural contexts. These multiple and contrasting kinds of school contexts suggest that the roles and functions of school counselors will be different depending on their schools' experiences in receiving immigrant student populations.

This chapter focuses on some of the multiple implications of this changing demography for the roles and competencies of school counselors (Bemack & Chung, 2003; Eschenauer & Chen-Hayes, 2005). The notion of school as an acculturative environment is posited as one way of providing a road map for exploring where and how schools can and do affect the educational and psychosocial adaptation of immigrant students and their families. Viewing the

school as an acculturative context can aid school counselors in using their skills and knowledge to affect the success of immigrant and refugee students. In adopting this approach, we suggest that the school counselor role can include not only explicit activities at the individual student level but also those geared toward developing the school as a resourceful and hospitable community for immigrant and refugee students. This perspective draws on emerging calls in the school counselor literature for school counselors to engaging in activities designed to affect school culture more generally (Dollarhide, 2003; Hernandez & Seem, 2004; Ito, 2004; Sink, 2002; Tatar & Bekerman, 2002).

The chapter is organized in the following way. First, we present some of the distinctive issues facing immigrant and refugee students and their parents and discuss why the public school is such a critical setting for them. Next, we provide an ecological perspective underlying the notion of acculturative press and outline some if its implications for schools counselors. Of particular concern here is the value of viewing adolescents, families, and schools as interdependent—that is, of developing an understanding of how students' family lives impact their school behavior and performance as well as how students' school experiences can impact their family lives. We then outline a view of the school as an acculturative environment, emphasizing three central aspects of the schooling experience for immigrant children and their families—the classroom, relationships within the school, and parent involvement. In each section, we address key issues identified by the literature as impacting immigrant children in American schools and some implications for the role of school counselor. The final sections of the paper are dedicated to (a) providing examples of how some schools receiving an influx of immigrant and refugee children have chosen to respond to their needs and (b) discussing possible ways that school counselors can use their existing roles and/or engage in role expansion to attend to the acculturative press in their own schools.

The Multiple Education-Relevant Roles of Public Schools and Immigrant Children and Families

It is customary to think of schools as agents of socialization as well as education; that is, they provide a context for socializing students as well as serving an explicitly educational function through the formal curriculum. Such socialization functions are manifested in the overall school climate, peer group norms, teacher attitudes, and the availability of extracurricular offerings. They are expressed in the creation of such settings as in-school health centers, prenatal programs for pregnant adolescent girls, in-class health modules on AIDS or drugs, and the recent concern with the development of parent involvement programs. There is an assumed and anticipated connection between the educational function of schools and these broader socialization opportunities. For example, proponents of including social/emotional learning in the curriculum do so with the belief that a connection exists between such an emphasis and academic outcomes (Greenberg et al., 2003). Learning about safe sex is seen as a preventive intervention that affects life chances through the demonstrated connection between teen pregnancy, school completion, and future occupational options and economic potential. In engaging in these activities, schools attempt to prepare their students for the world in which they are living, with all its uncertainties, risks, and needed skills.

The role of the school in the lives of immigrant and refugee children, however, extends far beyond these normative educational and socialization functions.

> American public schools since the last century have served as quintessential agencies of acculturation. It is in school settings that immigrant youth come most directly in contact with their native peers—whether as role models or close friends, as distant members of exclusionary cliques, and as sources of discrimination or of peer acceptance. (Portes & Rumbaut, 2001, p. 203)

Thus, for these students, school is the central entry point into the new culture. It represents a setting of both language learning and acculturation. Schools are where immigrant and refugee children learn about the United States and what it means to be an American. It is a site where they receive messages from school personnel—well intended or unintended—about what it means to be an immigrant and a native language speaker and whether they are welcomed here. It is where native-born peers provide information, feedback, and role models for how students in the United States behave toward each other and toward teachers; how friendships are defined and on what basis they are made; and what kinds of aspirations are available for educational attainment in and after high school. The bottom line is that, for this group of students, the school, of necessity, must serve an acculturative as well as an educational function.

Immigrant and refugee children and adolescents share with native-born students hopes for academic school success. Yet they face additional challenges that place them in a potentially precarious position. First, they often do not have the linguistic skills to take full advantage of the offerings of local schools, particularly advanced classes. This issue is particularly complicated for those immigrant

students whose educations have been interrupted in their countries of origin because of war, political upheaval, or rural residence. Thus, the importance of providing intensive language instruction is clear and compelling. In addition, they often either lack or have erroneous knowledge about the culture into which they have entered and the ways that schools function in that culture. These issues range widely, from how to access public transportation and needed services in the community to how to learn what is required from the schools in terms of dress, supplies, schedules, and teacher conferences. While these aspects of daily school life are taken for granted by native-born children and their families, they represent new learning for many immigrants. Indeed, considerable research suggests that these students often do not understand how schools operate, ranging from such basic knowledge as how to use lockers to how to relate to teachers and American peers, and do not understand the role of guidance counselors, the idea of scholarships for post-high-school education, and for undocumented immigrants, legal rights and reporting responsibilities of school personnel (Lucas, 1997; Portes & Rumbaut, 2001; C. Suárez-Orozco & Suárez-Orozco, 2001).

The school can serve an equally important role for parents through its structure, policies, and activities. Although children need guidance in their adaptation to U.S. culture and schools, parents often are unable to provide such guidance based on their own recent arrivals and limited language skills. Parents also may have no one to turn to for advice on guiding this process if their support networks consist mainly of family members and friends who have recently immigrated and if they live and work within ethnic enclaves that give them little exposure to native-born parents or coethnic parents with longer tenure in the United States. If parents are to support the educational progress of their children, they need to learn about the culture of schools as well as the culture of their new country. For many immigrant and refugee parents, schools may be the only available resource in terms of getting the information and support they need to assist their children effectively. Thus, the school experience is critical not only for immigrant children but for their families as well. When schools do not provide a welcoming and supportive port of entry for immigrant parents as well as children, immigrant students' educational prospects and life chances are impacted. Thus, the school is both an educational and acculturative setting of great significance to immigrant families.

Ecology and the Acculturative Press

In elaborating the implication of the changing school demography for the role of school counselor, two primary points are central to the remainder of the chapter. The first is the importance of ecology, of understanding the changing social and cultural context of the school and the students and parents it serves. Elsewhere, Trickett (e.g., Birman, Trickett, & Buchanan, 2005; Trickett, 1991; Trickett & Birman, 1989; Trickett, Kelly, & Todd, 1972; Trickett & Schmid, 1993) has written about the implications of an ecological perspective for understanding the school context and interventions in it. An ecological perspective suggests that both schools and students will continue to struggle unless interventions are based on a rich and thorough understanding of the issues facing both schools and students. Both schools and families will benefit when institutional agents take charge of learning about these issues and translating that knowledge into ways of making the school context as welcoming a reception for immigrant students as possible. This mind-set frames the potential for the school counselor as such a resource.

The second point stems from this ecological perspective on the ever-changing school contexts of today. In these often fluid contexts, it is useful to view any specific intervention effort from a "learning how to learn" perspective. This is important because the landscape of immigration can change rapidly depending on events around the world, and the ecology of schools changes over time in both numbers and diversity of immigrant populations. In this ecological context, what is adaptive for school personnel is the ability and energy to invest in self-education about how lives of students and parents from multiple cultures and contexts may affect students' school adaptations and performances. A learning how to learn perspective is critical because every school is different and because the immigrant wave it receives this year may be very different from the immigrant wave that arrives next year. Some of the issues described in this chapter will be present in a particular school, whereas others will not, and some (when present) may already be effectively addressed. Many issues will impact immigrant students from some countries, but not others. Finally, there will undoubtedly be issues present in schools that are not yet addressed in the literature on immigrant families or the school counseling literature. The distinctive positioning of school counselors at the interface of students' academic and social needs, as well as their access to teachers, parents, and students, renders them potential boundary spanners who can both seek out and communicate to relevant others information about the issues facing immigrant and refugee children and families.

Thus, the ecological perspective provides contours for conceptualizing the school context, while learning how to learn provides a mind-set for constructive engagement with the process of facing diversity in the present and a changing future. Such a perspective is intended to bring into sharp relief the needs and issues of immigrant and

refugee children and families and to place them in a central position with respect to the counselor role.

One Example of an Ecological Mind-Set: The Interdependence Between Adolescent School Experiences and Family Lives

An ecological perspective suggests that schools, families, and students operate interdependently, with each system impacting and being impacted by every other (Bronfenbrenner, 1977; Trickett, Kelly, & Todd, 1972). In efforts to make a positive difference in the school lives of immigrant and refugee children, it is useful to understand how the family lives of both parents and students can spill over into the school experience, as well as how students' school experiences can spill over into their well-being and family lives. Two implications of this interdependence are cited here: (a) the ecology of family lives and school behavior/performance and (b) culture brokering, the acculturation gap, and school behavior/performance.

Ecology of Immigrant Family Lives

At its most general level, an ecological perspective draws attention to the circumstances and challenges facing immigrant and refugee families in their transitions to new lives. C. Suárez-Orozco and Suárez-Orozco (2001) provided a useful overview of many relevant issues in this regard. First, they found that only 20% of Mexican immigrant children in their sample came to the United States as part of a family. Thus, when immigrant children who were separated from parents went to school every day, they brought with them their worries around separation, loss, and family reunification.

When intact families do arrive in the United States, however, parents are busy with the tasks of finding work, housing, and transportation and, indeed, of enrolling their children in school, often without the benefit of English-language proficiency or the knowledge of how one goes about school enrollment in the United States. Undocumented immigrant families face additional challenges as they try to fill these important needs while avoiding detection, and many refugee families must simultaneously deal with the emotional consequences of having experienced war-related violence or political persecution. If and when jobs are found, the nature of the work (e.g., long hours and evening shifts) presents additional challenges for immigrant parents. These challenges permeate every aspect of immigrant parents' and children's lives and are not easily set aside for the purposes of engaging in or interacting with the school. Thus, learning about the ecology of the lives of these families is critical in understanding the school-related challenges of their children.

Culture Brokering, the Acculturation Gap, and School Behavior/Performance

The research literature suggests that immigrant students often play a number of important roles in their families that affect both their school performance and family dynamics as well, such as working to alleviate economic hardship and caring for younger siblings (Orellana, 2003). Two specific issues, however, have received considerable attention. The first involves the culture broker role played at one time or another by almost all immigrant children (Portes & Rumbaut, 2001). Here, children mediate between their families and external institutions such as schools through serving as translators, attending doctors' appointments and parent–teacher conferences, or otherwise helping parents negotiate complicated U.S. systems (Orellana, Dorner, & Pulido, 2003; Portes & Rumbaut, 2001; Trickett & Jones, 2007). While this role may be viewed as an unfair burden on children or a valuable opportunity for them to learn through experience, entering into these necessary activities can limit students' time to complete homework or participate in school activities.

The acculturation gap (Birman, in press; Portes & Rumbaut, 2001) is seen as resulting from the differential rates of acculturation of parents and children to the new culture. School is the primary setting for this to occur, as parents see their children becoming more Americanized than they are in terms of language acquisition, cultural values, and behavior, including choices of clothing and music. The acculturation gap may also be influenced as children fail to retain aspects of the culture of origin that are important to parents. The often cited parental fear of "losing one's child to the new culture" reflects both of these concerns and may contribute to family disagreements about various school-related involvements for their children. Because of their salience in the lives of immigrant students and families, the culture broker role and acculturation gap represent salient issues that can affect the family/student/school interdependence.

Of particular import here is the acculturation gap with respect to acquisition of a new language and retention of the language of the culture of origin. In one of the most broad-based studies of immigrant adolescents and families, Portes and Rumbaut (2001) followed over 5,000 second-generation immigrant students from 77 countries for a 3-year period (14–17 years old). Their findings are too numerous to cite here, but several are central to the interdependence of families, students, and schools. For example, they found that over 98% of these adolescent immigrants report speaking English well or very well, and

while 90% also report speaking another language, the fluency level is significantly less. In addition, their data suggest that the acquisition of English is accompanied by a loss of native language, which results in an acculturation gap between children and their parents, who are less likely to have acquired English. Furthermore, they stressed that because language fluency does not simply involve the acquisition of a new skill but implies a broader sense of identification with the new culture (and perhaps a reduced sense of identification with the culture of origin), this pattern reinforces parental concern over losing their children to the new culture.

There are multiple implications of these findings for the interdependence of school and family life. Portes and Rumbaut (2001) demonstrated a link between such dissonant parent–child linguistic acculturation (an acculturation gap) and increased parent–adolescent conflict and decreased family cohesion and parent–child communication. Moreover, dissonant acculturation is associated with several child outcomes, including lowered self-esteem, increased family conflict, and grades in school. The loss of students' native languages can also disconnect them from the potential protective influence provided by extended families and coethnic community members and peers (see also C. Suárez-Orozco & Suárez-Orozco, 2001).

Portes and Rumbaut (2001) argued that limited bilingualism and its negative outcomes for youth and their families are "partly traceable to the inability of public schools to support immigrants' efforts to preserve their language" (pp. 145–146). Their recommendation with respect to literacy is twofold: First, bilingual education should focus on both the teaching of English and the retention of native language, not simply the former. Here, the notion is that while teaching English to immigrant children and youth is clearly a first priority of schools, its success may inadvertently heighten distance between children and parents and have deleterious consequences for both family life and school performance. Second, they recommended that efforts be made to increase parental fluency in English. This effort may both support positive family relationships by reducing the acculturation gap and help parents negotiate the educational system and bolster their children's school performances.

A focus on the ecology of immigrant lives and such issues as the culture broker role and acculturation gap can provide not only an appreciation of the challenges facing these students and families but also ideas for intervention. Such an understanding can be a resource as the school counselor interacts with other school personnel who lack such specific knowledge.

In addition, as one of the first major contacts that newly arrived immigrant students and families encounter, counselors are well-positioned to assist them in their transitions to American public schools (Williams & Butler, 2003). At the student level, varied potential roles have been described, including developing a set of coordinated and comprehensive strategies that focus on orientation and facilitating the acculturative process for newcomer students (e.g., Shepherd-Johnson, 1995). Elsewhere, these efforts have included orientations to the school and U.S. culture, adult or peer mentoring, Newcomer Clubs, conflict resolution and peer mediation programs, small group counseling, classroom guidance (Shepherd-Johnson), or indeed, the creation of Newcomer Centers or Newcomer Schools (e.g., Olsen, 1997). At the family level, efforts to link immigrant families with community agencies or supports that can help them to negotiate the transition to the United States have also been described as potentially beneficial (Taylor & Adelman, 2000).

The Acculturative Environment of Schools: An Ecological Overview

The Acculturative Press

Sarason's (1982) classic treatise on the culture of the school and the problem of change underscores the perspective that school counselors operate within a school culture that affects not only the lives of immigrant students but also what counselors can themselves accomplish (see Tatar & Bekerman, 2002). To sharpen the focus on the school as an acculturative environment for immigrant students, we employ the notion of acculturative press. This concept draws on the more general notion of environmental press derived from the early work of Murray (1938) and flows from Lewin's (1951) suggestion that individual behavior is a function of person and environment. Murray described the environmental press in terms of its resources, norms, and constraints that formed the context within which individuals function. Individuals, on the other hand, could be described in terms of needs that may or may not mesh with the environmental press. Thus, just as individuals differ in terms of their preference for nurturance and order, so may environments differ in the degree to which they may be viewed as nurturing or orderly. The acculturative press adopts this notion of fit as it relates to the ways in which the social context of the school supports, ignores, or inhibits the academic, social, and acculturative demands facing immigrant and refugee children and their families.

The notion of acculturative press is foreshadowed by Gordon (1964) in his classic book *Assimilation in American Life*. He distinguished three main historical philosophies or goal-systems of assimilation evident over time: "Anglo-conformity," "the melting pot," and "cultural pluralism." Anglo-conformity requires renunciation of culture

of origin in favor of values and behavior of Anglo-Saxon core group. The melting pot envisions a new integration, a sociobiological merger, and creation of a new indigenous American type. Cultural pluralism postulates preservation of communal life and significant aspects of the culture of origin within the context of American citizenship and social and political integration into American society. While not pure types, these broad characterizations suggest different potential structures and processes in schools which, taken together, suggest to immigrant students how the school views the goals of their acculturation in a new land.

Levels of the Ecological Context and the Acculturative Press

While Gordon's (1964) typology provides a useful orienting set of ideas, specifics of the acculturative press are found in multiple levels of the ecological environment of the school (Bronfenbrenner, 1979; Trickett et al., 1972; Trickett & Schmidt, 1993). For purposes of this chapter, we are selecting three different aspects of the school representative of the acculturative press and relevant to existing and potential roles of school counselors. They include (a) the classroom, (b) out-of-class relationships with peers and school adults, and (c) opportunities for parent–school interactions. Each of these domains is reviewed for its relevance to the acculturative press and its implications for the educational and acculturative development of immigrant adolescents.

The Classroom as an Acculturative Context. The way immigrant children experience schools, particularly at the elementary school level, is greatly influenced by their classroom experiences. Although school counselors are not classroom teachers, counselors could play an important role in shaping immigrant students' experience in schools by learning about classroom issues at their school, facilitating conversations with teachers, counseling colleagues in anticipation of the issues facing immigrant students, and serving in a professional development capacity for those serving immigrant students. This potential role is supported by calls in the school counselor literature for a more central place for counselors in the professional development of teachers (Esquivel & Keitel, 1990) and increased communication and support among counselors, classroom teachers, and ESL teachers (e.g., Clemente & Collison, 2000). This section outlines key themes identified by the research literature as relevant to immigrant students' classroom experiences that provide examples of the kinds of issues school counselors may potentially affect at the classroom level.

Teacher attitudes and behavior. While a warm, respectful teacher–student relationship is a powerful protective resource for all students, it is particularly so for immigrant students (e.g., Stanton-Salazar, 2001). A focus on the classroom as an acculturative context directs attention to specific aspects of the classroom that contribute to creating such a context. C. Suárez-Orozco and M. Suárez-Orozco (2001), for example, found that many teachers who worked closely with immigrant students regarded them highly, whereas others viewed them as lazy, less intelligent, prone to get into trouble, and unlikely to assimilate or succeed. Classroom climate for immigrant students also is impacted by the extent to which teachers are knowledgeable about and inclusive of students' native cultures and languages in ongoing classroom processes, assignments, and classroom displays. In some schools, teachers have tied the curriculum to immigrant students' real life experiences (e.g., using immigration rates in math examples) in order to make lessons meaningful and to communicate an ethic of inclusion (Lucas, 1997). Such signs are noticed by students, and their absence seen by them as sending messages about the relevance or value of their cultures of origin (Olsen, 1997).

Similarly, conversations around students' native language use in schools can convey messages of inclusion or exclusion. Teachers have been found to interpret immigrant students' native language usage in many diverse ways, including as an endorsement of ethnic pride, a refusal to assimilate, an opportunity to speak unfavorably about teachers, or a lack of motivation to learn English (see Birman, 1998). Children with a short tenure in the United States are sometimes simply expressing themselves in the only language they speak. Nonetheless, these interpretations will inevitably shape how teachers respond to native language use, and teacher responses will convey information to immigrant students about what it means to be an American and what it will take for the doors to American schools to be open to them.

Gordon's (1964) images of Anglo-conformity, the melting pot, and cultural pluralism as contrasting acculturative goals are evident in the classroom through teacher attitudes and behavior regarding the cultural background of the students. Counselor-led discussions and classroom consultation around multicultural issues such as those raised previously may encourage teachers to develop a curriculum that is inclusive and respectful of diverse cultures and languages, which can go far toward helping immigrant students feel valued and welcome. Durodoye (1998) and Shepherd-Johnson (1995) outlined school counseling models used to foster such multicultural awareness among teachers.

Academic press. Academic press refers to the extent to which teachers provide exposure to advanced course work and closely link student performance and grades. Boyd and Shouse (1997) argued that for low-SES schools, emotional climate and academic press go hand-in-hand to improve

student outcomes. In their study, the least academically effective schools were those that combined a supportive emotional climate and weak academic press, leading the authors to caution against viewing "positive social relations and student self-esteem as reasonable substitutes for meaningful academic demand and student effort" (p. 148). Teachers serving immigrant students are often faced with striking a delicate balance between accommodating the barriers some immigrant students bring to the classroom and maintaining an ethic of high expectations for student effort and success. Critical to this tension is the domain of academic expectations (Weinstein, 2002) teachers hold for immigrant students, particularly those entering school later or arriving with disrupted educational backgrounds. In addition, the lack of readily available diagnostic tools to differentiate linguistic issues from cognitive impairment complicates the situation. In this context, school counselors may be in a useful position to work with teachers around expectation issues and encourage them to translate their concern for the well-being of immigrant students into additional supports for learning instead of lowered expectations. Although concern for immigrant students and respect for their cultures and languages are important, they are not reasonable substitutes for high expectations and academic support.

Course placement and bilingual education. While the previous discussion focused on students already placed in classes, a critical role played by counselors in many schools is in course placement. As such, counselors serve as gatekeepers for classes and post–high-school options (Lucas, 1997). These placement decisions are determining for many immigrant students, as they affect the kind of acculturative classroom climate they will experience, the degree to which the classes count toward graduation, and the degree to which they will be tracked. Course placement decisions are complicated by what immigrant students themselves bring to the school: What was their schooling experience in their home country? Did they experience interrupted education? What is their level of English proficiency? What are their academic competencies and could these be masked by interrupted education or a lack of English proficiency? Like native-born students, immigrant students bring great diversity in terms of history, talent, and work ethic. Although the diversity among immigrant students should be considered when making course placement decisions, individualized assessments can be difficult and time consuming, particularly for counselors responsible for hundreds of students. Furthermore, assessment tools (when they exist) may not be valid for English-language learners (ELL) or may not generalize across countries.

Under these circumstances, school counselors are themselves often placed in difficult situations with few clear available and positive options. When faced with a rapid influx of immigrant students, students who share a common heritage or language may be assigned to the same classes, irrespective of their individual abilities or school experiences. To illustrate, interviews with school counselors revealed that there was no systematic plan in many schools to identify gifted students in ESL groups using bilingual assessment methods (Clemente & Collison, 2000).

These decisions are further complicated by what the school has to offer in terms of courses for immigrant students: What are the options for students in terms of general education courses, vocational training, or college prep classes? Which teachers are known to be committed to the education of immigrant students? Can incoming immigrant students be grouped together in common classes? Should they be? Unfortunately, while immigrant students are working to learn English, they are often enrolled in classes with shallow course content that does not adequately prepare them for classes that are more academically demanding and in classes that can essentially exclude them from the college track (C. Suárez-Orozco & Suárez-Orozco, 2001). Indeed, many ELL are "mainstreamed" into vocational education, lower academic tracks, and remedial courses (see Harklau, 1994a, 1994b) based on their English proficiency rather than on their academic competencies. This creates a dilemma for counselors who want to see immigrant students do well academically, but at the same time feel constrained by students' educational and linguistic limitations. Similarly, concerned counselors and teachers may wonder if it is fair to expect immigrant students to effectively participate in a challenging curriculum while they are facing multiple transitions and struggling to learn English. Although one solution is to place students in less challenging courses, some argue that all immigrant students can be exposed to the same high expectations and challenging curriculum and instead have access to varying levels of academic support (see Lucas, 1997; Mehan, Villanueva, Hubbard, & Lintz, 1996; Olsen, 1997).

In sum, course placement decisions for immigrant youth can have widespread implications for their English-language learning, native language fluency, academic performance, peer networks, and future life options. These decisions should be taken particularly seriously when working with immigrant students because family members or immigrant peers often do not understand the school system well enough to offer helpful guidance (McCall-Perez, 2000). Here is an area in which the school counselor can exert considerable control as he or she thinks broadly about child outcomes when making decisions around course placement and English-language learning. Another vital role for school counselors is to look beyond their particular school's policies around course placement for approaches and programs that have demonstrated success elsewhere,

evaluate their potential for success in their own particular school context, and advocate for use of alternative strategies and the recruitment of qualified bilingual staff, if necessary. In support of this latter role, McCall-Perez concluded, "[I]n periods of challenges to the educational rights of immigrant and language minority students, informed counselors can serve as their most effective advocates and protectors" (p. 19).

Out-of-Class Relationships With Peers and School Adults. In addition to the classroom as an acculturative context, the acculturative press is found outside of the classroom in the extent and nature of relationships of immigrant and refugee students with both peers and school adults. Both peer relationships and adult connections have been highlighted in the literature, with quite differing emphases, and both have implications for the educational and psychological adaptation of immigrant and refugee students and the potential role of the school counselor in that process.

Peers and the acculturative press. Many qualitative studies of the school lives of immigrant children and adolescents have documented the stressors, challenges, opportunities, and school outcomes related to out-of-class interactions with peers and school adults (Portes & Rumbaut, 2001; C. Suárez-Orozco & Suárez-Orozco, 2001; Stanton-Salazar, 2001). Central to all of these accounts are encounters with perceived discrimination from both peers and adults. Anecdotal accounts include overhearing anti-immigrant sentiments in the casual conversations of teachers (C. Suárez-Orozco & Suárez-Orozco), ethnic slurs directed at students by peers (Portes & Rumbaut, 2001), and being asked ignorant and sometimes insulting questions about one's country of origin by both peers and adults (Birman, Trickett, & Bacchus, 2002).

Such accounts are substantiated by quantitative data derived from large-scale studies where immigrant adolescents have been asked about the nature and frequency of discrimination experience in schools. For example, Zhou (2001), in a sample of Vietnamese adolescents in San Diego followed over a 3-year period, found that 65% at Time 1 and 72% at Time 2 reported being discriminated against in school. The most common source was native-born students, both Black and White (38% and 41% overall at the two time periods, 3 years apart), but school adults were also mentioned, particularly teachers (17.5% and 29% at the two time periods) and school counselors (6% and 14%).

As Portes and Rumbaut (2001) suggested, race may be a paramount factor in the social context of reception for immigrant students and account for perceived discrimination. However, the experience of discrimination is not reserved for immigrants of color. Birman, Trickett, and Buchanan (2005), for example, sampled two groups of immigrant adolescents from the former Soviet Union living in different community contexts, one ethnically dispersed and one of high ethnic concentration. Of the adolescents, 90% in the Concentrated Community and 73% in the Dispersed Community reported experiencing at least one incident of discrimination in the school context within the previous month. Again, the sources of these perceptions were both other students and teachers.

However, peers can also be a source of support and access to the dominant culture and can provide social norms supportive of academic achievement and social integration. Indeed, a potentially important point of intervention may be in facilitating supportive peer relationships among newcomers and between newcomers and immigrant youth with longer tenure in the United States or native-born peers. For example, Conchas (2001) described an in-school academy within a larger school where Latino students reported feeling close bonds with one another and formed relationships with both Latino and non-Latino youth. Peer relationships were sources of both academic and social support, and students noted that school personnel played a key role in encouraging a sense of community.

School adults and the acculturative press. School adults, while clearly seen as a source of discrimination and as part of the problem, are also a potentially large part of the solution. One potential source of social capital for immigrant and refugee students in the out-of-class context involves the extent and nature of the connections they make with adults in the school: teachers, guidance counselors, administrative staff, and coaches. If there is any unanimity in the recent scholarly books describing the lives of immigrant children and adolescents in the context of the school, it is this point. As M. Suárez-Orozco (2001) pointed out, many immigrant students live in neighborhoods with schools characterized by a culture of violence, little social capital, overcrowded classrooms, and outdated texts. School adults offer the potential to be personally supportive prosocial models and can serve as advocates for immigrant students when their parents are often not knowledgeable about how to perform such functions. Stanton-Salazar and Dornbusch (1995) suggested that such "supportive ties with institutional agents represent a necessary condition for engagement and advancement in the educational system and, ultimately, for success in the occupational structure" (p. 117). Such connections can link immigrant students to other resources that can increase their social capital: college or job connections, scholarship opportunities, or school organizations previously unaware of the skills and competencies of immigrant students.

While many scholars and immigrants themselves have commented on the importance of a particular adult or small number of adults as relating to their eventual school

success, Stanton-Salazar's (2001) beautifully written book *Manufacturing Hope and Despair: The School and Kin Support Networks of U.S. Mexican Youth* articulates some of the dynamics and processes that make school adults so important. His focus is on the role of supportive networks and help-seeking experiences of lower income, Mexican American youth in school. In addition to focusing on structural aspects of the school experience that constrain the development of networks with school adults, Stanton-Salazar used the concept of network orientation to describe how Mexican youth decide to approach or not approach school adults for support, advice, or guidance. Confidence or trust that adults are indeed interested is central here. His book is a provocative and compelling look at the ecology of schooling for these immigrant youth and the potentially protective web that caring school adults can help immigrant youth establish. In Stanton-Salazar's work, teachers and guidance counselors surface as important parts of the social networks of these immigrant students and often serve as coparents, informal mentors, child advocates, and informal psychologists. He suggested that intervention efforts in the school need to be assessed in terms of how well they open up the kinds of relationships and access to institutional resources needed by these students.

There are many reasons, however, why such critical relationships are difficult to achieve. These reasons range from the structural (e.g., lack of teacher time to develop such relationships) to the normative (perceived discrimination or lack of interest on the part of school adults). Interviews with Latino youth reveal that the lack of bilingual counselors can not only prohibit outright counselor–student communication in the case of monolingual Spanish speakers, but also serve as a barrier for bilingual students who find it difficult to discuss stressful situations or strong emotions in English (Clemente & Collison, 2000). Regardless of the many very real constraints, school adults can provide a potential safe haven for immigrant students as well as a link to other school resources of relevance to their adaptation both educationally and acculturatively (Portes & Rumbaut, 2001; C. Suárez-Orozco & Suárez-Orozco, 2001).

In sum, the out-of-class relationships formed by immigrant and refugee students with peer and school adults represent a critical part of the acculturative press of schools that influence their immediate options and longer term life changes. The school counselor role is not only central to supporting immigrant students in dealing with the structural issues in schools that inhibit making adult connections or yield identity-disconfirming experiences. It can serve as a springboard for school culture and intergroup assessment and intervention.

Parent Involvement. The acculturative environment of schools also encompasses the ways in which immigrant parents are included in or marginalized by the school. Parent involvement in children's education is consistently identified as a critical protective resource for children's school success (Eccles & Harold, 1993; Epstein, 1991; Hess & Holloway, 1984; U.S. Department of Education, 1994) across family income, education, ethnicity, and immigrant status (e.g., Birman & Ryerson-Espino, in press; Delgado-Gaitan, 1991; Epstein & Becker, 1982; Hao & Bonstead-Bruns, 1998; Mau, 1997). When parents provide for children's basic needs, support their education at home, and maintain communication with the school, their involvement can offset the negative impact of poverty and prevent high school drop out (Chrispeels & Rivero, 2001). This section reviews the considerable constraints experienced by immigrant parents that unfortunately can impede meaningful parent involvement.

Sociocultural constraints on immigrant parents. There are multiple reasons for the relative lack of immigrant parent involvement in the ongoing, everyday education of their children. Lack of adequate knowledge of English and, sometimes, lack literacy skills in their native languages are oft-cited by immigrant parents as primary barriers to traditional forms of parent involvement, including helping with homework, reading with children, and participating in school activities (Collignon, Men, & Tan, 2001; Delgado-Gaitan, 1991). They can have devastating effects on immigrant parents' perceived competence to helping support their children's education and can lead to disengagement from parent involvement activities more generally (e.g., Delgado-Gaitan, 1992; Hoover-Dempsey & Sandler, 1997). Thus, counselor efforts to develop and adapt parent involvement strategies that do not require formal education or English-language literacy, but may nonetheless support children's educational goals (e.g., discussions about the importance of education) can serve to increase parent self-efficacy and bolster student engagement.

In addition, as previously described, the tasks of resettling in a new country are multiple and complex, and the process of immigration and the existence of competing demands for time and resources can impede immigrant parents' availability to be more involved in children's schooling (C. Suárez-Orozco & M. Suárez-Orozco, 2001). Moreover, many immigrant families come from countries where parents were not expected to be involved in their children's education (Birman & Ryerson-Espino, in press; C. Suárez-Orozco & M. Suárez-Orozco, 2001; Trueba & Delgado-Gaitan, 1988). These experiences continue to shape parents' understanding of their sense of place in their children's education in the United States (Chrispeels & Rivero, 2001; Hoover-Dempsey & Sandler, 1997).

School constraints. Parent involvement depends, in large part, on the extent to which the school can provide

accessible opportunities for parents to learn about the nature of schooling and the roles they can play (Chrispeels & Rivero, 2001; Hoover-Dempsey & Sandler, 1997). Delgado-Gaitan (1991) found that many traditional avenues for involving parents in schools were closed to immigrant parents because school-generated processes for parent involvement relied on specific cultural knowledge in order to participate effectively. She argued,

> Schools facilitate the exclusion of students and parents by (consciously or unconsciously) establishing activities that require specific majority culturally based knowledge and behaviors about the school as an institution. Frequently, these ideas are assumed and are not made explicit. The absence of appropriate sociocultural knowledge precludes acceptable participation in formal school activities, resulting in isolation for many parents, especially those who have not been schooled in the United States or are limited in English proficiency. (p. 21)

To best support their children's education, immigrant parents need information about the local school system, grades and graduation requirements, the school's approach to bilingual education and how decisions about class placement are made, how difficulties in school adjustment and behavior problems are handled, and expectations for students and parents in terms of their interactions with the school. To the extent that school counselors make this information available to immigrant parents through individual contact, group meetings, or initiating workshops, it can reduce a primary barrier to parent involvement and immigrant students' academic success (e.g., Birman & Ryerson-Espino, in press).

In addition to information about school practices, policies, and procedures, the availability of school personnel who can communicate in parents' native language or serve as cultural brokers affects the degree of immigrant parent involvement, particularly for parents with limited English proficiency or cultural differences. Available bicultural and bilingual school personnel are a tremendous resource for schools whose immigrant student body shares a common heritage and language. For schools where immigrant students come from many countries speaking many different languages, one approach is to identify school personnel or community members who can serve as liaisons, translators, and cultural brokers for parents and the school. This networking strategy has been used with some success in a variety of parent involvement efforts (e.g., see Chrispeels & Rivero, 2001; Delgado-Gaitan, 1991; Epstein & Becker, 1982), although the level of success depends largely on the level of training and support for this role (e.g., Epstein & Becker). Additional efforts have included school counselors hiring and supervising bicultural and bilingual home–school liaisons to serve in various roles that normally were part of a counselor's job (Clemente & Collison, 2000) and to serve as cultural consultants (Esquivel & Keitel, 1990). Thus, bicultural, bilingual school personnel or parent liaisons may prove to be an invaluable resource to both parents and schools, and counselor efforts to recruit and train such personnel or advocate for creating such a position may bolster parent involvement and facilitate the work of school counselors. (While immigrant students are sometimes recruited for some of these translational roles, translating or transmitting complex information from schools can place them in a difficult and stressful position, particularly when they themselves misunderstand such information or they may be invested in portraying their school performance in a more favorable light.)

In addition, school personnel have been found to differ from immigrant parents in their understandings of the extent of parent involvement and why some immigrant parents are not more involved (Olsen, 1997). Because they may not see immigrant parents at school as often as their native-born counterparts, school personnel may perceive immigrant parents as disinterested and uninvolved in their children's education (Collignon et al., 2001; Moll, 1992). Similarly, teachers working in low-income, urban schools reported that most parents were not involved in their child's education, did not want to be more involved, and were not capable of high-quality involvement (Becker & Epstein, 1982; Epstein, 1991).

These perceptions are in stark contrast to those of immigrant parents, who cite better educational opportunities for their children in the United States as a primary factor motivating their migration (C. Suárez-Orozco & Suárez-Orozco, 2001). Indeed, parents in the same low-income, urban schools referred to earlier (Becker & Epstein, 1982; Epstein, 1991) reported that they supported their children's education at home, but needed better information from teachers about what types of educational support to provide. This reflects a broader concern reported in the literature that immigrant parents value education but are unsure about how to proceed (Delgado-Gaitan, 1992; C. Suárez-Orozco & Suárez-Orozco). These important differences in how teachers view parents and how parents view themselves create additional barriers to successful parent involvement and are likely an important discussion point among counselors, teachers, and parents.

Several excellent reviews offer recommendations for parent involvement strategies (Becker & Epstein, 1982; Chrispeels & Rivero, 2001; Delgado-Gaitan, 1991, 1992; Epstein, 1991; Lucas, 1997), but few were developed with specific immigrant parents in mind and none directed toward schools whose student population reflects multiple cultures and languages. Armed with rich understandings of barriers to parent involvement, counselors are better posi-

tioned to adapt strategies to the needs of the group, incorporate parents' strengths in meaningful ways, and render parental limitations less limiting. From a learning how to learn perspective, school counselors could fill a number of roles, including learning about the barriers and facilitators of parent involvement for immigrant families, developing and adapting parent involvement strategies tailored to the needs of immigrant parents and the teachers who serve them, and identifying areas of misunderstanding and facilitating conversations and professional education around the issues at hand. The school counselor literature discusses methods for strengthening family–teacher–counselor connections (e.g., Amatea, Daniels, Bringman, & Vandiver, 2004) and creating school–community links (Taylor & Adelman, 2000) to facilitate parent involvement and student success. In addition, strategies for networking with relevant external agencies can enhance the resource pool for immigrant parents and school alike (Lucas, 1997).

Attending to the Acculturative Press: Reports From the Field

In discussing the potential school counselor role, it is useful to provide select examples of how the acculturative press of schools has been attended to in terms of both empirical research reports and case studies describing schools or programs within schools which have this focus. With respect to empirical reports, for example, Rich, Ben Ari, Mar, and Eliassy (1996) provided data from Israel on schools dealing with significant numbers of immigrants from the former Soviet Union. Their focus is on how to characterize those schools doing an effective job of integrating immigrant children into the ongoing workings of the school. In addressing this issue, they made clear that, for immigrant students, the school task includes not only academic but also social goals, in this instance, social integration into the school.

Through a combination of student and teacher quantitative data and interviews with senior school officials, Rich et al. (1996) assessed varied aspects of the school climate and school structure. Using self-report data from immigrant students on perceived teacher support and native-born student acceptance and inclusion, they divided schools into effective and ineffective in their responses to immigrant students. Effective schools were more likely to have a specific adult in the school responsible for the welfare of immigrant students, were more likely to integrate newcomers into existing classes rather than using pullout programs extensively, provided additional tutorial opportunities and work for immigrant students beyond regular classroom programming, and were led by principals who viewed their job with immigrant children as more encompassing and personal rather than one focusing primarily on academic goals. In addition, elementary school (grades 1–6 or 1–8) were more effective in integrating immigrant students than junior high schools (grades 7–9), suggesting somewhat different issues related to school climate and structure at these different levels.

Additional on-the-ground data come from reports of programs within schools designed to improve the acculturation and adaptation of immigrant students. For example, Mehan et al. (1996) investigated features of a particular program, the Medical Academy, which made schoolwork for a mixed group that included Latino immigrants. The goal was to restructure the school environment to promote academic engagement in the context of a school culture that was stratified by race and differential opportunities. Here, the key was the social scaffolding of institutional support systems, "the practice of combining heterogeneous grouping with a uniform, academically rigorous curriculum enhanced with strong supports" (p. 78). Reflecting the importance for immigrant students of learning about the culture of the school, the program "explicitly teach[es] aspects of the implicit culture of the classroom and hidden curriculum of the school" (p. 81).

This report outlines a litany of issues facing immigrant students that contributed to or reflected their marginalization in the school (Mehan et al., 1996). These included the effects of tracking, socialization patterns at school, and sitting together at lunch and in classes; stigma associated with lower track classes; perceived ignoring by guidance counselors; little contact with institutional agents; and the perceived unavailability of caring teachers.

The Medical Academy program was self-consciously designed to reflect an alternative context to the marginalization just described (Mehan et al., 1996). The Medical Academy model included enhanced institutional supports for students, including an advanced, challenging curriculum, support for an academically oriented peer network, tutors, and workshop-based academic support. These specific efforts were largely lacking in the general education track at the school. In the smaller Medical Academy, every teacher knew each student by name, teachers met regularly as a group to discuss ways of doing better, and there was frequent contact between school and home. In addition, a student peer educator program linked program students with other students, community members, and parents, and career mentors were available. Taken together, these efforts are described as creating a strong sense of community and resultant commitment to school and learning.

This program demonstrated a 93% graduation rate, with 98% of graduates enrolling in college, supporting the notion that high academic press and school-level institutional supports can help at-risk students succeed (Mehan et al., 1996). In addition, the racial and ethnic diversity

of the program in the context of a safe and supportive program environment encouraged intergroup contact, with friendships and dating occurring across cultural boundaries. Taken together, these findings suggest a potentially important role for school counselors in helping schools to examine their policies and practices with respect to the provision of academically challenging classes and appropriate placement of immigrant students in those classes as well as availability of academic supports for immigrant youth. They also suggest the importance of considering how course placement options facilitate or constrain opportunities for intergroup contact.

Immigrant students' first placements in their schools are typically not their last, and the difficult transition to mainstream classes from Newcomer Centers or ESL/bilingual programs represents another potential intervention point. Lucas (1997) recommended that one person be responsible for coordinating these transitions, and school counselors are well positioned to oversee this process. This role could entail (a) planning a gradual transition that slowly reduces the number of ESL/bilingual classes and adds mainstream courses; (b) arranging for additional, ongoing supports, such as tutoring, bicultural/bilingual instructional assistants, and mentoring; and (c) monitoring the transition process for each student.

In addition to programs within schools, Newcomer Schools (e.g., Olsen, 1997) provide another example of some of the ways in which school climate and structure can facilitate the adaptation of immigrant students. Lucas (1997) provided a description of the International High School in New York: a "four year comprehensive alternative high school . . . designed specifically for limited English proficient students who have been in the United States for fewer than four years" (p. 161). Because it is a school of newcomers, immigrant students are central rather than peripheral to all aspects of school life. Appreciation for diversity thus permeates the curriculum and teachers are divided into thematic clusters, "each linking four subjects around a theme and involving approximately 75 students and four to eight staff members" (p. 162). A student-centered approach, as described previously in the Medical Academy, is adopted, with extensive efforts made to create learning experiences in which students must collaborate with each other to accomplish tasks. Evaluation processes emphasize the achieving of student-defined goals and standards that demonstrate the learning they need to accomplish. Though most teachers speak English exclusively or primarily, students can take a course focusing on native language development.

There are also examples from the field of how school counselors have engaged in processes designed to learn how to learn about creating a positive acculturative press for immigrant children. McCall-Perez (2000), for example, described an action research model where school counselors gathered information about the course placement and academic outcomes for ELL through meetings with ESL teachers, observations of ESL classrooms, review of student work, and panel discussions with ELL students. As a result, some counselors learned they had seriously misjudged the English-language proficiency of their advisees. Others learned that their ELL advisees indeed held college aspirations, but had not been placed in college prep courses. This information was used to improve the school's assessment and placement of ELL students and revise the school's course schedule to devote more time to intensive English instruction and move courses requiring extensive English fluency to later in students' high school careers. In addition, the model created an electronic database of students' school experiences in their home countries and English-language proficiency that facilitated course placement decisions, despite very high student caseloads. ELL students in participating schools studied English more intensively, remained in school, and accrued more credits toward graduation and college. The use of panel discussions to gather information from key stakeholders such as ESL and general education teachers, immigrant students and their parents, and fellow counselors can go far toward giving the perspectives of immigrant students a voice and has the additional advantages of efficiency with respect to time and the use of translators.

These examples provide but a small glimpse of the possibilities for attending to the acculturative environment surrounding immigrant students in the school context. They reflect teacher–student in-class relationships, curriculum issues, structural issues around the organization of instruction, and the provision of school roles specifically dedicated to aiding immigrant student adaptation. The primary purpose for discussing them is to (a) draw attention to some of the many possible ways that the acculturative environment of schools can become a central concern and (b) provide ideas for school counselors about some of the different ways in which they, in collaboration with school colleagues, can influence this context. We close this chapter with a more focused set of comments on the implications of all of the previous discussions for the role of school counselor.

Conclusion

The preceding has outlined a general perspective on the school as an acculturative environment for immigrant students. The primary rationale for this approach was twofold: (a) to provide a perspective on how encompassing school influences are on immigrant and refugee students as they attempt to cope with adaptation to a new school in a new

land and (b) to suggest, in concert with emerging literature in the counseling area (Dollarhide, 2003; Hernandez & Seem, 2004; Ito, 2004; Sink, 2002; Tatar & Bekerman, 2002), that school counselors can play critical roles for these students both by attending to their traditional roles and by adopting newer roles that focus on their abilities to affect the school as a community with respect to the needs of immigrant students. Throughout, specific ideas for potential school counselor roles have been mentioned. They fall generally into two broad categories: (a) operating within the existing normative roles of school counselors and (b) role stretching or drawing on the skills and expertise of school counselors to engage in new activities designed.

The former is more likely to consist of direct service to students and parents. Examples here may include developing processes to ensure that immigrant students and families have access to understandable information about both the specifics of how to "do school" and the broader knowledge of how schools function and how issues such as course placement affect life chances. Here, several authors (Lucas, 1997; Stanton-Salazar, 2001) have provided ideas about the specific kinds of information that will help immigrant make the most of the opportunities available and keep future options open. These include understanding the implications of such practices as tracking, how placement decisions are made, and how to make sure the requirements for entry into the honors program are fulfilled.

However, the school counselor role can also be stretched to include additional functions in the purview of the school counselor but requiring additional activities. Lucas' (1997) list includes orientation workshops for families, translation of written documents for parents and children (however, some may not be literate in their native languages), ongoing parent workshops, special orientation classes, creating the role of transition counselor, integration of orientation information in ESL classes or content classes, field trips, and pairing recent immigrants with other students.

Similar role stretching can be found in Bemack and Cornely's (2002) description of their School and Family Intervention Model (SAFI) for school counselors working specifically with immigrant students and their families. Here, the expanded counselor role would include both family-focused and school-focused interventions. The family focus is manifested in creating collaborative, power-sharing, mutually influencing relations between family and school, including creating welcoming settings and opportunities for parents to get to know both counselors and school personnel and for school personnel to learn about the lives of parents. The school focus involves counselors serving as a resource for other school personnel, providing in-service training for teachers or consultation to administrators working with parent-school relationships. Structurally, it may involve developing flexible scheduling of meetings in terms of time and place to facilitate family availability due to work constraints. Bemack and Cornely viewed most of these role-stretching possibilities as extensions of the kinds of interpersonal and group dynamic skills that are part of the counselor repertoire, fully consistent with ASCA standards calling for school counselors to attend to the overall learning environment as part of their role.

Tatar and Beckerman (2002), reinforcing Bemack and Cornely's (2002) perspective on the challenges of multiculturalism for the counselor role, emphasized that knowledge of the organizational culture of the school is critical to effective school counselor role stretching. They suggested that if counselors are to engage in efforts to change aspects of the school culture, they must study the ongoing social practices of their schools. They advocated the adoption of a sociohistorical and cultural lens on the meaning of the behavior of immigrant students, fellow school personnel, and indeed, counselors as well.

To conclude, in outlining a perspective on the acculturative environment of schools, our intent has been less to recommend specific actions on the part of school counselors and more to provide a world view that can be adapted to local context. The experience of immigrant students and families in schools, of course, is varied with respect to success, as is the ability of school counselors to respond to these children and families. However, there is sufficient data on the difficulties experienced by immigrant children and families in terms of adaptation to a new country and way of life so that explicit attention to the acculturative environment of school and the potential role of the school counselor in affecting that environment is clearly warranted. The emerging calls for an expanded role for school counselors is fully consistent with this hope on our part that school counselors can build on their current training to address the bedrock questions of how our schools can better provide for their multicultural students and how school counselors can be valued resources to the families who have given so much in hopes that their children will have a better life.

VII
IMMIGRANT CHILDREN AND YOUTH IN SCHOOLS

SARAH J. LEE AND KAREN A. CORT
Teachers College, Columbia University

Currently, the demographic shift in the United States stems from the rapid increase in the influx of immigrants from around the world (U.S. Bureau of the Census, 2001). In the year 2002, there were 32.5 million immigrants living in the United States. Of those, 52.5% were born in Latin America, 25.5% in Asia, and 14% in Europe and the remaining 8% were from other parts of the world. Due to recent immigration trends and differential birth rates, people of color compose over 30% of the U.S. population, approximately 45% of whom are attending public schools (Sue & Sue, 2003; U.S. Bureau of the Census, 2000). According to A. Portes and Rumbaut (1996), immigrant children from a minority background constitute more than one half of the entire children immigrant population in the United States. Of these immigrant students, those who are of Asian and Hispanic descent make up the largest immigrant groups in the elementary and secondary schools (U.S. Department of Education, 1997). Vernez and Abrahamse (1996) also found that although immigrant children and youth were just as likely as nonimmigrants to enroll in U.S. primary and middle schools, they were less likely to attend high school. Because of this demographic shift, immigrant children and youth in schools now represent a major constituency within the public schools, and due to the challenges they face in school, this is an important focus for school counselors (U.S. Department of Homeland Security, 2004).

Past literature suggests that many immigrant students struggle to adapt to a new environment and culture, and they experience pressure to assimilate into the American mainstream (Sue & Sue, 2003). In contrast to native-born individuals in the United States, many immigrants experience additional barriers such as language acquisition, social economic status, cultural value conflict, racism and discrimination, and intergenerational conflicts (Chiu & Ring, 1998). In addition, Sue (2001) reported that many of the values, beliefs, and practices of today's society are structured to serve only a select portion of the population, which includes mainly individuals and groups from the host culture. Sue & Sue highlighted the importance for counselors to be culturally aware of their own values and biases that may be imposed onto individuals. As such, school counselors and teachers must avoid imposing these beliefs onto minority clients, as it may invalidate their own cultural values and experiences. Additional barriers to an immigrant student's academic success may be inherent to the school culture and environment. For example, school counselors and teachers may be responsible for the inappropriate instructional placements for immigrant youth, teacher prejudice, poor facilities, racism and discrimination, unmotivated teachers, and academic curricula that have little relevance to immigrants.

Due to the large diversity of the immigrant population, this chapter can give only an overview of common challenges and issues that are experienced by immigrant children and adolescents from diverse populations. This chapter will also discuss some of the between-group and within-group differences that exist among immigrant students and some of the ways in which school counselors and educators can begin effectively working with these students to provide them with the best educational support. The authors will also discuss implications for school counselors so they can begin addressing the concerns of immigrant students who have their own unique individual needs in major public school systems throughout the United States.

Research

Acculturative Stress

Many immigrants share a common experience coming into the United States—the process of migration and acculturation. This cultural change has posed new challenges for many immigrants who experience various types of stressors due to cultural and social adjustment, which is often referred to as "acculturative stress" (Garcia Coll & Magnuson, 1997; C. L. Williams & Berry, 1991). Oftentimes, stress is due to the acculturation process when an individual experiences conflict between two distinct cultures (Nwadiora & McAdoo, 1996). In addition, a major consequence of the acculturation process is associated with acculturative stress, which accounts for the variable mental health outcomes that have been observed among immigrants and refugees arriving in a new country (C. L. Williams & Berry; Nwadiora & McAdoo; Kuo & Roysircar, 2004). Within this general acculturation perspective, this notion is also found to be highly associated with culture shock (Furnham & Bochner, 1986) due to the affects of stress, which may eventually expose migrants to the risk of illness (C. L. Williams & Berry).

Research has revealed that various acculturative stressors are experienced differently among immigrants from diverse migration and generational statuses, which accounts for one's level of acculturation (Berry, Kim, Minde, & Mok, 1987; C. L. Williams & Berry, 1991). From a theoretical perspective, Berry et al. (1987) proposed four different modes of acculturation by which individuals who feel marginalized, as well as those who choose to remain separate, are likely to be highly stressed. In contrast, individuals who seek integration may experience minimal levels of stress, while those who assimilate tend to feel intermediate levels of stress. Thus, we can assume that acculturation occurs in different types of situations and that individuals may participate in and experience these changes as they vary from person to person.

More importantly, Berry et al. (1987) noted that the consequences of acculturative stress may not be applicable across cultures, especially for immigrant and refugee groups. The outcome of acculturative stress may not always be negative; positive outcomes include enhanced opportunities and mental health (Nwadiora & McAdoo, 1996). For example, although immigrants and refugees may experience similar adjustment problems, they may eventually become socialized to the norms, behaviors, and lifestyle of the dominant culture and, in turn, focus on striving for success rather than relying on a simple stress reduction (Torres & Rollock, 2004).

Because research on acculturative stress has shown varied results, Berry and Kim (1998) have suggested that acculturating groups have their own degree to which they experience stress, which can also account for their own unique ways in which they cope and deal with their problems (C. L. Williams & Berry, 1991). Thus, Coleman (1997) suggested that there is a need to understand individuals' coping mechanisms and strategies as they relate to cultural adjustment. Further, there is a need for future research to examine alternative conceptualizations of cultural adjustment and adaptation in order to provide a better understanding of this phenomenon.

Migration Pattern

Current research areas must focus more on recognizing the different types of immigrants who come into the United States, as each group has its own distinct migration experiences and sociocultural histories that play a significant role in its process of acculturation and lifestyle (Talmadge, 2002). Because of these different patterns of migration, many ethnic/racial groups are unevenly distributed within the United States. Specifically, many immigrant children and youth seem to be increasingly concentrated in urban areas such as New York City, Chicago, Los Angeles, Philadelphia, and other major cities (U.S. Bureau of the Census, 2000). Though many of the 30 million immigrants who have come to the United States since 1990 are still dispersed throughout the suburb and rural areas, most will likely affect the school systems in the aforementioned cities (F. C. Williams & Butler, 2003). This means that a core issue in the emerging field of urban education will involve the needs of immigrant children and youth.

As immigrant children and youth arrive in the United States, researchers have studied a variety of factors that may have impacted their assimilation process, such as immigration status (e.g., legal, illegal, refugee; Sue & Sue, 2003; U.S. Department of Homeland Security, 2004). In addition, Ogbu (1983) distinguished between voluntary immigrants (e.g., European) and involuntary immigrants (e.g., Africans). Involuntary immigrants came to the United States by force and enslavement, which will impact the process of acculturation and assimilation differently from groups who came to the United States by their own choice. Dawkins (2000) reported that Haitian and Cuban refugees have been found to be treated differently with the former being sent back to their homeland due to the variation of U.S. immigration policy. Similarly, Chinese immigrants are often considered as voluntary immigrants because they migrated to the United States by choice, whereas most Vietnamese refugees fled from their homelands due to war and violence (Chiu & Ring, 1998). Thus, it can be assumed that some immigrants may have an advantage of having made prior arrangements before migrating to the United States, whereas refugees are often unprepared to start a new life in an unknown country.

Roysircar-Sodowsky and Maestas (2000) reported, however, that many refugee experiences have been focused on adults and that research on immigrant youth has been very limited. Regardless, we need to be aware of the cultural stressors that may leave emotional scars for many immigrant youths who come into a new environment and, in turn, make learning difficult in school (Atkinson & Juntunen, 1994).

The heterogeneity of immigration statuses are now emerging in research literature and may assist school counselors and teachers to understand the mobility patterns and impact of circular migration within the United States. For example, while many immigrant parents bring their children to the United States for permanent residency, others many send their children back to their native country (Harkins, 2001). For example, Harkins studied a group of Kaigaishijo students, a significant subset of the Japanese population, and reported that these students returned to Japan shortly after their parents' businesses and responsibilities were completed. In other serial migration patterns, Smith, LaLonde, and Johnson (2004) found that many Caribbean parents migrated to the new country first, with the children following later, which presents other stressors for the family (Gopaul-McNicol, 1998). Thus, having an accurate assessment of children's adaptation to the host country requires an understanding of the impact of migration among immigrant families across cultures (Suarez-Orozco & Suarez-Orozco, 2001).

Acculturation

Immigrant students cannot be understood without considering the range of migration experiences that characterize these children and their families. Thus, the process of acculturation is one of the most explored topics in understanding the migration experiences for immigrants across cultures, which is also a significant part of their developmental process (Berry, 1997; Mitchell, 2005). One definition of *acculturation* refers to changes in cultures, values, and behaviors that individuals make as they gradually conform to the dominant group or society (Mitchell). For many Hispanics, the process of acculturation has been assessed by identifying differences among their generational status due to migration streams from Mexico, Central America, and South America, including the Caribbean, which is sending a large number of Hispanics into the urban areas of the United States (Rogler, Cortes, & Malgady, 1991). Coupling the importance of generational status, it is also imperative for school counselors to be aware of the heterogeneity of immigrants that enter the United States and understand the differences in immigration status (Chiu & Ring, 1998).

Consistent with other studies, B. S. Kim, Brenner, Liang, and Asay (2003) reported that one's level of acculturation is linked to generation status. These generation trends include 1st-generation, 1.5-generation, and 2nd-generation immigration statuses (B. S. Kim et al., 2003). Many immigrant children may identify most with the 1.5 generation, meaning they were born in their native country and later moved to the United States, whereas 2nd-generation individuals were born in the United States. Immigrants who were born in their native country and arrived in the United States sometime during their adult years are referred to as "1st-generation immigrants." Many Asian Americans use the term *1.5-generation* to describe individuals who have immigrated to the United States during early childhood or adolescent years, so that most of their developmental years were spent and their identity established in the United States (B. S. Kim et al.). The differences in generation statuses may be critical in helping school counselors to understand the adaptation experiences of each immigrant group, especially immigrant students in comparison with the adult immigrant population. Thus, the impact of generation statuses as part of the acculturation process is most likely to be experienced by children in the school setting because much of their development and socialization occurs within this context (James, 1997a). Hence, it is important for school counselors to have the awareness, knowledge, and skills to assess students' migration experiences, potential traumas, and challenges in acculturation as they settle into a new country (Sue & Sue, 2003). School counselors have a significant role in establishing the social and educational setting into which a student immigrates, so it is important for them to understand the complex process of acculturation as it impacts immigrant students' academic performance (Harkins, 2001).

Although immigrant children and youth are one of the fastest growing groups in the educational school system, there is still a paucity of research and resources available to better address the salient needs of this population (Gibbs, Huang, & Associates, 1989). In order to better meet the needs of each student, counselors need to gather more information about specific immigrant children and youth populations. As previously mentioned, each child is unique and has special needs and concerns that may be different from the group with which he or she identifies. Because little has been written about counseling immigrant youth, this chapter addresses some generic concerns and needs that are of great urgency when working with immigrant students in schools. It also offers some possibilities for individual and institutional changes that will lead to more effective education for students across cultures. This field needs studies that account for the various settlement patterns, immigration statuses, generational statuses, and behaviors exhibited by different immigrants across cultures.

Culture Shock

The influx of newly arrived immigrants into the United States is most affected by culture shock, which is described as a series of disorienting encounters that occur when individuals are faced with challenging events and contacts with a new culture that are inconsistent with their basic values, beliefs, cultures, and lifestyles (Lynch, 1992; Yost & Lucas, 2002). More specifically, culture shock is a psychological reality for many immigrant children and youth who come to a host culture that is different from their native country, especially in a new school setting (Kaplan & Eckermann, 1996; Eckermann, 1994). In addition, Eckermann (1994) argued that immigrant children who are able to identify with the school environment in terms of language, values, and experiences were more likely to have better adjustment than those who could not make this identification. On the other hand, the immigrant students who felt disconnected from the school environment were found to experience acute culture shock, which, in turn, negatively impacted their social development and performance in learning. As such, understanding the adjustment process as it relates to culture shock is extremely important because the experience of culture shock is often so great that it impedes individuals from effectively solving problems, making decisions, and interacting positively when they feel overwhelmed and uncomfortable in the environment (Draine & Hall, 1986).

According to Bhattacharya (2000), many immigrant children find that cultural differences between their native homeland and the host country play a significant part in their academic achievement. For example, in a study of Aboriginal children, Kaplan and Eckermann (1996) found that culture shock was highly associated with stress and anxiety, which was one of the major factors negatively impacting the children's ability to achieve in school. Similarly, many Asian immigrant adolescents may be disappointed after arriving to the United States when they realize that their new life does not meet their expectations. As a result, their disappointment may lead to distress such as feelings of anger, resentment, and depression (Yeh, 2003).

Culture shock is a common problem shared by many immigrants; however, it may also be more salient in the lives of refugees (Drachman & Halberstadt, 1992). According to Drachman and Halberstadt, refugees suffered psychological and physical trauma before their immigration, due to traumatic events such as war and violence (Chiu & Ring, 1998), which include feelings of isolation, fear, anxiety, and resistance to change (Igoa, 1995). Thus, experiencing both culture shock and the psychological effects from their homeland may be more severe than in other immigrant populations (Yost & Lucas, 2002); however, the affects of culture shock are prevalent across all cultures and must be further examined, as it clearly impacts the academic achievement of immigrant children in school (Bhattacharya, 2000).

Language Barrier

Statistics revealed that immigrant children and youth constitute a large percentage of public school enrollment from K–12 (U.S. Department of Homeland Security, 2004). Acknowledging potential barriers regarding lack of language proficiency is an important area to be considered (Graham, 1995). Students who speak another language and have limited proficiency in English are found to be one of the fastest growing populations in public schools in the United States (Smith-Davis, 2004a). In fact, 350 different languages are spoken in school districts across the United States.

The new immigrant populations are a diverse group, as they vary on their level of prior education and literacy in the native language (Smith-Davis, 2004b). Thus, it is important for school counselors to be aware of the heterogeneity of language spoken by immigrant students in both school and home settings. The variation in the immigrants' academic competence in their culture of origin compounds the difficulties many immigrant populations experience as they struggle to acquire English as a second language (Sue & Sue, 2003). Thus, learning a new language may impede academic performance and, in turn, become a source of stress, especially for students who fear speaking in a classroom setting, which is a common practice for schools in the United States (Bhattacharya, 2000; James, 1997a). Simultaneously, it is most noteworthy to recognize that immigrant students enter school with varying degrees of preparation and educational competencies, which can impact their academic performance. While understanding the challenges of learning a second language, it is also important to recognize that learning a second language may not be the main problem but it is the fact that students may have been illiterate or preliterate in their own native language. Kang, Kuehn, and Herrell (1994) found that Hmong students in grades K–12 face a difficult challenge because the Hmong language was only recently written (about 30 years ago); therefore, most of the children may not have received adequate academic preparation for their grade level (Schwartz & Stiefel, 2004).

Many immigrant students face different barriers and limitations than those faced by native-born children, such as developing English language skills, learning basic academic concepts needed to function in U.S. schools, overcoming difficulties in communication, and gaining cultural knowledge. Even when a child has learned the basic conversational aspects of the second language, it may still take some time for a child to fully comprehend on a level of

cognitive and academic functioning (Schwartz & Stiefel, 2004). Thus, there is a particular concern in the cases where various schools are not adequately equipped with the tools and resources to help maximize the potential of immigrant populations. Further, it is crucial that school counselors understand the effects of acculturative factors such as generational status, language barriers, linguistic differences, lack of understanding of prior education, and experiences of immigrant students, which pose new challenges on educational achievement in working effectively with this population (Yeh & Inose, 2002).

Social Economic Status

As noted above, difficulty with language may be one of several stressors experienced by immigrant children and youth who transition into a new culture (Bhattacharya, 2000). Another increasing area of concern is the academic school achievement of immigrant youth and the effects of social economic status and parental support that children receive at home, which have an impact of academic performance (Coleman, 1997). The U.S. Bureau of the Census (2000) reported that 11% of nonimmigrants have income below the poverty level while 17% of immigrant households were estimated at being below the poverty level. In general, immigrant children who are raised in families whose incomes is below the poverty level may be more likely to fail academically and eventually drop out of school than nonimmigrants (Taylor, 2004).

Research suggests that social economic status may be linked to academic performance for many immigrant adolescents (James, 1997a). Several authors suggested that many adolescents who come from low-income families might work long hours to help support the family and that may impact their ability to attend school and, in turn, affect their ability to learn in school (Mitchell, 2005; Zhou, 2003). For example, in a culture of migration, adolescents may have to take the responsibility of becoming a labor migrant as part of their transition from adolescent into adulthood. To support this notion, Mitchell reported that Caribbean Americans had a high labor force participation and median income. Statistics indicated, however, that this population may also work multiple jobs to maintain a steady income for their household. Similarly, many Asian American families are reported to have higher median income compared with the general population; however, statistics do not take into account the high percentage of Asian American families with multiple individual family members contributing to the family income (Sue & Sue, 2003).

Many immigrant populations may struggle with low social economic status as it relates to language barrier. For example, several authors found that one of the overarching themes among the immigrant population is their inability to effectively communicate due to language barrier and the subsequent negative impact on their employment opportunities (Chun, Eastman, Wang, & Sue, 1998; Sue & Sue, 2003). Sandhu (1997) reported that many Southeast Asians are three times more likely to be on welfare compared with the general population due to lack of job skills and English language barriers. As a result, young adolescents may experience frustration, helplessness, and low self-esteem, which may lead to academic failure and various psychological problems (Yeh & Inose, 2002).

Racism/Discrimination

There is substantive support to the argument that immigrants may experience additional sources of stress and problems such as immigrant status, poverty, racism, discrimination, and prejudices by society in comparison with persons from the host country (Yeh & Inose, 2002; Sue & Sue, 2003; Yost & Lucus, 2002). More specifically, the impact of racism and prejudice may be an important development task for immigrant children and adolescents to manage, particularly immigrants of color and, in turn, such a task may affect their academic achievement (Garcia Coll & Magnuson, 1997). The increasing reports of racism and prejudices encountered by immigrant children and youth, however, have become more complex and difficult to document. As a result, this area of concern has been subject to limited research; more investigation to understand the behavioral and psychological impact of immigrant population is warranted.

In an attempt to better understand the impact of racism and discrimination, it is crucial to understand that these experiences may be largely dependent upon multiple factors for each immigrant as an individual and as a group. Many Asian immigrant youth may face additional challenges such as racial discrimination and stereotypes than their White American counterparts (Chiu & Ring, 1998). For example, many Asian immigrant youth are often labeled with the notion of the "model minority myth," which suggests that Asians are academically successful and do not exhibit major problems (Chiu & Ring, 1998). In addition, school counselors may have higher expectations of Asian students academically due to their reputation as good students while other students may engender hostility toward these students for the same reason (Herring, 1997). This myth can serve to invalidate the experiences of Asian immigrant children and youth because it assumes that they do not have any adjustment issues or problems (Yeh & Inose, 2002). It is also important to note, however, that many European immigrants from Eastern and Southern Europe (i.e., non-English immigrants) may experience prejudice and discrimination from "native" Anglo Americans who viewed them as being culturally inferior due to their disadvantaged

status and language barrier (Giordano & McGoldrick, 1996). Thus, it is critical for counselors to recognize the salience of racism experienced by immigrant children across all cultures, regardless of race and ethnicity.

As previously mentioned, while many immigrant adolescents already struggle with the hardship of learning the English language, they may face an additional stressor of feeling stigmatized when speaking in class and may find discrimination and stereotyping to be a confusing experience (Yeh & Inose, 2002). In addition, the educational school system may also contribute to their stress through implicit and explicit racist educational policies, intergroup conflict and tension, and teachers who do not have or demonstrate multicultural competence. Sue & Sue (2003) stated that it is vital for educators, counselors, and teachers who work with immigrant youth to understand how social and cultural forces have impacted and shaped the lifestyle of this type of population. Within this frame of mind, educational systems must engage in careful examination of the values being taught and how these values influence culturally diverse groups as well as members of the dominant culture. Thus, educators are responsible for being aware of and countering particular stereotypes, prejudices, and discrimination that immigrant students face within the school environment. Overall, school counselors should be aware of the fueling of public stereotypes and prejudices against immigrant groups, which may potentially affect immigrant students' school performance and achievement.

Intergenerational Conflict

Generational conflicts between parents and adolescents in the United States have been a continuous challenge, as this conflict is a core theme within the acculturation process (Herring, 1997). In particular, immigrant adolescents experience intergenerational clash with their parents because of differences in values, customs, and lifestyles—as adolescents become more assimilated into the "American" lifestyle—that are at odds with their parents' expectations (James, 1997b). As a result, immigrant parents often perceive their children's attempts to separate and individuate from their family roots as a rejection of the entire family, its values, and the culture it represents. Further, many parents may resist their children's acculturation, as it causes family conflict between what adolescents aspire for in life contrasted with what is expected of them by their parents (James, 1997b). Another source of intergenerational conflict has been the experiences of immigrant children who are often caught between double roles when they serve as a cultural bridge for their parents (Garcia Coll & Magnuson, 1997). According to Baptiste (1993), school-age children were found to acculturate faster by adapting to a new culture and learning a new language more rapidly than their parents through their exposure to the school environment. In a study conducted with Southeast Asian immigrant children, S. Kim, Coletti, Williams, and Hepler (1995) found that when immigrant parents have limited English acquisition, the children feel obligated to master the English language more quickly in order to help translate for their parents. The child assumes a new role in the family and serves as the cultural translator for his or her parents by completing job applications, shopping, using public transportation, being an interpreter during doctor visits, and engaging in particular situations in which they would not otherwise engage (Baptiste; S. Kim et al., 1995). Thus, the generational boundaries are crossed because the parent may rely heavily on the child to take certain responsibilities and make decisions that impact the entire family and, in turn, cause distress for the child. Further, parents may also feel distressed and frustrated by the role reversal of the child–parent relationship and come to resent their dependence on the child (Garcia Coll & Magnuson, 1997).

Psychological Effects

Immigrating to a new country involves different types of adjustments and transitions that may affect the emotional and psychological health of the family unit as well as the individual family members (Smith et al., 2004). As discussed throughout the chapter, we can assume that the aforementioned challenges and barriers (i.e., culture shock, acculturative stress) may become a clinical issue when they manifests into various elevated symptoms and mental disorders (Berry et al., 1987; Furnham & Bochner, 1986; Garcia Coll & Magnuson, 1997). For many immigrant children and youth, stress may be a significant factor in understanding mental health and development during adolescence (Chiu & Ring, 1998; Colten & Gore, 1991) due to the transition of leaving behind a familiar language, culture, community, and society (James, 1997a). According to Berry (1990), stress is often precursor for many immigrants leading to lowered mental health, feelings of marginality, isolation, and high levels of psychosomatic symptoms.

At the same time, Sluzki (1979) reported that many immigrants may not be aware of the emotional and psychological impact of their new environment and, in turn, may negate the stressful experience of their migration process. James (1997b) asserted that psychological suffering and trauma may be less visible and more difficult to measure, especially for illegal immigrants, who must cope with the problem of being discovered and deported back to their homeland. Several researchers found specific circumstances inherent to the migration process that may be stressful for young immigrants. For example, in a study involving Chinese immigrants (i.e., student visa holders) and American-born students, the former group reported

loneliness, isolation, language and communication barriers, and being homesick, in contrast with their American counterparts (Igoa, 1995; C. L. Williams & Berry, 1991; Zheng & Berry, 1991). As a result of various stressors, Chinese immigrants reported more general anxiety symptoms (Chung, 1994), which were also found to be related to depression (Constantine, Okazaki, & Utsey, 2004).

Similarly, Draine and Hall (1986) found that discomfort in the environment may lead to a series of emotional and physical distress such as frustration, anger, depression, withdrawal, and various illnesses that may be difficult for the individual to handle. Although recent psychology literature reveals that many immigrant youth demonstrate psychological problems (Chiu & Ring, 1998), they are less likely to seek mental health care services than nonimmigrants are (Munroe-Blum, Boyle, Offord, & Kates, 1989; Sue & Sue, 2003). In general, it is important to consider that although immigrant families may experience stress, they may not seek treatment for their members due to a myriad of cultural reasons, which include differences in values, beliefs, background, and experiences (Sue & Sue, 2003).

Conclusion

The aim of this chapter was to provide a comprehensive overview of problems and issues that are commonly encountered by immigrant children and youth from across cultures, particularly in the context of education. More importantly, the authors' intentions were to help readers understand the complexity of an immigrant student's migration history, level of acculturation, language, and cultural factors, as well as their effect on academic achievement, as each individual has his or her own unique and individual experiences. In addition, one cannot assume that all immigrant children and youth have the same exact experiences, but rather, one must recognize the heterogeneity of each immigrant youth and, in turn, embrace the diversity that exists within all students. Because immigrants are a heterogeneous group, it is critical that counselors, practitioners, and researchers explore other patterns of underlying issues that have not surfaced into discussion. Further, the next section will provide specific ways in which theoretical models and practical guidelines can be applied in counseling practice, education, and research.

Conceptual Frameworks

Several theories have influenced school counselors when working with immigrant youth. The cultural deprivation and the cultural diversity models, however, illustrate the dynamic influence and relationship between the individual students and their culture, which accounts for the essence of the working relationship between school counselors and immigrant students (Coleman, 1995).

Cultural Deprivation Model

Although school counseling has existed since the 1920s, the profession became officially standardized and uniform several decades later. In the 1950s and '60s, as a result of the creation of the American Personnel and Guidance Association in 1952 (now the American Counseling Association [ACA]), the passage of the National Defense Education Act in 1958, and the increased school enrollments caused by the baby boomers, the training programs of school counselors increased in number and became standardized (Baker & Gerler, 2004).

During this time period, the term *cultural deprivation* was frequently used to describe underachieving students in the public school system and to indicate that many groups performed poorly on tests or exhibited negative characteristics because they were culturally impoverished and lacked many of the advantages of White middle-class culture (Sue & Sue, 2003). Given the fact that school counselor training programs were being established during this time, we can assume that the cultural deprivation ideology heavily influenced the curricula and techniques of school counselor trainees, as well as those of practicing school counselors. This ideology unfortunately places the blame of deficiency on the individual, perpetuating the myth of minority inferiority and superiority of White middle-class values. The core thesis of the cultural deprivation model is that the host society (i.e., American society) is what is perceived as normal and valued. If one does not have that culture, one is deprived. This suggests that immigrant does not have a culture of value, which they bring to the school.

School counselors were, therefore, being trained to assimilate students into White American cultural norms and values. Pathology was being equated with deviation from these norms, which is particularly detrimental and harmful when working with immigrant youth who are from diverse cultures, especially immigrant students of color. Their cultural background was often being invalidated and was cited as the source of their pathology and lack of success in the American educational system. Unfortunately, this ideology predominated American culture for decades.

Culturally Diverse Model

As the United States has become more racially and ethnically diverse, the school counseling profession has been challenged and is being held accountable for promoting academic achievement for *all* students, through efforts such

as the National Model of Comprehensive School Counseling Programs (Baker & Gerler, 2004). Through such initiatives and over time, a shift in the predominant ideology of cultural deprivation to cultural diversity has occurred. School counselors are now being called upon to recognize the legitimacy of alternative lifestyles and the value of cultural differences. The "cultural diversity" ideology implies that all racial/ethnic groups are equally valued and that all cultural perspectives are important in understanding human development and behavior. Comparisons of different cultural groups should not be made, in particular against the White American cultural standard (Sue & Sue, 2003). School counselors have slowly begun to develop interventions and instructional guidelines that reflect the racial and cultural experiences of racial/ethnic groups of people (Carter, 1995). This shift in ideology serves to empower immigrant students (who are often from racial/ethnic minority groups), instead of forcing them to assimilate and ascribe to foreign (and often oppressive) norms and behaviors (Constantine & Gushue, 2003).

Throughout the history of the school counseling profession, these two drastically different ideologies have influenced the practice and training of school counselors. The cultural deprivation model served to allow school counselors to focus on the assimilation of racially and ethnically diverse students and immigrant youth into White cultural standards and behaviors through attempts to realize the myth of the "melting pot." Although this practice was somewhat successful in facilitating the academic accomplishment of European immigrants through the 1940s, it has not demonstrated its effectiveness with non-European immigrants. As the United States has become more racially and ethnically diverse, particularly with immigrants from non-European backgrounds, the cultural diversity model has encouraged school counselors to assess and understand the value of different cultures, and how these differences can both positively and negatively influence the immigrant students. This focus on integration may be more effective at promoting academic accomplishment among recent immigrants than the assimilationist approach of a previous generation.

With a greater understanding of the conceptual frameworks that influence school counselors' training and role, the next section will examine the ways in which school counselors have engaged in their work with immigrant students.

Practice

Historically, the U.S. educational system has been constructed and defined by the dominant culture (i.e., White Anglo-Saxon Protestant middle-class American), This system focuses mainly on U.S.-born students without taking into account the broad spectrum of students who migrate from diverse cultures around the world (Bemak & Chung, 2003). In reviewing the experiences of immigrant children and adolescents in the American educational system, it is critical for school counselors to become involved in making the changes that will lead to greater success for immigrant youth. A school counselor is the first person in school that immigrant students encounter, since, in most school settings, the school counselor is the person responsible for initial registration, as well as academic scheduling and course planning. In these initial introductions, as well as through access to records, counselors are often the first to learn and identify the daily struggles to survive and the more immediate social and economic stressors with which the immigrant student may be dealing (which can be a higher priority in the immediate, than are the benefits of a seemingly abstract and far-reaching goal of graduation; Bemak & Chung). Counselors are, therefore, well positioned to work with immigrant students and assist in their successful transition to the American school environment. School counselors may, however, be called upon to extend themselves beyond their traditional roles when working with immigrant students, and they may need to serve as leaders, advocates, and social change agents in the school and in the community at large.

The next section will be a brief review of recommendations and strategies for school counselors to utilize when working with immigrant students in school.

Multicultural Competence

Before any helping professional begins his or her work with any client, he or she must strive to achieve multicultural competence. In the broadest sense, multicultural competence is the ability to effectively provide services cross-culturally (Sue & Sue, 2003), and it should be achieved through both didactic training and ongoing self-exploration and experiential learning. For school counselors, multicultural competence may involve broadening the roles that counselors play and pushing them to expand their repertoire of appropriate helping skills (Sue & Sue), especially when working with immigrant youth, who are often from cultural backgrounds that are different from the counselor's background. Research has found that school counselors with previous multicultural training and higher tolerance to ethnic diversity have been found to better conceptualize the mental health issues of immigrant students and are better able to consider and integrate salient cultural information in the context of conceptualizing and addressing their presenting concerns (Constantine & Gushue, 2003). Multicultural competence generally focuses on three domains: (a)

understanding attitudes/beliefs of one's own culture, (b) understanding the worldview of others, and (c) the ability to determine and use culturally appropriate intervention strategies with clients (Sue & Sue).

Understanding Ourselves

School counselors must begin with awareness of their own assumptions, values, and biases, which will impact their work with clients (Sue & Sue, 2003). Counselors need to become knowledgeable about how race, culture, and all of their reference group memberships affect their thoughts, behaviors, and interactions with others. How we view and understand the world is from our cultural lens, and often unconsciously, our thoughts, behaviors, and interactions reflect our own values and beliefs (Sue & Sue). Counselors cannot assume that their values and beliefs are shared by others, and if they are not aware of their own cultural beliefs (on both an intellectual *and* emotional level), they may impose their perspective onto others and ultimately invalidate and oppress them.

Understanding Others

Once school counselors gain an understanding of themselves, they must then try to understand the worldview and experiences of their students. School counselors need to gain knowledge about cultural nuances and different cultural experiences, values, and norms of the immigrant population, as well as how acculturation may be impacting them in various ways (F. C. Williams & Butler, 2003). Counselors should not strive to become cultural "experts," nor do they have to hold these worldviews themselves. Instead, school counselors need to accept the worldviews of others in a nonjudgmental manner, in order to be able to effectively counsel and assist immigrant students (Sue & Sue, 2003).

For example, during a meeting with an Asian immigrant student to conduct initial course scheduling/planning, the school counselor must first be aware of his or her own assumptions and beliefs about Asians, as he or she may hold inappropriate, stereotypical beliefs about this group. The counselor may assume that the student is either highly intelligent (due to the belief in the model minority myth), or conversely low functioning (because of the belief that the student is not capable due to an assumed level of English language ability). These stereotypical beliefs may influence the counselor and result in misplacement of and unsuitable course selection for the student, setting the student up for potential failure. The counselor needs to be cognizant not only of his or her personal biases regarding Asians, but of Asian cultural values as well. Awareness of cultural values may help counselors assist immigrant students with the most suitable course selections. For instance, the aforementioned school counselor working with the Asian immigrant student should have some knowledge of the Asian cultural value system of cooperation and collectivism (versus the American values of competition and individualism). As such, the Asian immigrant student first entering an American school system could benefit from classes or teachers that work more collaboratively or in groups, as opposed to courses that focus more on individualism (e.g., debate class). Moreover, in class, this student may tend to keep to himself and be quiet in class discussions, especially during heated debates, and he may hesitate to confront others in order to avoid interpersonal conflicts. Although their behavior is congruent with their cultural value system, once they are in America, many Asian immigrant youth encounter values and customs that are contradictory to those of their country of origin. What these youth understand as accepted norms and behavioral patterns in their country of origin may be ridiculed or misunderstood in America, which can create confusion and discomfort for them (Yeh & Inose, 2002). Counselors with an understanding of Asian cultural values may be able to educate and train teachers on how to work effectively with immigrant youth, as well as how to deal with cultural tensions in the classroom.

Moreover, for many immigrant youth of color, the experience of racism and racial labeling is a unique and often traumatizing experience for them in the United States. Many did not encounter this experience in their native lands. Many immigrant youth are moving from countries that are racially homogeneous (e.g., Asian countries), or from places where ethnic categories are more important. For example, in some Muslim countries, it is more important to be identified by sect—such as Shiite—than by skin color (F. C. Williams & Butler, 2003). These youth may find being stereotyped and discriminated against due to the color of their skin very confusing (Yeh & Inose, 2002), and they may have to assume a new racial identity. Moreover, many West Indian immigrant youth may be contending with similar levels of racism as native-born Black Americans, which again may serve to confuse and paralyze them, as they were not socialized with the history of racial oppression found in the United States and may not understand how to adapt and survive discrimination and prejudice of this type (Albertini, 2004).

Multiculturally competent school counselors need to be aware of and acknowledge the insidious nature of racism and racial oppression in the United States, especially within the school environment. They must be supportive of their immigrant students of color instead of invalidating their experiences. On an individual level, school counselors should make an effort to check in and meet with new immigrant students, providing them with an opportunity

to discuss their adjustment experiences. Moreover, on a larger scale, counselors can conduct workshops to educate not only the immigrant youth, but also the school faculty and staff overall about prejudice and discrimination within contemporary society. All too often in today's society, it is assumed that prejudice and discrimination no longer exist, due to the effects of the Civil Rights Movement and other social justice efforts. Although these efforts have been successful in decreasing overt discrimination and creating more opportunities for racial/ethnic minority groups, prejudice and discrimination continue to rear their ugly head sand impact all our lives. Media is often helpful in addressing these sensitive topics, and counselors can utilize films such as, *A Class Divided* with Jane Elliott, or a more recent film *Crash.* Both vividly depict how prejudice develops, as well as the lethal effects of discrimination.

On their quest to acquire cultural knowledge and information of others, school counselors need to be wary and careful not to stereotype. Although people from certain groups may share common values and worldviews, it does not mean that all people from these groups are the same; we are all individuals and group members (Sue & Sue, 2003). For example, many Asian immigrant youth suffer from the model minority myth. Some school counselors overlook the psychological problems of Asian immigrant youth and consequently fail to provide effective interventions to them, for they assume that all Asian students are well adjusted because many are compliant and may be excelling academically (Yeh & Inose, 2002).

Culturally Appropriate Strategies

Different racial/ethnic groups respond best to culture-specific strategies of helping, and this is especially true for immigrant youth. Greater effectiveness is most likely achieved when the school counselor takes on different roles and utilizes different modalities that may be more consistent with the life experiences and cultural values of their students (Sue & Sue, 2003). Most theories of counseling that school counselors are exposed to in their training programs generally prescribe the types of actions and roles played by a counselor; however, these may prove minimally helpful to immigrant students, and as such, school counselors may need to expand their range of helping responses (Sue & Sue). For example, "talk therapy" may not be congruent with Asian cultural values. For many Asians, it is not culturally appropriate to discuss personal concerns with others, as it may cause shame for the whole family and may be deemed culturally stigmatizing (Yeh & Inose, 2002). Therefore, in working with Asian immigrant youth, school counselors may have to utilize more creative techniques in order to understand their concerns and help attain psychological well-being, instead of meeting individually with students in their offices.

The following section is a list of recommendations and culturally appropriate strategies and interventions that may be helpful for practicing school counselors working with diverse immigrant youth.

Recommendations

Work With Students Individually and in Groups

School counselors are often the first line of defense to identify students with psychological—as well as survival—issues, and their traditional training offers a wide variety of ways in which school counselors can intervene with immigrant students individually. Primarily though, when working with immigrant students, counselors should try to build on students' strengths. Many immigrant students are resilient and have learned how to survive in highly complex and confusing worlds. School counselors should capitalize on these strengths to increase student adjustment and academic achievement, and to help foster an overall positive outlook for students (Bemak & Chung, 2003).

School counselors should also work to determine aspirations and future plans of immigrant students. All too often, many immigrant youth are not aware of employment opportunities and educational experiences available to them in the United States. Counselors should work to provide students with a complete set of options into potential future careers and educational opportunities (Mitchell, 2005). One groundbreaking program in the area of career development has been conducted by Shea, Yeh, Ma, Lee, and Pituc (2007). This program, known as CEDAR (career exploration development and resource group), involved low-income, urban, Chinese immigrant youth. They participated in an 8-week group within the school, which was intended to incorporate cultural and systemic factors, such as racism and cultural values, related to career development process. The program provided students with specific career information, social support, and role modeling, and was aimed at promoting their self-efficacy in making career choices. One key element of the program was that the leader conducted the group sessions in the students' native Chinese language, making the program culturally sensitive and available to greater numbers of students. Overall outcome analysis of the group thus far reveals that group participants have demonstrated increased career decision-making self-efficacy and increased clarification of career interests.

School counselors must also remember that immigrant youth are similar to their American counterparts and are confronting the challenges of the transition from childhood to adulthood. They, too, need support and help in dealing with and conquering the developmental milestones, such as identity development, especially among the middle- and high-school years (F. C. Williams & Butler, 2003).

While school counselors are in the best position and are primarily trained to provide individualized attention to students, it has been well established that group work is quite effective with immigrant youth, especially for those from more collectivistic cultures where social relationships and cooperation are highly valued (Bemak & Chung, 2003). Therefore, school counselors need to involve themselves with greater numbers of students, such as forming support groups, transition groups, or academic circles with the goal of assisting immigrant students in becoming adept at survival in their new scholastic environment (F. C. Williams & Butler, 2003). One simple initiative school counselors can take is the formation of a peer support/mentoring group. Since school counselors have contact with all new students during course planning, they can identify potential group members, as well as immigrant peers who are more established within the school community. These groups may address such topics as (a) negative experiences such as racism and discrimination, (b) frustration caused by limited English proficiency, (c) cultural conflicts, (d) peer pressure, and (e) parental conflict. The development of peer groups offers an opportunity for immigrant youth to build supportive alliances and relationships *at school*, gain knowledge and advice from others who may be going through similar experiences, and identify a caring adult role model. In addition, this is a no-cost intervention involving minimal time for counselors.

Utilize Peers

Positive relationships with peers are essential for adjustment to school, not only for immigrant youth, but also for all school children, particularly in the adolescent years. Many immigrant youth may not be accepted by their peers when they first enter the American school system. This lack of acceptance may occur often because of misunderstanding based on differences in language, dress, and patterns of speech (F. C. Williams & Butler, 2003). School counselors can lead efforts to promote healthy peer relationships by introducing cross-cultural sharing and learning relationships and establishing cooperative learning activities, both social and academic. Moreover, counselors can train peers to work collaboratively with them as "peer counselors" (F. C. Williams & Butler).

Empower Families of Immigrant Youth

School counselors have an obligation to support and inform immigrant families about the educational system and their role in it, as well as empower families to become involved in shaping their child's future. They should work to encourage parental involvement of immigrant students, which may be challenging, as there may be many barriers impeding their involvement. Some of these include (a) language differences, (b) cultural conflict, (c) lack of familial support, (d) isolation in a new and strange country, (e) intergenerational conflict with their children, (f) employment/financial concerns, and (g) a general lack of knowledge of American institutions and organization, especially the school system (Fuligni, 1997). This is particularly exemplified with Caribbean immigrant parents. Caribbean parents are often unaware of the need to closely monitor their child's experience in school because of their culturally different understanding of the educational system. Parents in the Caribbean place ultimate trust in teachers as professionals who will make the best decisions for the child's academic progress, so these parents are less involved (however, they are still invested). Therefore, when American school personnel misguide students and push them into vocational programs and other nonacademic classes, Caribbean parents often believe that teachers are making the best educational decisions for their child and do not advocate for changes in their child's prescribed academic course (Mitchell, 2005); however, school faculty may view them as being complacent and not caring. School counselors need to make a concerted effort to learn as much as possible about immigrant families and the values that underlie the family unit, roles, and structure. They should be careful not to prejudge family structure from their own ethnocentric perspective (Sue & Sue, 2003). Moreover, counselors need to inform and educate immigrant parents about the American school system through parent informational meetings scheduled at convenient times for working parents. Meetings and materials should be written and translated into different languages (Mitchell). Additionally, programs or meetings with parents do not always have to be on school premises, especially since the families of immigrant youth often cannot attend meetings at school due to scheduling conflicts. One idea to involve parents would be to conduct parent meetings at apartment complexes where a large number of students reside, at churches, or even at community centers, in order to increase possible attendance and/or alleviate transportation concerns. Additionally, parent meetings should involve incentives for attendance, such as providing meals, babysitting, training (e.g., free income tax assistance), or school benefits for their child (e.g., trips).

Teach School Survival Skills

Learning basic school survival skills is essential, as immigrant students need to learn how to negotiate American schools and, in general, need assistance in adjusting to the school culture, given their lack of experience with American institutions. Simple procedures and tasks that most American students take for granted—such as moving from one class to another, being taught by several different teachers each day, and the length of classes and the school day—may all be foreign experiences to immigrant students (F. C. Williams & Butler, 2003). Moreover, the lack of English competence for so many immigrant youth compounds the situation even more and poses yet another challenge for immigrant students attempting to survive in the American public school system (Yeh & Inose, 2002). English competence, at the very least, is required in order to know and understand what is going on in their classrooms, and it is necessary to allow them to excel academically and to perform just as well as they did when they attended school in their home countries and in their native languages (Bemak & Chung, 2003).

Teaching basic school survival skills is within the scope of training and skills of multiculturally competent school counselors. School counselors can serve as "cultural translators," interpreting American cultural patterns and norms for immigrant youth and explicitly offering didactic training in methods and techniques for surviving the daily challenges of school. School counselors can provide orientation programs, create handbooks and/or guides for immigrant students to refer to policies and procedures and can initiate clubs for immigrant students to create support systems and opportunities for students to learn and benefit from each other (Juntunen, Atkinson, & Tierney, 2003).

Become Open to and Try Alternative Methods of Helping

School counselors should be open to and appreciate alternative and indigenous cultural methods of helping of their immigrant students. Traditional "talk therapy" is not the only manner in which people can be helped, though it is superior to other types of healing (although they may not seem "scientific").

In addition, spirituality and religion are important and powerful aspects of the lives of many immigrant youth. School counselors should consider student's religious and/or spiritual values and should work to incorporate these values and beliefs into ways in which they support immigrant students. For example, many Korean immigrant youth tend to utilize religious practices, as church plays the role of extended family and they feel more comfortable sharing their problems with the religious community (Yeh & Inose, 2002; Suh & Satcher, 2005).

Become an Advocate for Immigrant Youth in the School

The relationship between students and all school faculty and staff is an important bridge to students' school experience, and this is especially true for immigrant students. As immigrant students settle in the United States and spend more time in a school cultural environment that opposes their heritage cultural norms, they begin to have negative experiences in schools and exhibit declining achievement patterns. School counselors need to begin to identify what specific negative factors exist in the school environment that, over time, dampen aspirations and academic functioning of immigrants (Mitchell, 2005). School counselors should advocate for the creation of a school environment that actively supports students' development and expression of their heritage culture within the school environment. It is important to try to cultivate a climate for respect for cultural diversity, for this type of environment will ultimately be beneficial in allowing all students to not experience the school environment as oppositional to their cultural heritage. This may be achieved through consultation with teachers, coordinating diversity appreciation days, and working with student council/parent–teacher associations and the community to generate schoolwide, community-linked activities that pay tribute to cultural traditions and practices (Bemak & Chung, 2003).

Moreover, school counselors can become advocates for immigrant students by educating other school personnel about the importance of maintaining a culturally supportive environment so that immigrant students can attain personal and academic success (Mitchell, 2005). Counselors can provide in-service training and workshops educating other school personnel (especially teachers) to the diversity of immigrant students, including the differences in their cultural values and beliefs, as well as the impact of acculturative stress on their lives of immigrant youth. Moreover, school counselors must educate American teachers about different styles of teaching and learning that may be more appropriate for immigrant students (Bemak & Chung, 2003). For example, in Haiti, students are taught by the rote method, where they are expected to write down the teacher's words verbatim. This is in contrast to the teaching style of most American schools, where taking notes in class may involve summarizing or simply writing down the basic gist of a teacher's instruction. In addition, many immigrant students have never been exposed to different types of evaluation, such as multiple-choice tests, which

are not commonly used in parts of the world outside of the United States (F. C. Williams & Butler, 2003).

Build Collaborative Relationships With Communities and Outside Support Networks

The community provides critical information for school counselors, who are in an ideal position to be liaisons. Communities provide immigrant students with support, especially since most immigrant groups typically live in clusters, providing a base of social and cultural support (Bemak & Chung, 2003). In a study conducted by P. R. Portes (1999), the immigrant students who maintained optimal performance in American schools established inroads in the community, which provided social and cognitive supports to these students.

School counselors should access community support systems and centers to be able to develop a resource list of services that may aid and assist immigrant youth, who are often in need of support to deal with immigration issues, as well as housing, financial, and employment concerns. This will expand contacts and experiences and offer a set of resources available to the counselor for future consultation.

Provide Ongoing Assessment and Review

Many immigrant students are placed in remedial courses and less rigorous academic and/or vocational classes based on poor testing or language skills. School counselors should challenge these placements and advocate for immigrant students by alerting officials to cultural differences and learning styles, language barriers, and acculturation issues that may impact evaluations and assessments. In determining classroom assignments and educational placements, school counselors can recommend the use of nontraditional measures that may be more accurate in assessing the abilities of immigrant students, as well as document the efficiency of best practices for working with particular students. It is also critical that counselors continue to assess the academic tracking of immigrant students and reevaluate their classroom placements, since their initial placements usually become permanent (Bemak & Chung, 2003).

Become an Agent for Social Change

School counselors also need to be involved in systemic changes beyond the individual level of intervention. Many of the problems and concerns of immigrant students are related to systemic and external forces, such as racism, poverty, and issues surrounding acculturation, rather than internal psychological problems. School counselors might be most effective in assisting their students to deal with these social forces on a systemic level, rather than focusing on self-exploration and assimilation into American culture (Sue & Sue, 2003).

Summary

School counselors can play a critical role in addressing the needs of immigrant students, and generally, in aiding their successful transition to American culture. Several recommendations and strategies have been suggested, some encouraging school counselors to go beyond their traditional roles, which would require additional support and training. It is important to note, however, that the authors' recommendations are only a general overview and that counselors, teachers, and practitioners must be able to assess their students' issues and concerns and then provide appropriate interventions and techniques that address their specific needs. No matter what interventions are implemented, though, school counselors must remember to be culturally sensitive when addressing the needs of immigrant students.

Implications

School counselors must become leaders in the school community in serving the needs of the rising population of immigrant students. In order for school counselors to become prepared for the challenges of their expanded work and roles in the school, changes need to be implemented in counselor training programs. Counselor training programs should emphasize multicultural counseling competencies as an integral part of school counseling curricula, infusing diversity throughout the curriculum instead of in just a single course (Constantine & Gushue, 2003). In addition, course offerings might be expanded to include more intense study of cultural nuances, exposure to different types of immigrants and groups, and introduction to the history of countries from which immigrants (F. C. Williams & Butler, 2003). Counselor education programs also need to consider incorporating a variety of theoretical orientations and approaches in theories courses, beyond the traditional psychodynamic, cognitive–behavioral, and person-centered approaches generally presented. The goals and techniques recommended by these theories may not be appropriate or culturally sensitive to immigrant students (Sue & Sue, 2003).

Beyond training programs, school districts should develop and offer regular in-service professional development programs for practicing counselors to help keep

them current in their knowledge and level of proficiency with immigrant students (F. C. Williams & Butler, 2003).

The immigrant population is large, diverse, and on the rise in the United States due to recent shifts in the demographics of our society. Although there is a great influx in this population, there is a paucity of research that focuses on and highlights the needs and interests of immigrant, especially among youth and youth of color. As such, greater attention needs to be focused on addressing their concerns. Future directions should focus on development of programs and intervention efforts to assist immigrant youth with acclimation and adjustment to the United States and the American public school system. Additionally, the structure of the school system must change to be more inclusive. Research efforts toward curricular reform, including infusing diversity and different cultural perspectives within the curriculum, as well as new teaching methods, should be considered.

VIII
RACIAL HARASSMENT IN AMERICAN SCHOOLS

ROBERT T. CARTER
Teachers College, Columbia University

TAMARA R. BUCKLEY
Hunter College, City University of New York

SCHEKEVA P. HALL
Teachers College, Columbia University

The aim of this chapter is to provide information about racial harassment and discrimination in schools that can be valuable to school counselors, officials, parents/guardians, and other interested persons who work with school-aged people. We have chosen this emphasis on race and have chosen to address racial harassment because we believe that, in our society, social and political systems and institutional practices and policies operate based on racial assumptions and beliefs. Whites, as the dominant group, tend to benefit from educational, social, economic, and political rewards, and more often than not, people of color have less access to educational, social, economic, and political rewards (Bell & Nkomo, 2001; McGrath, Berdahl, & Arrow, 1999; Oliver & Shapiro, 1997, 2006; Sidanius & Pratto, 1999). Unequal treatment in educational systems can lead to tension and hostility related to race, which ultimately can result in race-based stress and perhaps trauma. In the public school system, children and adolescents mat be the victims of such stress from racial harassment.

In this chapter, we begin with a brief description of the roles and functions of public schools and school counselors. Next, we outline legal and psychological distinctions between racial harassment, racially hostile environments, and racial discrimination. We then describe the psychological impact of racial harassment and discrimination on school-aged people, outline factors that influence perceptions of racial incidents, and conclude with recommendations for school officials.

Public Schools

Public schools are charged with lofty goals. Public schools are the institutions intended to create a common preparation for citizens in an increasingly multiracial society (Frankenberg & Lee, 2002). Public schools are required to care for and educate the offspring of every segment of society, including children of every color, race, and culture in the world and every young person, regardless of sickness or well-being, family economic status, language, and religion and regardless of whether the children are able-bodied or have special needs (Texas Association of School Boards). The Texas Association of School Boards' statement prepared on behalf of the National School Boards Association stated,

> [P]ublic schools, as the backbone of our American way of life, foster our ideals of freedom, shared values, and the integration of peoples, and meet the changing needs of our evolving society through a commitment that every child can succeed and become a contributing member of it.
>
> Liberty, democracy, domestic tranquility, economic prosperity, and all the other benefits traditionally associated with American society require an educated people. Ensuring the development of that educated populace is the bedrock purpose of public education. (¶ 1–2)

As socializing institutions, schools help students to become citizens (Sheldon & Biddle, 1998). Effective schools shape students' development, values, and attitudes, and teach them the rules of living and relating to themselves, each other, their families, and society as a whole (Dollarhide & Saginak, 2003). In studies of effective public schools, researchers have consistently described two principles of primary importance: a caring environment and holistic development (School Mental Health Project/Center for Mental Health in Schools [SMHP], 1999, p. 5). Therefore, effective schools promote connections among staff, teachers, students, communities, and caregivers so that young people feel welcomed and respected and so that they make important connections with caring adults. Effective schools are also characterized by consistent, fair decision making and discipline, an environment that encourages academic and personal achievement, realistic but high expectations for all, and high accountability for learning (Travers, Elliott, & Kratochwill, 1993). Education professionals including school counselors, teachers, and administrators are critical for creating caring learning environments that are free from racial bias and harassment. Dollarhide and Saginak (2003) described 16 expectations for professionals in school settings, several of which include instilling core values that transcend cultures, such as justice, honesty, caring, respect, and responsibility; providing a safe bias-free, exciting, fun invigorating learning environment; interacting positively with the community; and instilling respect for traditions and symbols of the country, state, and community.

Although the specific role of public schools varies by state and locality, with the passage of the *No Child Left Behind* Act (U.S. Department of Education [USDE], 2001), all schools in the United States are moving toward greater accountability for educational outcomes. In a climate of accountability, educational professionals are required to account for the relationship of time on task and educational impact (Stone & Dahir, 2004). In this culture of accountability, it is essential for school counselors to remain focused on their primary roles as student advocates and leaders charged with creating safe learning environments that are free from discrimination. The American School Counselor Association (ASCA; 2004) outlines the role of school counselors as student advocates who are responsible for increasing student development in three primary areas: (a) academic, (b) career, and (c) personal and social interactions. Student development is wholly dependent on safe, bias-free learning environments for all students. With increasing numbers of racial/ethnic minority students in public schools, school counselors should become leaders in raising awareness about how to recognize racial harassment and discrimination and to create school-wide strategies that can ensure that all students have an equally likely chance of success.

Racial Composition of Public Schools in the United States

A frequently noted fact is that, with each generation, the United States' population is becoming increasingly multiracial and culturally diverse. This demographic shift has changed the racial–ethnic composition of the nation's elementary, middle, and secondary schools. The USDE racial disparity in number of students and teachers National Center for Educational Statistics (NCES; 2007) stated that, in 2005, 42% of schoolchildren from kindergarten through 12th grade were members of nondominant racial/ethnic groups. More importantly, children from nondominant racial/ethnic groups constitute 80% of total school enrollment in the country's largest school districts (NCES, 2007). In contrast, 86% of new teachers are White, and fewer than 3% of new teachers speak a second language (Darling-Hammond & Sclan, 1996). White/minority teacher ratio has altered little in the past few years as percent of full-time teachers who represent minority groups constituted only 17% of elementary and secondary schools for the 2003–2004 fiscal year indicating only a three percent incline from previous years (USDE, NCES, 2007). The ratio may be problematic because many teacher preparation programs do not adequately prepare student teachers to recognize their own beliefs regarding race, class, and culture and the impact of such beliefs when working with diverse populations (Cockrell, Placier, Cockrell, & Middleton, 1999). Moreover, research suggests that racial groups differ in their perceptions of racially based experiences and incidents (e.g., Kailin, 1999). Whites often view people of color as responsible for acts against them, whereas people of color tend to view the perpetrators as responsible (Kailin, 1999). Racial disparities between school personnel and students may make it more difficult for racial incidents to be recognized and adequately addressed.

Scholars, educators, school counselors, parents, and community representatives have called for changes in school policy and practice as it related to incidents of racial harassment and other forms of racial discrimination. They have challenged the adequacy of current policy and practices aimed at preventing and addressing incidents of racial harassment and teacher training, and they have questioned the racial–cultural composition of teachers and school administrators (Carter, 2000; Darling-Hammond, 2000). These challenges appear well justified, particularly since there are many lawsuits against schools due to how they have dealt with racial harassment (Darling-Hammond; Kozol, 1991).

Although many forms of racial discrimination and harassment have been outlawed as a result of the Civil Rights Movement, many minorities encounter racial discrimination and harassment daily (Feagan, 1991; Landrine & Klonoff, 1996). To understand how powerful these

encounters of discrimination and harassment may be, we will provide several examples of racial discrimination and harassment in the nations' schools.

Incidence and Prevalence of Racial Harassment and Discrimination

Media and publication outlets and researchers report a high incidence of racial harassment and discrimination in the public schools across the United States. These acts impact students from a variety of racial and ethnic backgrounds. In April 2005, Kaufmann (2005), a staff writer from the Gazette, a news supplier in Bethesda, Maryland, reported that four teenage students in Maryland were charged with racial harassment and vandalism for drawing and posting swastikas around the school. In another recent case, the *Rocky Mountain News* (Lindsay, 2005) and *The Denver Post* (Rouse, 2005) reported an incident at a middle school in Denver, Colorado, where a 13-year-old White boy was charged with racially harassing a 12-year-old Black girl by shouting racial slurs, including "n-----," "monkey," and "Blackie Chan." The harasser reportedly was accompanied by two, 12-year-old White girls, who were not charged with "ethnic intimidation." The same victim and her cousins reported that these students also spat on their sandwiches. No charges have been filed because officials have not been able to determine who was involved in the incident. In February 2005, the *Los Angeles Times* (Covarrubiac, 2005) reported that White teens had bullied, harassed, and continually physically attacked African American teenagers at a public school, based on "the color of their skin." No intervention has been taken on behalf of this incident, and community members reported feeling concerned and threatened for their children.

Many additional accounts of racial discrimination and harassment in the national media raise questions about whether these acts have been adequately cited and addressed. For example, both the *Northwest Herald* (Turner, 2005) and the *Chicago Tribune* (Starks, 2005) reported that a much discussed Civil Rights lawsuit in Chicago, Illinois, wherein a child who had been consistently racially harassed began to have suicidal ideation, had been dropped because school officials said they could not prove that the incidents were racially motivated. A similar case appeared in Vermont (Lecuyer & Ceccarossi, 2005) where a teenage girl was suspended from school for fighting. The girl felt wrongly accused, claiming that the fights were racially motivated and that the school is "a hostile environment" (¶ 6). Her mother claims school officials failed to address the [racial] issues and labeled her daughter "aggressive and a danger to the school" (¶ 12). The school reportedly also did not respond to the mother's requests for diversity education in the school.

Fortunately, not all parents have to fight so hard for diversity programs to be implemented in the public schools. A group of school officials in Anne Arundel County, Maryland, has taken allegations of racial harassment very seriously. Throughout several counties in Maryland in 2004, there were a large number of racial incidents in both middle and high schools. *The Baltimore Sun* (Kay, 2005) reported 237 racially biased "acts" that ranged from racial slurs to physical attacks. The preponderance (123) of these acts took place in 16 middle schools, fewer (77) racial incidents happened in 12 high schools, and 37 occurred in 20 elementary schools. Because of the alarming incidence of racial harassment, Maryland implemented diversity programming and a tracking system for reporting incidents.

In 1999, the USDE reported that 25% of students at school had experienced some form of racial harassment such as violent acts, vandalism, or name-calling. The U.S. Department of Education's Annual Report to Congress of the Office for Civil Rights (2007) indicated that the number of specific race-related complaints documented in OCR's yearly reports from 2000 to 2006 fiscal years had declined from the 25% in 1999, and maintained a stable 18%–19% rate of all complaints (USDE, OCR 2007). However, USDE's OCR reported race-related complaints remains the second largest issue affecting American schools below disability complaints. Following this was "multiple" complaints which OCR reports could contain "for example, allegations of both sex and race discrimination (p. 19). Researchers described a similar pattern of harassment and discrimination. Fisher, Wallace, and Fenton (2000) found that, among a sample of 177 African American and Hispanic youth, many reported frequent instances of institutional racism. These instances included being hassled by store personnel and by police officers, presumably because of their race. Asian and White students reported that they were verbally assaulted and excluded from school activities based on their race. All students of color in this study reported that racial incidents were a persistent stressor that had a negative impact on their academic performance. The students of color, with the exception of Asians, perceived that their race contributed to their being wrongfully disciplined, being discouraged from taking advance level courses, and receiving lower grades. Rosenbloom and Way (2004) found that when Black and Latino students perceived teacher preference toward Asian students, they retaliated by harassing the Asian students. Acts of aggression are a common outcome of perceived acts of racial discrimination (Rosenbloom & Way). The negative impacts of racial discrimination and harassment are wide reaching and have been reported to include actions taken by adults and peers both in and outside the school premises. Fisher and colleagues (2000) found that students experienced harassment from teachers, store owners, and police. Harassment and discrimination from peers was

reported both among members from the same racial groups and across racial groups. These selected cases represent a small sampling of a much larger problem that exists in schools across the nation and that affects students and school officials from all racial and ethnic groups. As Dollarhide and Saginak (2003) stated, because schools are systems, all actions within a system affect all members of that system. Young people can be profoundly affected by the values and attitudes that are taught directly or indirectly in that system.

In the following section we will clarify the legal and psychological distinctions between racial harassment and discrimination, followed by a description of the psychological impact of such racial incidents.

Legal Definitions of Racial Harassment and Discrimination

The USDE's (1994) Office of Civil Rights (OCR) wrote,

> Title VI of the Civil Rights Act of 1964 (42 U.C.S. 2000d et seq.) prohibits discrimination on the basis of race, color, or national origin in any program or activity in schools receiving federal financial assistance.
>
> The USDE interpreted title VI as prohibiting racial harassment (Federal Register Vol. 59, No. 47, 1994), which is defined as an incident or environment that denies students the right of an education devoid of discrimination. Specifically, any act that excludes, denies or treats students differently due to race, color or national origin within a federally supported institution or during activities managed by such an institution can be found to violate title VI. Moreover, title VI states that a racially hostile environment 'that is created, encouraged, accepted, tolerated or left uncorrected by a recipient, constitutes different treatment on the basis of race and is in violation of title VI. (¶ 5)

The legal definition of racial discrimination involves situations in which someone is treated differently based on race, such as if a student were denied access to a program or a school solely based on his or her race. Racial harassment is also considered a form of racial discrimination that arises from disparate treatment or impact (i.e., violations of the 1964 *Civil Rights Act*, Title VII).

To determine if an act violates the provisions of title VI, a different treatment standard is applied such that a person must show a legitimate, nondiscriminatory reason for the different treatment. Specifically, the analysis must consider (a) if a student was treated differently, (b) if the treatment occurred within the purview of the school's duties and activities, (c) if the treatment was based on race, and (d) if there was a legitimate, nondiscriminatory (i.e., not a reason given as pretext) basis for the different treatment. If the first three conditions are met and the last condition was not, the institution has violated title VI. The determination of different treatment is distinct from establishing the existence of a racially hostile environment. (A hostile environment may also have aspects of racial harassment, but with schools, specific behaviors and actions also constitute racial harassment, which can be distinct from a racially hostile environment.) A more complete description of specific criteria of racial harassment will be provided later.

To determine whether a hostile environment exists, the analysis must consider if the institution or school officials have engaged in harassing conduct or are responsible for allowing harassing conduct (e.g., physical, verbal, graphic, or written) to occur without intervention. The conduct must be severe, pervasive, or persistent such that it limits a student or adult from taking full advantage of the service or activity offered by the school *and* meets the standard for different treatment noted previously. One of the differences between hostile environments and racial discrimination as previously described is that the harasser does not need to be an agent or employee of the institution because the school or institution has a duty to provide a nondiscriminatory educational environment. To be deemed a racially hostile environment, an investigation must establish that (a) a hostile environment existed and (b) school officials were notified or had knowledge of the environment and failed to redress the situation. To assess for severity and persistence, one must consider the nature, scope, and frequency of the incidents as well as the characteristics of the persons involved, such as their age, grade, race, gender, and developmental level, and the relationship between the parties. These distinctions are important because younger children might be more adversely impacted by verbal or physical assaults than older, more mature students. These factors are also important because they provide information that must be evaluated and interpreted by school counselors and administrators. For example, it might be determined that, in spite of the perspective of the student who was the target, the racial incident did not meet standards for severity or pervasiveness or that it was not racially motivated; therefore, the racial incident may not create a racially hostile environment. The USDE's OCR (1999) issued guidelines for assisting schools in determining racial harassment, entitled "Protecting Students From Harassment and Hate Crimes: A Guide for Schools." The guidelines offer a definition of racial harassment in schools, directions on how to develop policy that responds to harassment, and steps for creating a safe school setting for students.

The OCR defined racial harassment as "harassment that is oral, written, graphic, or physical conduct relating to an individual's race, color or national origin" (USDE, OCR, 1999, p. 16). The acts may be persistent and severe such that they create a hostile environment, which can impede a person's ability to benefit from the school activity or program. The act can involve implied or overt threats of physical violence, physical aggression, assault, property damage, demeaning racial jokes (depending on the circumstances), taunting, racial slurs, use of demeaning nicknames, and other negative remarks. Graffiti and other physical displays that have racial meaning or intent are considered acts of racial harassment. It is the responsibility of the school officials to investigate and determine if particular incidents meet the criterion established for racial harassment. While these criteria and guidelines are helpful, many additional factors influence school officials' abilities to label racial harassment accurately, such as their racial awareness and understanding, proclivity to break the silence about race, and understanding of distinctions among discrimination and harassment. Therefore, adherence to strict legal definitions might possibly obscure such distinctions. Carter (2007) suggested that legal definitions are an important first step in delineating between racial harassment and discrimination, but these definitions provide limited information about perceptions of racial discrimination or harassment and the psychological impact of race-related incidents on the target. To understand the emotional and psychological effects, each act needs to be understood as distinct, rather than interchangeable. According to Carter, racial discrimination often takes the form of avoidance, wherein the target is denied access and opportunity. In schools, therefore, limited access to academic preparation and gifted programs is an example of avoidant racial discrimination. Racial harassment, on the other hand, is a form of hostility that communicates to the nondominant group individual that he or she is powerless and inferior. Although Carter's definitions are not included in legal descriptions, they might help scholars and school personnel understand the psychological effects and differences in race-related incidents.

Distinctions Between Racial Harassment and Discrimination

Both racial discrimination and harassment have negative effects on the target, but the acts are not interchangeable (Carter, 2007; Carter, Forsyth, Mazzula, & Williams, 2005). Distinguishing between these two types of racially based incidents may provide a better understanding of the psychological and emotional effects associated with each. According to Carter and Carter et al. (2005), racial discrimination is a type of avoidant racism. It can be illustrated through behaviors, actions, policies, and strategies that have either the intentional or the unintentional effect of maintaining separation and/or minimizing contact between dominant and nondominant racial groups. For example, in schools, some would argue that limited access to academic preparation and gifted programs serves as an example of avoidant racial discrimination. In contrast, racial harassment "encourages a hostile or dominative environment" (Carter et al., p. 449). Harassment involves "actions, strategies and policies intended to communicate to nondominant racial groups' their inferior status" (p. 449). It is usually overt hostility toward the target that may be communicated through physical and verbal assaults (e.g., slaps, spitting, kicks, racial slurs, jokes), symbolic messages (e.g., swastikas, racist cartoons), or racial profiling.

Both racial harassment (hostility) and racial discrimination (avoidance) can occur on three different levels: (a) individual, (b) cultural, and (c) institutional or systemic through school policy (Carter et al., 2005). The individual level is usually interpersonal. At an individual level, an example of discrimination might involve a person with formal authority excluding another person from an activity based on race and/or the perceived inferiority. A typical example of harassment at an individual level might involve an individual calling another person a derogatory name. Cultural level discrimination and harassment exclusion are societal influences that directly and negatively affect individuals or groups by imposing rules that have the effect of exclusion (e.g., requirements for gifted programs, culturally biased tests as selection criteria for special programs, and advanced placement classes that limit Blacks and Hispanics). Systemic discrimination or harassment relates to institutional practices that are imposed on individuals or groups. Institutional policies and practices would be those that possibly and unknowingly advantage one racial/cultural group over another.

Fisher et al. (2000) contended that institutional and interpersonal acts of racism via discrimination or harassment create psychological distress for students, which negatively impact their academic lives and their senses of self-worth. The harassing acts, which seem far more perverse, are more troubling because they can lead to psychological disengagement from academic achievement and success (Schmader, Major, & Gramzow, 2001). Both racial discrimination and racial harassment have serious psychological outcomes for youth being educated in America.

Psychological Effects of Racial Discrimination and Harassment

Despite the seriousness of racial harassment and discrimination, school counselors and other mental health professionals often do not consider how students might be

affected by these acts. This is troubling considering that racial harassment has been demonstrated by scholars to be involved in many aspects of daily living and in social and economic opportunity and resources (Carter, 2007). Thus, racial harassment and racism are likely involved in the developmental process, life adjustment, and school experiences of all students—White students and students of color. In studies with school-aged children and adults that examined symptoms from racial harassment and other race-related incidents, researchers found that these incidents produced symptoms ranging from daily stress to post-traumatic stress disorder (PTSD; Butts, 2002; Carter, 2005; Johnson, 1993; Taylor & Turner, 2002). Researchers have also found that racial harassment and discrimination impact self-esteem and self-worth (Fisher et al., 2000; Ladd, 1990; Wentzel & Asher, 1995;), depression (Romero & Roberts, 2003; Taylor & Turner), and aggressive behavior (Caldwell, Kohn-Wood, Schmeelk-Cone, Chavous, & Zimmerman, 2004; Rosenbloom & Way, 2004).

Carter et al. (2005) conducted a study to examine the prevalence of racial discrimination and harassment among 262 people of color. Overall, participants from a variety of settings reported almost twice as many incidents of racial harassment (54%) as incidents of racial discrimination (23%). Of the racial incidents that occurred in school settings (primary, secondary, and postsecondary), participants reported a higher incidence of harassment (43%) than discrimination (34%). When examining the psychological impact of these incidents, 75% of the sample reported that these incidents had long-term psychological effects on them, ranging from mild to extreme distress and hypervigilance. The severity of the psychological effect was influenced by the type of event (i.e., harassment or discrimination). On average, 85% of participants who experienced racial harassment reported long-term psychological effects. Conversely, on average, 59% of participants who encountered racial discrimination reported lasting psychological effects. This finding suggests that both types of incidents impact mental health, but harassment seems to engender stronger emotional effects.

Researchers (e.g., Ladd, 1990; Wentzel & Asher, 1995) found that young children who are teased or picked on by their peers at school are more likely to do poorly in school, have low self-esteem, and feel lonely in comparison with children who are not victimized. Similarly, Fisher et al. (2000) reported that 50% of students of color reported that the stress from racial discrimination impacted their self-worth. In a study of White (434) and Black (463) students, Taylor and Turner (2002) found a strong relationship between discrimination and depression for African American students but not among White students. Similarly, in a study of Mexican-American youth (994, both English and Spanish speaking), Romero and Roberts (2003) found a positive relationship between racial distress and depression, with greater levels of racial distress associated with higher levels of depression.

Rosenbloom and Way (2004) found that, for Black and Latino youth, intergroup tension resulted from their perceptions of teacher preferences toward Asians. Latinos and African Americans resented the perceived preference given to Asians, and they harassed them as a result. They reported that the teachers were unaware of their own behavior and the intergroup tensions that it created. These findings may reveal how structural and institutional racism operates and how it may be reflected in interracial group tension. This study also suggests that the stress associated with discrimination can lead to acts of aggression and violence, a finding supported by Caldwell et al.'s (2004) research, which finds that racial discrimination is a strong predictor of violent behavior in young, Black adults.

School Officials' Perceptions of Racial Harassment and Discrimination

Despite the research on psychological impact of racial incidents, school counselors and other mental health professionals have often not received adequate training about how race and ethnicity impact student development and intergroup relations (e.g., Cockrell et al., 1999). Researchers who examined school officials' responses to racism in schools found several themes. First, school officials frequently inaccurately labeled racial incidents, giving more credence to physical acts over emotional and psychological acts; therefore, the psychological impact of racial incidents was rarely a consideration in terms of punishment. Second, school officials tended to focus on individual-level variables such as the perpetrator's personality and disposition, while ignoring the larger sociocultural environment, particularly as it relates to how the racial/cultural climate might influence the prevalence of racial incidents. Third, school officials used race-avoidance strategies to deny the impact of race and race-related issues, which may be related to findings that they often lacked knowledge about how the cultural norms and practices might impact their ability to recognize racially and culturally biased acts.

In a study that examined teachers' and counselors' abilities to distinguish between bullying and other forms of conflict, Hazler, Miller, Carney, and Green (2001) found that school officials inaccurately labeled such acts, often minimizing emotional and psychological harassment and highlighting physical acts. When teachers and counselors examined over 20 scenarios depicting a range of conflictual situations, physical threat or abuse was seen as more severe than verbal, social, or emotional abuse. Additionally school officials were more likely to label physical conflicts as bullying rather than as racial harassment; perceiving an

incident as "bullying" leaves more room for interpretation and leniency for officials and perpetrators. Conversely, labeling an act as racial harassment may have more serious consequences for the parties involved and the school. Furthermore, the idea that social and emotional abuse was less in frequently considered harassment suggested that school officials may be unaware of more subtle forms of racial harassment. Therefore, despite prohibitions against racial harassment, schools officials may not recognize such acts. If school officials are unable to accurately label racial harassment and to model appropriate behavior, school-aged children may be unlikely to do the same.

A second theme that researchers (e.g., McClelland & Hunter, 1992) found was that school officials relied primarily on the perpetrator's report when making a determination about the seriousness of acts of racial harassment rather than considering the larger sociocultural environment. In a study at a small college campus, participants' perceptions of racial harassment were wholly dependent on the harassing behavior, in isolation, with little consideration of possible antecedents contributing to the incident nor of the psychological impact on the target. For instance, the type of harassment directed toward the victim from his or her harassers (e.g., hostile comments or actions) and apologetic actions, excuses, or justifications were important factors for how seriously the act was considered. The researchers found that when covert forms of harassment included an apology, school officials perceived the act as less serious. There was no consideration of psychological or emotional impact. There was also no consideration of how the larger racial/cultural climate might have influenced the acts.

Relying on the perpetrator's account of a racial incident can be problematic because an individual's level of development and biological age impact accurate recognition of such acts. In a study about Puerto Rican children's and adolescents' abilities to recognize discrimination, Szalacha et al., (2003) found that age was a significant variable in an individual's ability to recognize instances of racial discrimination. Adolescents who were between ages 13 and 14 were more likely to recognize racial discrimination than were younger children between ages 6 and 11. It is unclear how actions taken against children would be deemed discriminatory since children themselves might not recognize such acts, and authority figures often misperceive such actions. What is more problematic is that researchers have begun to document that newer forms of racial harassment and discrimination may be more difficult to recognize because of their covert nature (Gaertner & Dovidio, 1986; Sellers & Shelton, 2003) or because they may be imbedded in other types of harassment and or discrimination such as language bias (Goto, Gee, & Takeuchi, 2002) or sexual harassment (Shelton & Chavous, 1999). Racial harassment can also be masked and take the form of microaggressive assaults such as walking in one's path, interrupting a conversation, or using symbols or coded language (e.g., using a play on words to communicate a racial slur). These acts may be both intentional and unintentional (McClelland & Hunter, 1992); as a result, rectifying these behaviors and enforcing policies that protect individuals in schools may be more challenging (Goto et al., 2002).

Recognizing and reporting racial incidents is challenging. Fine (1991, 2000) asserted that discussions regarding race are silenced in the nation's schools. "Inside low-income public schools, there is a systematic commitment to not name those aspects of social life that activate social anxieties" (Fine, 1991, p. 33). In particular, Fine asserted that there is a social pressure to be silent about aspects of education related to race and racism. Thus, when Black, Latino, or Native American students raise issues about social inequities and practices associated with race and racism such as racial harassment, teachers typically shift the topic and silence discussion. School counselors, acting in accordance with their professional training, often employ a similar strategy by focusing on individuals' personal or dispositional characteristics, rather than considering sociocultural or environmental factors, when assessing student problems. Employing this strategy, school counselors do not consider the situational or external impacts of racial harassment incidents nor the stress such events may produce for it targets.

School Officials

Few studies have addressed how school officials' can be more effective in detecting racial harassment, so they can more effectively assist children, parents, and administrators in detecting the same. Rather, more attention has focused on sexual discrimination and harassment within schools (McClelland & Hunter, 1992). We believe that it is more accurate to assess the effects of racial harassment as a possible psychological and emotional injury, rather than primarily focusing on the problematic behavior or disposition of the harasser and victim. The idea here is that racial harassment is a sociocultural environmental event, not a personal limitation that can damage a person (Herman, 1992; Johnson, 1993; Wallace & Carter, 2003). *Merriam-Webster's Collegiate Dictionary* (2003) defined injury as "an act that damages or hurts and is a violation of another's rights for which the law allows an action to recover damages" (p. 1040). We argue that racial harassment disrupts normal functioning and can cause psychological and emotional harm. Therefore, such acts should be understood as situational rather than dispositional. But it is also important to take into account the factors that influence the perception of race-related events in schools.

To consider how the sociocultural environment might influence acts of racial harassment, school officials must have knowledge about issues related to race, racism, and power. But, many educators and school counselors either do not recognize or choose to de-emphasize the significance of race and racism in our nation's schools (e.g., Davidman & Davidman, 1988; Fine, 2000; Milk, 1994). This is disturbing, given that in some American cities the majority of teachers are White whereas students of color compose a larger segment of the student enrollment. Cockrell (1999) examined teacher preparation programs and found that many student teachers did not understand how their own beliefs about race, class, culture, and other demographic characteristics impacted their work with diverse populations.

In describing the racial climate in American culture, Verkuyten, Kinket, and Van Der Wielen (1997) stated that if school leaders and staff reflect traditional American racial beliefs and attitudes, especially the belief that racism is a thing of the past, then they will likely attribute racial acts to individual aberrations and minimize possible racial undertones in the larger environment. Sleeter (1989) observes that White teachers who are often the majority seldom see racial oppression. White educators may also have difficulty engaging in discourse about race because they generally do not see themselves as members of a racial group (McIntosh, 1988, 1998). To the extent that their own racial group membership is de-emphasized, their awareness regarding the impact of racism on their own and others psychological development is also de-emphasized. Consequently, they do not understand or appreciate the role and significance of race and racism, nor are they aware of how racial harassment and discrimination impact the lives of students of color (Sleeter, 1989). In fact, Kailin's (1999) study finds that many liberal White teachers blamed Black students for racism. It seems reasonable to conclude that it is difficult to be socialized in this society without internalizing positive beliefs about Whites and negative attitudes about people of color. To offset standard racial socialization practices, educational training programs need to equip school leaders with the knowledge, attitudes, and skills to recognize racial issues such as racial harassment (Carter, 2000).

In the following section, we will use racial identity theory, a race-based approach to education (Carter, 2000), as an approach for increasing knowledge and awareness about race and racial issues. Because racial identity is an inclusive paradigm that incorporates and values all racial–cultural perspectives, the theory provides a way for all Americans, including White Americans, to participate in the dialogue about race, racial harassment, and racism in the nation's schools. Racial identity theory proposes that an individual's ascribed racial group (e.g., White, Black, or Latino) does not tell us about the nature of his or her psychological orientation to race. Indeed, more important from a racial identity perspective is an individual's psychological perspectives or perceptions about race (i.e., a person's racial identity ego status). Each person's racial identity ego status will have consequences for the way he or she interacts with people from his or her own group and from other racial groups. An individual's racial identity ego status might also impact the manner in which institutional practices and policies are established and followed. For example, the school principal's level of racial identity might impact whether he or she believes it is important to hire teachers from visible racial/ethnic groups. Incorporating racial identity theory as a framework for defining, understanding, and addressing issues of racial harassment in school systems offers an important and complex mechanism with which to develop and advocate for prevention and intervention programs. In the next section, we will briefly describe two racial identity models.

Racial Identity Theory and Education

The term *racial identity* refers to one's psychological response to race; it reflects the extent to which one identifies with a particular racial and cultural group and how that identification influences perceptions, emotions, and behaviors toward people from other groups (Carter, 1995). There are several models of racial identity. In this chapter, we describe the White and people of color racial identity models, originated by Helms (1990) and Thompson and Carter (1997), respectively. Each model comprises several distinct racial identity ego statuses, which are theorized to be aspects of personality. Each racial identity ego status comprises a constellation of beliefs, thoughts, emotions, and behaviors based on an individual's membership in a socially ascribed racial group. Although each racial identity ego status is presented separately, at any one point, an individual may endorse attitudes from each status, with one predominant status that has the largest influence on an individual's worldview (Helms & Piper, 1994). Therefore, racial identity is not a stage model wherein an individual is located in one status, but rather individuals have components of each status in their personality structures. An individual can develop sequentially from less differentiated, externally derived, and less mature status influences to more internally based, complex, and differentiated mature status influences, and the influences of statuses may change over time.

The following paragraphs provide an overview of the two models of racial identity for people of color and Whites. Racial identity models for people of color are described together; subsequently, the White racial identity

model is described. We encourage the reader to consult other works for more detail (Carter, 1995; Carter & Goodwin, 1994; Carter & Pieterse, 2005; Helms & Cook, 1999; Thompson & Carter, 1997).

People of Color Racial Identity Model

In the first status of the people of color model, Conformity, an individual's worldview is consistent with dominant European-American cultural beliefs, for example, idealizing American culture. Race has limited personal or social meaning, rather social status is presumed to be determined by personality and ability. Individuals characterized by this status view people of color from a stereotypic perspective that is consistent with the dominant societal view. This person is likely to attribute racial incidents solely to personality rather than to see possible interactions with race. The second people of color identity status, Dissonance, is characterized by emotional and psychological confusion, triggered by a series of emotional blows that begin to shift an individual's externally held beliefs regarding race. An individual in this status would probably be unsure whether an event could be attributed to racial harassment or to personal conflicts. In the third status, Immersion–Emersion, an individual attempts to discover his or her racial–cultural heritage and begins to idealize his or her own racial–cultural group, while denigrating White culture. This individual would attribute racial incidents to racism and racial harassment. The fourth people of color identity status, Internalization, is characterized by an inner pride regarding an individual's own racial–cultural heritage and an acceptance of other racial–cultural groups. The final status, Integrative Awareness, is characterized by an active and visible support of nonracist perspectives and often involves social and political activism. In the final statuses an individual would be able to discern racial harassment and understand the differences between personal conflicts and racially based incidents.

White Racial Identity Model

Helms' (2001) theory of White racial ego identity proposes six statuses (Contact, Disintegration, Reintegration, Pseudo-Independence, Immersion–Emersion, and Autonomy). The first three statuses (Contact, Disintegration, and Reintegration) represent the abandonment of racism, and the second three latter statuses (Pseudo-Independence, Immersion–Emersion, and Autonomy) represent the establishment of a nonracist White racial identity. In the first status, Contact, an individual views the world as color-blind; therefore, race has little or no personal meaning. This person might attribute school-based incidents to personal issues rather than to race. The second status, Disintegration, is initially characterized by limited consciousness of one's Whiteness, with a subsequent recognition of racial inequalities, racially based social rules, and pressure to adhere to the color line in social and institutional situations. To cope with this new awareness, which is often conflictual, individuals' become defensive, convincing themselves that racism is a remnant of the past. This person would likely be unsure whether an event could be attributed to racial harassment or to personal conflicts but would tend to not see the role of race. In the third status, Reintegration, individuals adopt a belief in White racial superiority and non-White inferiority. An individual in this status reinterprets information to fit stereotypes commonly held in American society. This individual would tend to attribute encounters with race to the person of color as being overly sensitive and would deny that any action was the result of racism or racial harassment. In the fourth status, Pseudo-Independence, an individual reexamines externally derived information and questions whether Blacks and other people of color are innately inferior to Whites. Individuals also begin to understand that Whites have responsibility for racism. In Immersion–Emersion, the fifth status, an individual begins the emotional process of self-exploration and discovery, and he or she seeks out other Whites for discussions about race. This process often leads to positive, nonracist feelings about being White. In the final status, Autonomy, an individual has developed a new meaning of Whiteness, no longer oppresses or idealizes people based on group memberships, and is primarily able to abandon cultural, institutional, and personal racism. People whose racial identity is influenced by the final three statuses would be able to discern racial harassment and understand the differences between personal conflicts and racial ones. But the distinctions become more clear as the Immersion–Emersion and Autonomy statuses have more influence over one's racial identity ego structure.

In summary, racial identity is a psychological resolution within each person's personality that serves as a lens and filter for racial and cultural knowledge, experience, behavior, and emotion. Racial identity ego status resolutions provide a complex approach for understanding individual development and intergroup interactions. Racial identity sheds light on one's self-understanding, affect, perceptions, ideas, and behaviors toward those who belong to the same or different racial groups. By using racial identity constructs, the meaning of race does not focus entirely on physical markers such as skin color and physical features. Group membership based on demographic markers, alone, is a misleading indicator of whether a person values his or her ascribed racial and cultural group.

Racial Identity and School Applications

We contend that the variation in response to one's racial group membership, namely one's racial identity, has implications for school counselors, educators, students, administrators, and policy makers who address complaints of racial harassment. As school counselors and educators attempt to bring attention to the psychological, educational, and cultural needs of the members of racial groups, they typically do so with little recognition that individuals may vary in response to their racial group membership. We believe, however, that understanding that individuals respond in a variety of ways to their race is crucial to helping school counselors and other staff in dealing with encounters with racial harassment in schools. For example, it is important to consider that people view incidents through their particular views of race and culture.

School counselors who use less mature racial identity statuses as a lens to filter racial cultural information believe that all students are the same and that racial and cultural differences do not impact school events and interactions. Rather, they view students and staff from a universal perspective. Therefore, if a child reports a racial incident, school counselors operating at a low level of racial identity development would tend to blame the victim by viewing the child as lacking appropriate parental guidance; having an impoverished home life, social background, or community; or being overly sensitive about race. School counselors in this group might also believe that they hold high standards for protecting students from harassment and that they work for the interest of all children, a belief that is contrary to empirical studies of teachers' racial perceptions (Darling-Hammond, 2000). Counselors who hold such racial identity attitudes will employ seemingly racially sensitive counseling strategies when issues of racial harassment occur, yet by treating each complaint as an isolated event, he or she is not recognizing the possible patterns. This approach limits one's ability to see any systemic patterns or to discern that the events may be related to racial animus or to prior or current circumstances. Although these counselors may attempt to understand people in terms of racial–cultural distinctions, their own limited racial learning and perspective may distort their understanding. For instance, a White person who holds less mature racial identity attitudes may not recognize how he or she using his or her own background and experiences as the standard for other racial groups (Pseudo-Independence). Likewise, a person of color who holds less mature racial identity attitudes may distort information in favor of his or her racial group and be incapable of being balanced in his or her understanding of complex racial-cultural relationships and incidents.

The more mature and internally defined racial identify statuses are Autonomy and Immersion–Emersion (White statuses) and Internalization and Integrative Awareness (people of color statuses). These statuses are characterized by an internalized positive view of self as a racial being with a deeper understanding of racial and social–political issues in society. School counselors who endorse these racial identity attitudes recognize the complexity of relationships between schools, society, students, and teachers. They also recognize how each student is shaped and influenced by society, school, and teachers. For school counselors endorsing more mature racial identity ego statuses, they can identify racial–cultural patterns in student experiences and uncover subtle aspects of the reported incidents. School counselors who express these racial identity statuses work actively to expand their own knowledge and understanding of race and culture and integrate new knowledge into their work in meaningful ways. The school climate created by school counselors characterized by the more internally based racial identity statuses is one of support and confirmation of varying racial and cultural groups. "They create a [school climate] that is collaborative, purposeful, and supportive" (Hollins, 1999, p. 192).

Students, like counselors, understand the world and interpret classroom and school events through their own level of racial identity development. Students learn about who they are as racial/cultural beings from primary socializing agents (e.g., family, schools, and community) and distal socializing agents (e.g., television and other media). Primary socializing agents are the most powerful forces early in children's lives for learning which groups are valued. These messages are often internalized by students and acted on by school officials. Fine (2000) observed,

> [I]nside schools . . . students who carry their genders, their race/ethnic identities, and their social class biographies into school "become"—that is, are seen as and see themselves as—bright or not; talented or deficient, filled with potential or filled with needs. I seek to understand the social psychological processes by which institutional hierarchies, patterned by race and ethnicity, gender and class, come to be embodied by students so that faculty and students can be so sure about who is promising and who is not. (p. 35)

For example, students functioning from different statuses of racial identity may have different reactions to the same educational environment. White students in the Contact or Reintegration statuses may experience an educational environment that supports traditional American cultural values as affirming. Similarly, a Black or a Latino student in the Conformity status may initially feel comfortable with a counselor who believes that American culture should be the conduit through which all learning and

experience should take place. In contrast, students of color and White students who possess more advanced racial identity ego statuses may view this attitude as diminishing their race and culture; thus, they may experience such an educational environment as hostile and unwelcoming.

Racial identity development can also influence interpersonal interactions, group dynamics, and organizational policies and practices. The role of racial identity statuses in relationships, systems, and groups is affected by power and authority. Individuals who have more power and authority will exert greater force in terms of relationships. Racial identity researchers and theorists have delineated four types of relationships that can be used to understand interpersonal connections, groups, and organizational dynamics (Carter 1995; Helms, 2001; Thompson & Carter, 1997). The relationship types are regressive, parallel, progressive, and crossed. In a parallel relationship, both participants are at the same level of racial identity development and express the same types of attitudes about their own race and others racial groups. Such a relationship would be self-validating and socially confirming in that the individuals hold the same view and process information in a similar manner (Carter & Helms, 1992). If the victim and school official had a similar racial identity level, even if they were from different racial groups, they would likely be in agreement about what happened and how the incident should be addressed.

In a regressive relationship, the person with less formal power and authority (e.g., the student) has a more mature and advanced racial identity than the person(s) with more power and authority (e.g., school counselor or principal). This type of relationship often produces anxiety, resistance, and anger in the person with less power, who may believe his or her perspective is being disregarded, devalued, and dismissed. In a crossed relationship, similar to a regressive relationship, the participants have opposite racial identity ego statuses, with the person in power having a more mature racial identity than the person with less power. The progressive relationship is the most productive. In this relationship, the power holder(s) has more advanced racial identity status development. By virtue of the more developed status the person in authority can help the less powerful participant(s) learn, grow, and understand issues about race and racial identity. Consider this example of a progressive relationship. Black students engage in verbal name-calling directed at an Asian student. The Asian student lodges a complaint to the school counselor, a White professional in the Autonomy status. The school counselor recognizes that the Black students, even though they may not hold institutional power, were harassing the Asian student. The counselor acquaints the harassers with the policy and the consequences of violations, warns them about violating such policies, and suspends them.

Extending the racial identity relationship dynamics to groups and organizations is extremely powerful and represents an important advance in our abilities to understand race related issues in organizations and groups. As Thompson and Carter (1997) pointed out,

> [I]ndividuals who comprise groups and organizations influence others according to the racial identity schema and conversely, are influenced by the racial identity statuses of those who hold power within these setting. Importantly, the racial identity of those in positions of influence contribute to the racial climate of a particular group or organization. (p. 29)

The racial climate refers to how open the group or organization is to addressing and resolving intra- and interracial conflicts and whether group members are able to encourage and facilitate the development of positive race relations (Helms, 1990). The definitions and dynamics are relevant irrespective of the particular racial group's members who may be a part of the organization.

In groups and organizations, racial identity coalitions may be formed on the basis of racial norms and perceptions of power. Coalitions operate based on how comfortable people feel in part due to the proportion of White people to people of color in the group or organization. Whites are more conformable when they are in power and outnumber people of color, and Blacks and self-identified people of color's comfort derives from equal number of Whites and people of color in the organization or group.

Understanding how the racial identity model applies to educational organizations such as classroom, schools, and school districts is important, particularly since these settings often have racial issues, which may become more apparent as those in positions of power are predominantly White and increasingly larger segments of parents and students are people of color. Racial climate plays a powerful role in shaping individual behavior within groups. School counselors and administrators are guided by the racial norms and expectations of those who have authority for the individual school and the school district. For example, if the racial climate of a school or district is characterized by racial denial and stagnation, parents, teachers, and community members who attempt to promote change are likely to have limited success because they are attempting to change their organization's racial norms. If group or organizational leaders avoid and minimize racial-related issues and conflicts or if they confront and address racial issues openly, then their behavior sends signals to group and organizational members about the racial climate and about what behavior is acceptable.

Organizations are usually plagued by stagnation and ambivalence about addressing race (Carter, 2000). Many organizations and schools claim to be concerned with improving race-related problems and conflicts, such as racial incidents or harassment, high rates of suspensions of students of color, disproportionate number of students of color referred to special education, and so on. However, many school leaders will nevertheless establish polices and procedures that ignore or even promote these very problems. Fine (2000) pointed out that race is a critical element in institutional and organizational life in our schools. However, she argued that rather than focus on people of color that we shift our attention to how Whiteness is created and maintained as an unseen process.

> First . . . whiteness, like all "colors," is being manufactured, in part, through institutional arrangements. This is particularly the case in institutions designed "as if" hierarchy, stratification, and scarcity were inevitable. Schools and work, for example, do not merely manage race; they create and enforce racial meanings. Second, in such institutions, whiteness is actually co-produced with other colors, usually alongside blackness, for instance, in symbiotic relation. Where whiteness grows as a seemingly "natural" proxy for quality, merit, and advantage, color disintegrates to embody deficit. Third, whiteness and color are therefore not merely created in parallel, but are fundamentally relational and need to be studied as a system; they might, in statistical terms, be considered "nested" rather than coherent or independent variables. Fourth, the institutional design of whiteness, like the production of all colors, creates an organizational discourse of race and a personal embodiment of race, affecting perceptions of self and "others," producing individuals' sense of racial "identities" and collective experiences of racial "tensions," even coalitions. Once this process is sufficiently institutionalized and embodied, the observer, that is, the scholar, can easily miss the institutional choreography, which has produced a stratified rainbow of colors. What remains visible are the miraculous ways in which quality seems to rise to the glistening white top. (pp. 38–39)

As we can see from Fine's (2000) example, aspects of race and its systemic effects and processes may go unnoticed; our attention may need to be on who benefits in our educational system and how, not just on who is excluded and why. Nevertheless, the example illustrates the use of racial identity analysis in group and organizational contexts. Another example is offered for how racial identity might impact an organization. Since groups are composed of individuals, it is possible for the individual levels of racial identity to combine and reflect the views of the group. For example, in a given middle school, a group of teachers may possess a low status of racial identity (e.g., Contact, Pre-Encounter, Disintegration, and Encounter). It is likely that their individual attitudes will combine to form a coalition (see Helms, 1990) that will become the predominant perspective of the school.

In this example, racial conflict or acts of racial harassment directed at students of color may be understood in terms of individual student personality issues rather than as violations of the law and school policy. Counselors who do not belong to the prevailing racial identity coalition, particularly those who may function from more developed statuses (e.g., Autonomy and Internalization) may feel marginalized and helpless in their efforts to enlighten their colleagues. It is likely that the school environment will be stressful, students will feel the frustration of their teachers, and the school and educational climate will not be conducive to learning. This circumstance is an illustration of regressive racial identity coalitions, since the groups interacting in the school are functioning from very different statuses of racial identity and the group with the greatest influence is characterized by lower statuses.

Recommendations for School Counselors

The increasing number of children from diverse backgrounds in the United States suggests that school counselors and administrators should gain knowledge about how to best meet the needs of these children and their families (Holcomb, 2004). This is particularly important because racial minorities continue to be negatively impacted by race-based harassment (Carter et al., 2005; Carter & Helms, 2002; Juvonen, Nishina, & Graham, 2000). In the following sections, we offer several recommendations based on literature and models presented earlier. These recommendations consider the growing movement in school counseling toward developing a balanced program in prevention and intervention programming.

Intervention Strategies

First, school officials should gain knowledge about the legal statutes and codes for recognizing and addressing allegations of racial harassment and discrimination. In this way, they will be poised to adequately address allegations of racial harassment. As described previously, the OCR established procedures for investigating incidents of racial harassment. Although this office was established to maintain students', teachers', and administrators' civil

liberties, school officials would benefit from establishing their own guidelines that are specific to racial harassment and discrimination rather than grouped with other types of discrimination and harassment (sexual harassment, typical bullying, etc.). In developing their own guidelines, schools might develop a detailed process for reporting and resolving incidents of racial harassment. First, schools might develop procedures to adhere to when recording a complaint (i.e., what to look and listen for in the complainant's reactions and how to determine if the victim needs additional services such as psychological counseling, mediation, or conflict resolution). Second, school officials should be aware of complainant's rights to confidentiality. Third, a formal investigation should be launched.

Prevention Strategies

Ideally, schools would develop preventive programming aimed at increasing knowledge and awareness about race, before problems ensue. For example, Vermont recently established a set of guidelines and procedures for addressing instances of racial harassment (USDE, OCR, 1999) that includes school- and community wide interventions aimed at improving the racial climate of their schools. As mentioned earlier, Anne Arundel County, Maryland, has implemented systematic reporting and diversity programs to deter racial incidents at their schools. While this strategy may be in reaction to earlier events, it may also prevent such acts.

The most effective method for combating racial harassment and discrimination, however, is to develop prevention programming that targets the entire school population and that is aimed at increasing awareness and knowledge about race. Before training students, school officials must increase their knowledge. Therefore, professional development for school counselors should include training about race, ethnicity, racial identity, and power. At a minimum, this would require that school counselors attend several conferences on race and seek continuing education training and in-service training on the topic. Training that increases self-awareness, including the complexity of racial identity, will likely lead to a deeper understanding of the nuances of race and racial identity and how they impact the self and others. These requirements will be most successful if all school officials engage in the training. A school counselor is likely to face resistance if other school officials in the system have not had similar training. To ensure that the information is translated into practice, a consultant would be engaged to provide consultant-centered advice related to curriculum development, clinical work, and advocacy. The consultant might also meet monthly with school officials to discuss ways that race and power have been implemented into each person's respective role and practices; regular meetings are essential for creating lasting change and for expanding the organizational culture to include discussions of race and power. Expanding the culture will also increase school officials' comfort in having race-related discussions with students. For school counselors, it is even more imperative to develop skill in discussing issues related to race. Without a level of cultural comfort, students from diverse backgrounds may be unlikely to report acts of racial harassment and discrimination. In writing about how to create identity safety for students of color, Markus, Steele, and Steele (2000), stated,

> [C]lassrooms should be a climate in which group differences—the difference in the local worlds experienced by minority and non-minority students in the setting—is commonly recognized by all and used in achieving a respectful understanding and valuing of all students. (p. 252)

A first and critical step in increasing students' awareness, knowledge, and comfort talking about race, racial harassment, and discrimination is for school officials to begin openly having conversations about these topics. Therefore, school officials might consider implementing a school wide assembly where an expert in the topic discusses these issues with students. Second, school counselors can provide in-class guidance curriculum related to race and power; counselors and teachers can use video and other media on this topic that can appeal to students with varying learning styles; and school counselors and teachers should integrate race and culture into the larger school wide curriculum.

We believe that if students and school officials gain knowledge and awareness about race and power, racial incidents will be more readily reported and claims of racial harassment and discrimination will be adequately addressed. In this way, the unfortunate sequelae of racial incidents such as diminished self-esteem, depression, and negative academic performance will be minimized.

IX

THE ROLE OF ETHNIC IDENTITY IN THE PRACTICE OF SCHOOL COUNSELING

SHANNON CASEY-CANNON

California School of Professional Psychology
Alliant International University

Multicultural programming and culture-based initiatives have recently become central to many school counseling programs (Bass & Coleman, 1997). Educators and psychologists better understand how youth view their cultural selves, including the intrapersonal and interpersonal psychological processes related to exploring and committing to a cultural or ethnic identity (Phinney, 1992; Sellers, Rowley, Chavous, Shelton, & Smith, 1997; A. Thernstrom & S. Thernstrom, 2003; Yeh, 2004). Racial and ethnic identity has been defined as a "type of group identity that is central to the self-concept of members" of an ethnic group (Roberts et al., 1999, p. 303) and as the significance and meaning that individuals attribute to membership in a certain group (Sellers et al., 1997). Development of positive ethnic identity has been related to numerous developmental outcomes, including psychological well-being, self-esteem, career development, and most notably for schools, academic achievement in young people (Dubow, Pargament, Boxer, & Tarakeshwar, 2000; Rumbaut, 1994; Yasui, Dorham, & Dishion, 2004). Theories regarding youth ethnic identity development are supported by research that acknowledges and celebrates diversity in school settings.

Counselors are charged with helping students develop positive and "comprehensive" identities based upon the many cultures to which they belong. Operating within larger systems of neighborhoods, school districts, and society, counselors advocate for students both individually and collectively. Empowering minority students helps to foster dynamic and accepting schools and communities where all students have the opportunity to thrive (Fusick & Bordeau, 2004; Yeh, 2004). This chapter summarizes the literature on ethnic identity, provides a framework for ethnic identity development within broader sociocultural contexts, and discusses strategies and evidence-based interventions for "counselor-assisted ethnic identity development" (Fusick & Bordeau). A case example of school-based counseling with a high-school girl immigrating to the United States from Peru is presented as a highlight of the encouragement of ethnic identity development.

Schools have become reflections of growing diversity in the United States, with an increase in the number of children from diverse ethnicities, bicultural backgrounds, and immigrating families (U.S. Bureau of the Census, 2001). The changing ethnic makeup of tomorrow's generations is accompanied by shifts in cultural values, customs, behaviors, and lifestyles (Yeh, 2004). To meet the demands of growing, dynamic student populations, counselors tailor interventions and programs to promote emotional, social, and cognitive growth of a diverse range of students (Baker & Gerler, 2001). In their National Model of School Counseling, the American School Counseling Association (ASCA; 2003) mandated that schools ensure every student has equitable access to school counseling programs. That includes providing comprehensive services to help students acquire knowledge, attitudes, and interpersonal skills necessary for understanding and respecting oneself and others (ASCA). Specifically, the ASCA advocates for facilitating minority and nonminority exploration of ethnic identity through purposeful programs in schools.

> School counselors would do well to integrate knowledge, awareness, and skills related to adolescents' ethnic identity development, acculturation experiences, perceptions of mattering, and overall wellness into their comprehensive counseling programs in order to meet the diverse needs of both minority and nonminority students. (Rayle & Myers, 2004, p. 89)

That includes shifting traditionally Eurocentric views of educational standards to multiculturally informed views of education, perceiving individuals who differ from traditional Western norms as positively adapting within new contexts.

Counselor-Assisted Ethnic Identity Development

During preadolescence and adolescence, youth make social comparisons to explore their identity relative to others in their social world, including family, peers, and authority figures such as teachers (Steiner & Feldman, 1996). One way school-aged children categorize themselves and others is according to race and ethnicity. Students begin to encounter their racial or ethnic makeup and affiliation, a process referred to as "racial identity" or "ethnic identity development" (Phinney, 1992; Sellers et al., 1997). Typically, the term *race* or *racial identity* has been used to describe the genetic or biological markers that differentiate individuals, with an additional focus on sociopolitical implications related to marginalizing groups based on visible group membership (Betancourt & Lopez, 1993; Helms, 1994; Ponterotto & Pederson, 1993). The broader and more widely accepted term *ethnicity* or *ethnic identity* has identified groups of individuals united by shared values, worldviews, and behaviors, who may have a similar heritage (Betancourt & Lopez; Phinney, 1990).

Historically, research about ethnicity for children focused on stereotyping, racism, and discrimination; more recently, literature focuses on the psychological relationship of minority group members with their own group (Holcolmb-McCoy, 2005). Distinguishing ethnic identity from other constructs such as racial identity and acculturation has been complicated and difficult (Coleman, Norton, Miranda, & McCubbin, 2003). Many authors, however, have elected to use the terms interchangeably to symbolize an individual's understanding of his or her cultural self, including self-identity, perspectives on group membership, and perceptions on how his or her group is perceived by others (Phinney, 1990; Sellers et al., 1997). Educators and psychologists focus less on disputing the nuanced understanding of terms such as *race* and *ethnicity*, and instead concentrate on the dynamic and changing nature of cultural socialization, in particular, for minority populations (Yeh & Hwang, 2000).

Regarding the development of ethnic identity, ecological models suggest that self-understanding and behavior result from ongoing dynamic interactions between individuals and their environment (Bronfenbrenner, 1979). Thus, identity development does not occur in a vacuum; it is part of a much larger system that integrates diverse layers of influence, including societal, neighborhood, school, and family influences (Yeh, 2004; Zayas, 2001). Ethnic identity is mutually constructed, built upon contacts with one's own and other cultures across the lifespan (Aldarondo, 2001; Yeh & Hunter, 2004). The transmission of cultural values and culturally appropriate behaviors, thoughts, and emotions is critical to the identity development process (Yeh & Hunter).

The context is not seen as an external driving force, but rather, it gives meaning to one's behaviors (Bronfenbrenner, 1979). The meaning that youth attribute to membership in a specific group or groups helps to form self-perceptions (Sellers, Chavous, & Cooke, 1998). Distal and proximal systems, such as neighborhoods and families, differentially influence the meaning associated with being a member of a certain ethnic group. That process of coconstruction of meaning has important ramifications for the development of identity, as patterns of socialization likely vary by cultural context (Yeh & Hunter, 2004). A student's identity, thus, may shift based upon the surrounding cultural context and the meaning attributed to being part of a cultural group within that context. For example, a student recently immigrating to America from Vietnam and attending a predominantly European-American high school might encounter others' perceptions of what it means to be Vietnamese, as well as what it means to be an immigrant. The meaning attributed to being from a certain ethnic group, by oneself and by others, provides a context for identity development (Yeh & Hwang, 2000).

Based on ongoing interactions, ethnic identity development is a multidimensional and dynamic process that shifts across time and context (Markus & Kitayama, 1991; Yeh & Hunter, 2004; Yeh & Hwang, 2000). Selves are continually adapting and changing in ways that vary for each individual and are based on previous experience and support for exploration in their community (Yeh & Hunter). Bridging across diverse contexts can be difficult for students (Yeh & Drost, 2002)—in particular, when there are cultural conflicts between one's own culture and the majority or dominant culture, which is frequently privileged by race and economic status. Identifying and confirming possible selves is a difficult process that deserves acknowledgment from psychological support staff (Markus & Kitayama, 1991). Rather than being marginalized or degraded for different values, students deserve recognition for the complicated and "stressful" process of negotiating across diverse contexts (Coleman, Casey-Cannon, & Fillingame, 2004).

Many authors have found that ethnic identity development is strongly influenced by discrimination, classicism, and unequal access to opportunity (Fusick & Bordeau, 2004). If a child is seen by educators as a stereotype, rather than an individual, then racism takes its psychological toll (Zayas, 2001). Children might feel estranged from

themselves when they are defined by external notions, rather than innate self-definition (Zayas). Aldarondo (2001) observed that "experiences with racism, especially if this is internalized, may prompt some confusion related to personal identity" (p. 246). Students may experience conflict between what they experience to be true about themselves (e.g., they enjoy and excel in math) and what society says about students from their cultural group (e.g., they lack mathematic ability). It is likely that racism and discrimination lead to a stress response and evoke attempts at coping with the discrimination (Zayas). Thus, youth use a range of strategies to cope with cultural conflicts; some are more adaptive than others and some may relate more strongly to achievement (Coleman et al., 2004; Coleman, Casali, & Wampold, 2001).

The process of developing ethnic identity may be more complex for biracial or multiethnic populations (Rayle & Myers, 2004). In addition to conforming to mainstream social norms, students from multiethnic backgrounds may believe that they must identify with one group or another in order to consolidate the persons they are becoming (Aldarondo, 2001). Multiethnic students may struggle with creating an integrated sense of cultural identity based on compatible—or sometimes conflicting—norms and values (LaFromboise, Coleman, & Gerton, 1993). Development of ethnic identity may also be more complicated for immigrant students, who might encounter discrimination on a systemic level or feel stigmatized or stereotyped by society (Yeh et al., 2005). As such, immigrant students might rely more heavily on social support networks as they work to balance multiple aspects of the self (Yeh et al.).

Ethnic identity searching has been related to psychological well-being (Phinney, 1990; Rayle & Myers, 2004), academic achievement (LaFromboise et al., 1993), school experiences (Thernstrom & Thernstrom, 2003), and self-esteem (Holcolmb-McCoy, 2005; Phinney, 1992) in minority and nonminority populations. Research suggests that ethnic minority youth are at higher levels of risk for mental health problems, school problems, and school dropout (Dubow et al., 2000; Yasui et al., 2004). Thus, developing a positive sense of one's cultural self is critical for youth. Self-awareness and understanding contributes to maximizing student potential and well-being. School counselors serve as agents of change when they help students explore ethnic identity (Holcolmb-McCoy), facilitate negotiation of diverse contexts, and provide choices for defining who one wants and chooses to be (Fusick & Bordeau, 2004). Students benefit from understanding ethnic affiliation, including knowledge of cultures they seek to integrate, developing positive attitudes toward multiple groups, and understanding core values related to the groups to which they belong (LaFromboise et al.; Yang, Coleman, & Cho Kim, 2003).

Theories of ethnic identity development suggest that students internalize cultural messages about their ethnic group; how those messages are interpreted directly relates to self-identity, psychological well-being, and school performance (Holcolmb-McCoy, 2005; Thernstrom & Thernstrom, 2003). When messages toward one's cultural group are perceived to be favorable, or when there is minimal conflict in identity development, minority students have more support to excel and build a positive sense of self (Aldarondo, 2001). Even in the presence of external barriers such as racism and discrimination, positive racial identity serves to assist minority adolescents in overcoming obstacles present in hostile environments, which contributes to improved educational involvement and achievement (Miller, 1999; Spencer, Noll, Stoltzfutz, & Halpalani, 2001). This research supports that ethnic awareness and group affiliation are protective by facilitating the development of positive self-beliefs and personal potential.

Other theorists hypothesize that when messages are perceived as less than favorable, students might underperform relative to peers from majority cultures in spite of equivalent levels of motivation and ability. Students may "disidentify" with school or undervalue education, choosing to redefine their identity around pursuits other than academics (Steele, 1997; Wilson, Cooke, & Arrington, 1997). Thus, social conditions degrade student's perceptions of the self and create barriers for active engagement. Research evidence for a direct relationship between racial and ethnic identity and academic achievement is mixed, although recent attempts to clarify how identity and achievement are related show much promise (Coleman et al., 2004).

The Role of the School Counselor

It is clear from the research that students benefit from assistance in developing a positive identity (Phinney, 1992). "Counselor-assisted ethnic identity development" (Fusick & Bordeau, 2004, p. 110) has been described as a process of promoting positive ethnic identity development, helping students to resolve identity conflicts, and providing environments that support growing diversity (Aldarondo, 2001; Fusick & Bordeau). Based in relationships built on trust and mutual respect, interactions with multiculturally competent counselors empower young minority students to better negotiate cultures and take positions of strength (Yang et al., 2003). Allowing for exploration of ethnic identity in a nonjudgmental environment, through groups, assignments, and programming is critical (Phinney, 1992).

Research has identified many ethnic minority students as reluctant to seek counselor assistance due to fear of being stigmatized or of linguistic barriers (Yeh & Inose, 2002). Other research suggests that minority students report

receiving less support from teachers and educators than their European-American counterparts receive (Bass & Coleman, 1997). In addition, cultures vary in their views of counseling and self-disclosure, with some cultural values that discourage sharing personal difficulty outside of the family (Sue & Sue, 2002; Yeh & Hunter, 2004). As a result, students will be at different levels of exploring ethnic identity for diverse reasons (Holcomb-McCoy, 2005; Phinney, 1992). Thoughtful and culturally sensitive counseling and outreach with students is imperative.

The Case of Marta

To illuminate the process of supporting ethnic identity development in school counseling, this chapter reviews a case example of recently immigrated Marta, a 17-year-old junior-high-school student born in Peru who approached school counselors for support. Marta had moved to the United States to live with her aunt and uncle after the sudden death of her parents in Peru for political dissent. While taking multiple honors courses and working 18 hours per week at a restaurant, Marta was caring for younger cousins to alleviate family burden. Initially, Marta identified having had difficulty making friends in her new school. Though she had excellent English skills, she struggled to balance school, work, and family life with her desire to succeed. At a first meeting, it became clear Marta was having difficulty creating a new identity based on her emergence in the United States absent the support of her parents. She had conflicted feelings about returning to Peru and about what she perceived as abandoning her native country. Responding in culturally appropriate ways that honored the complexity and profundity of her experience was critical.

Individual and Group Counseling

Several authors provide practical strategies for assisting youth with developing positive identities, a process that begins with a self-assessment of the counselor's cultural group membership, values, and multicultural competence, which lies at the core of building good rapport with students (Sue & Sue, 2002). Active exploration of biases and assessment of abilities and limitations provide positive role modeling for students developing their ethnic identity (Fusick & Bordeau, 2004). "If educators understand how ethnic identity affects their interactions and behaviors with students, they will be more equipped to change negative, ineffective relationships (with students and parents) into more positive, supportive relationships" (Holcomb-McCoy, 2005, p. 126). In building a relationship with Marta, it was important that the counselor ask herself "What values do I hold that I might expect Marta to also hold or that I might impose on her?" and "How does my role as a White woman privileged by skin color, education, and U.S.-born status affect our interactions?" It was important that the counselor directly address these cultural differences, including acknowledgment and discussion of her inability to provide service in Marta's native language. English proficiency, as well as both how it influences working with the student in counseling and how it impacts interpersonal relationships and classroom experiences, should be considered. Conversations exploring transference related to therapist–student ethnic match or peer–student interethnic issues help students understand how ethnic identity emerges in interpersonal relationships (Zayas, 2001). Though counselor–student ethnic match is helpful for many students (Bass & Coleman, 1997), it is ultimately having achieved ethnic identity exploration that is most beneficial.

As all counselors are aware, relationship building, caring, and fairness are critical components of successful counseling relationships (Sue & Sue, 2002). Mistrust or skepticism from either the counselor or client meaningfully interferes with the process of identity exploration (Fusick & Bordeau, 2004). Providing open-ended and nonjudgmental questions is critical. It may be particularly important for counselors to have high expectations of all students (Fusick & Bordeau). This serves to counteract stereotypes of ability based on ethnic group membership and provides a platform of belief that all youth have the potential for achievement in areas that are important to them (Thernstrom & Thernstrom, 2003).

In both individual and group settings, students benefit from discussing issues about race and ethnicity (Benedetto & Olisky, 2001). Students should be assured that discussing ethnic and multiethnic identities is a positive and normal part of development. Counselors are encouraged to directly engage in discussions of values, communication, and culture with students, proactively rather than reactively (Caldwell, Oldfield, & Beech, chapter 14, this volume). Through individual and group counseling, counselors invite students to talk with school personnel and fellow students about belief systems in nonjudgmental ways that engender mutual respect for differences (Fusick & Bordeau, 2004; Rayle & Myers, 2004). Specifically, research advocates for helping students place worth in traditional values, as well as in American education, to optimize success (Yang et al., 2003). Counselors might ask, "What values are important to you?" or "If you were describing for someone who you are as a person, what would you say?" Other questions to help youth understand their multiple identities could include "Are there times that you feel pulled between many different ideas of who you are?" or "Some people say they have competing values, like wanting to be their own person and feeling strong commitments to their family. Are

there times you feel unclear about what is most important to you? What is that like for you?" In individual meetings, Marta was invited to describe her life in Peru, how it compared with her life in the United States, and value conflicts that emerged when comparing the two cultures. The counselor refrained from defining Marta by literature on Peruvian culture and from conceptualizing Marta exclusively by South American culture; instead, the counselor gleaned Marta's worldview from questioning her. Though it was tempting to suggest that Marta consider quitting her job or spending less time watching her cousins, it was important the counselor not prioritize or condemn Marta's values, but instead explore how and why those values were lived out in her behaviors, experiences, and choices she made.

Being multiculturally competent includes an awareness of the needs of students from diverse communities, including the needs of multiethnic and immigrant students (Aldarondo, 2001; Yeh, 2003). Counselors do well to consider that youth are struggling with negotiating a large and complex cultural landscape that includes multiple players (teachers, peers, parents and extended family, societal values, and cultural messages). Counselors benefit from making ongoing assessment of the sociological context of the school, including the neighborhood, communities, families, and society to which the students belong (e.g., noting the presence of mentors of color in schools; Thernstrom & Thernstrom, 2003). The development of identity is not a linear or unidirectional process from students to the environment, but instead a bidirectional dynamic between students and the environment. Thus, individuals move in and out of stronger and weaker affiliation with their ethnic identity based upon the cultural context; a holistic perspective of students, including both intrapsychic and interpsychic variables, illuminates the complexity of the student–environment interaction (Yeh, 2004). That includes making assessments of how racial identity is viewed, supported, and cultivated at home and at school (Benedetto & Olisky, 2001). Direct discussions of acculturation experiences and questions about students' new roles can be particularly helpful for immigrating students. Counselors might ask, "How do the people around you think or feel about the culture to which you belong?" or "Are there ever times when you feel as though people around you really support things you value or don't support things you care about?" or "In what settings are you able to feel most comfortable or true to all of the different parts of who you are?" Through counseling, Marta recognized that becoming successful and having the freedom to pursue personal interests were critically important to avenging the cruel death of her parents, although they were not values necessarily shared by those in her school. Marta also explored the importance of giving back to family through childcare to repay the debt she felt toward her aunt and uncle. She was not eager to change her affiliation with either of those value structures, in spite of the dilemmas they presented on occasion.

School counselors help students acquire skills and knowledge to identify, negotiate, and resolve cultural conflicts; to develop as unique individuals; to build coping strategies; and to thrive in spite of external obstacles (Fusick & Bordeau, 2004; Yeh & Hwang, 2000). By encouraging pride in oneself and recognition of individual potential, counselors promote exploration of abilities, interests, strengths, and self-reliance in students (Rayle & Myers, 2004). For example, counselors can directly ask, "What is it important for you to be good at?" or "What is one thing about yourself that you see as an asset and you cherish the most?" or "What is something your family or culture really values about you?" or they can say, "Tell me a few things that you do really well." Reflecting on these questions, students learn skills for integrating disparate parts of their identity to form and reform a sense of themselves and their culture from positive viewpoints (Aldarondo, 2001).

In addition, counselors have an opportunity to help students understand and manage stresses associated with racism, discrimination, and educational barriers and to help students refrain from self-limiting thinking (Fusick & Bordeau, 2004; Thernstrom & Thernstrom, 2003; Zayas, 2001). Because students are not likely to approach counselors with racism or discrimination as a presenting problem, counselors are encouraged to listen for covert material related to ethnic and racial self-definition (Zayas). Students can be invited to reflect directly on how perceptions of race and class help or hinder academic achievement, interpersonal relationships, and academic success (Fusick & Bordeau). Initially, Marta approached the counselor for help building a larger social circle; later, it emerged that she was feeling overwhelmed by keeping up appearances of "doing it all" to counter fear that other students would look down on her. Marta expressed concerns that working to support her extended family and save money for college would interfere with academic achievement, a stressor not shared by many of her middle-class majority peers. While sadness emerged from these realizations, they were instrumental in helping her consider how to respond to these constraints toward building a successful future. While open discussions about culture and values are not simple, when conducted with sensitivity, honesty, and humility, they can be enlightening and inclusive for students who feel marginalized or stereotyped based on ethnic group membership.

Research suggests counselors should consider tailoring programs for bicultural and immigrant youth, who may experience identity differently from monoethnic individuals (LaFromboise et al., 1993; Wardle, 1992; Yeh & Hunter, 2004). Benedetto and Olisky (2001) suggest that work with biracial youth in a school setting should recognize multiple

factors related to biracialism; counselors need to become familiar with myths and stereotypes that perpetuate about biracialism. In addition, Benedetto and Olisky advocate for appreciation of advantages and disadvantages associated with biracial identity status.

Specific techniques such as strengths-based assessments, values-related activities, or exercises that develop a future orientation can be helpful. For example, creating a family genogram helps students explore values held by families, communities, and cultures. Guided imagery exercises helped Marta envision her future. She vividly described two future scenarios, as a fashionably dressed urban working professional, and in a large country home with rooms for extended family and a porch for family meals. Those images reassured Marta of her potential, reminding her that achievement was important to her, and solidified that maintaining family connectedness while excelling at a job was possible. Ultimately, Marta made the decision to shift her restaurant work to a position at a local library where she could study during work time; she also joined a group of students committed to improving conversations of culture at the school. Those shifts in commitments allowed her to remain true to her values while pursuing her social and academic goals.

Developing a multiculturally sensitive program includes acknowledging the dearth of resources available for many students, counseling staff, and schools. Limitations placed on school counseling budgets are real. It is increasingly difficult to engage in programming without sufficient fiscal and human resources. In addition, counselors are frequently called upon to engage in other important activities, such as college preparation or course scheduling. Working in an underserved school may present particular difficulty finding resources and time to discuss identity with individuals and groups. In spite of this, many of the strategies mentioned above involve shifts in attitudes and approaches, rather than costly programs. One of the most powerful interventions can be creating positive environments where ethnic identity is welcomed and celebrated, rather than minimized or disregarded.

Group interventions may be more cost-effective and may be more culturally appropriate for persons of diverse ethnicities (Benedetto & Olisky, 2001; Yeh, 2004). Some authors have found that belonging to specific types of groups, such as peer support groups for Asian immigrant youth, reduces acculturative stress; others have found that belonging to counseling groups allows for open exploration of student feelings of belongingness, affirmation, and commitment as they discuss issues of race and ethnicity (Baca & Koss-Chioino, 1997). Groups can include problem-solving activities and role-playing activities (cf. Holcolmb-McCoy, 2005). In addition, students can be encouraged to work toward changing the environments that are not helping them meet their goals (Cook, Heppner, & O'Brien, 2002). Interventions that highlight positive ethnic orientation and encourage cultural assets, as well as help students cope with cultural conflict, are particularly helpful (Yang et al., 2003). For example the Calm Heart: Ua Siab Tus Yees program promotes healthy cultural identity development and assists students with psychological well-being and school success (Yang et al.). Finding the balance of individual and group interventions for your school and community is an individual process related to resources, community acceptance, and student needs.

Building a Multicultural School Environment

Regardless of the school's ethnic makeup, counselors serve advocacy roles for increasing cultural sensitivity within the larger community (Holcomb-McCoy, 2005; Rayle & Myers, 2004). This includes working with students from the dominant culture—typically, White culture—to engage in self-awareness activities that explore ethnic heritage. Increasing the amounts of cultural references and resources (e.g., books, videos, and posters) available to people in the school, advocating for student uniqueness, and developing opportunities to explore culture are all effective community-building activities (Holcomb-McCoy). In addition, counselors are situated to increase the number of staff training sessions and parent workshops that address culture, as well as to advocate for additional mentors of diverse ethnicities on campus (Thernstrom & Thernstrom, 2003; Wardle, 1992). Both school wide and district wide interventions can increase exposure to race and ethnicity; inviting local leaders from diverse ethnic groups to speak, celebrating diverse holidays, or inviting families to the school for cultural celebrations are all examples of meaningful and cost-effective initiatives (see Benedetto & Olisky, 2001 for a review of multiple initiatives). The bottom line is that counselors must rally all of the resources at their disposal to build developmental guidance programs that are aware of issues of race and ethnicity, that address the importance of diversity, and that encourage respect for diverse cultures in school halls and the larger community.

Summary

The importance of ethnic identity to developmental success of young people highlights the need for counselors to assist all students with developing positive ethnic identity. Because of the dynamic nature of identity, counselors need to visit and revisit these issues with students from all ethnic groups and from the larger community. Experi-

ences of racism or critical events that influence students' feelings about themselves and each other provide unique opportunities for engaging students in this area. The field deserves additional support for ongoing exploration specific to diverse ethnicities and contexts for optimizing learning and development for all students. Proactive school programs improve the cultural context, perpetuate safety, engender respect, and embrace diversity, benefits that are beyond measure.

UNDERSTANDING AND IMPLEMENTING GAY, LESBIAN, BISEXUAL, TRANSGENDER, QUESTIONING AFFIRMATIVE PRACTICES AS SCHOOL COUNSELORS

SHELBY J. SEMINO
Fordham University

Introduction

School counselors have the grave responsibility of creating and maintaining a safe educational community in which diversified groups of children can experience, learn, and develop their social and emotional selves. It is expected that within this academic environment, a culture is created in which our students can reach these developmental milestones without exposure to discrimination or harassment. Unfortunately, for some students, the opportunity to learn in the absence of these harmful conditions fails to present itself, despite the great need. This chapter will focus on the experiences of these students, whose sexual orientation or gender expression is not seen as "the norm," and who are consequently ignored, bullied, or disregarded. Specifically, it is the goal of this chapter to illuminate salient aspects of theory, research, and practice relevant to working with, and promoting acceptance of, sexual minorities within various educational settings.

Before progressing any further, it is important to identify key terms (i.e., sexual orientation, sexual minority, heterosexism, and homophobia) that will be used throughout this chapter. As defined by Sandfort (1997), *sexual orientation* is a multidimensional term that reflects an individual's physical and/or emotional attraction to someone of the same or different gender, one's sexual behavior, and one's identity (i.e., gay, straight, heterosexual, homosexual, bisexual, etc.). For purposes of this chapter, the term *sexual minority* refers to any individual who recognizes within him or sherself an emotional and/or sexual attraction to someone of the same gender (gay, lesbian, bisexual, or questioning [GLBQ]). Additionally, *sexual minority* is inclusive of persons who may be experiencing an incongruity between their external and internal gender identities (transgender [T]). The term *heterosexism* was developed in the early 1990s to encapsulate, at a systemic or institutional level, a constellation of beliefs, statements, and actions that either explicitly or implicitly deny and/or stigmatize any behaviors, feelings, identities, relationships, or communities that are nonheterosexual (Herek, 1990). An example of a heterosexist perspective that often exists in the school environment is the presumption that the parental unit of each of our students consists of a mother and/or a father, without the acknowledgement of a potential same-sex parental unit (i.e., two moms or two dads). Heterosexism is not to be confused with *homophobia*, which is defined as the active fear, ignorance, and hatred toward individuals or communities who identify as having same-sex attractions. A homophobic response to a child with lesbian parents might be, "I cannot believe that Isaac's dikey mothers showed up to the holiday concert. Don't they know that no one should have to be exposed to their queer ways?"

As school counselors who are charged with such great responsibility, we are seen as the "point person" for many members of the academic community. We not only serve the children and adolescents who make up the student body, but we also serve as consultants and educators to the administrative staff, the faculty, and the parents of each child seeking our guidance. Given the nature of this responsibility and the many varied individuals with whom we come into contact, we are expected to be competent enough to assess the needs of the community we

serve. This means, that we are first obligated to identify, and subsequently understand, the factors most relevant in the lives of our GLBTQ students and their families. Once these two fundamental tasks are underway, we can begin to implement effective practices that are inclusive, thoughtful, and respectful. And although it is unrealistic for one to be omniscient of the unique needs of this population, it should be expected that all of us remain open to, and curious about, learning as much as we can.

Forming a Sexual Orientation Identity

To best serve this population of interest, it is of primary import that one is aware of the unique individual developmental tasks and family experiences of members of the GLBTQ community. Fisher and Akman (2002), Reynolds and Hanjorgiris (2000), and McCarn and Fassinger (1996) provided comprehensive reviews of the most widely cited and informed sexual identity development models from the past 25 years (e.g., Cass, 1979, 1984; Chapman & Brannock, 1987; Coleman, 1982; Minton & McDonald, 1984; Sophie, 1986; Troiden, 1989). Citing the major limitations of these former models as being unidirectional with a straightforward trajectory, McCarn and Fassinger developed a more fluid and flexible identity development model that is also inclusive of racial/ethnic minorities (Reynolds & Hanjorgiris). While the McCarn and Fassinger initially proposed their model for understanding the course of sexual identity development for nonheterosexual females, they later extrapolated the model for the use with gay men, and it has received good initial empirical validation (Mohr & Fassinger, 2000). McCarn and Fassinger's model stresses the importance of understanding the bidirectional movement that can occur as one begins negotiating the complex process of coming out and forming one's sexual orientation identity. Diamond (2006) supported the notion that individuals may cycle back through the identity development process as they continue to grow psychologically, emotionally, and sexually and begin to encounter different experiences across changing environments. Counselors working with individuals across different age groups must be particularly sensitive to this suggestion and proceed cautiously with their assumptions regarding normative and pathological development.

As evidence of the previously mentioned point, the McCarn and Fassinger (1996) model comprises two parallel contextual planes (*Individual Sexual Identity* and *Group Membership Identity*) and four developmental phases which include (a) awareness, (b) exploration, (c) deepening/commitment, and (d) internalization/synthesis. The authors wanted to develop a model that addressed the different experiences that can occur within these two contextual planes (*Individual* vs. *Group*). For example, a woman may be successful in traversing the internal processes involved in integrating lesbian feelings and desires, but because of oppressive environmental conditions, she may not be able to fully integrate a lesbian group membership identity (McCarn & Fassinger). An important component of one's ability to move through these phases, at two different levels, is the individual's attitudes. Thus, this model incorporated a concept often built into popular ethnic/racial identity models that acknowledge an individual's "attitudes towards self, other lesbians/gays, and non-gays" (McCarn & Fassinger, p. 522).

Movement through the four phases, on the two parallel planes can be considered "reciprocally catalytic but not [necessarily] simultaneous" (McCarn & Fassinger, 1996, p. 521). These phases take into consideration the fluidity and flexibility often required in the ongoing negotiation process of developing self and group identity memberships within two worlds (*Individual* vs. *Group*; McCarn & Fassinger). While McCarn and Fassinger suggested that the more one accepts/integrates ones same-sex attractions and labels ones sexual orientation identity, the less one will experience psychic conflict and distress, Diamond (2006) posited that labeling oneself is not entirely necessary for developing a healthy sense of self.

From a practical perspective, we should be sensitive to the importance and value the student places on constructing a labeled identity for him- or herself. We should not assume that because the student does not label him- or herself gay, lesbian, or bisexual, he or she is living in denial of who he or she is or how he or she feels. Rather, we should accept the student where he or she is developmentally and explore with the student the meaning he or she attributes to his or her same-sex or both-sex attraction. When working with a student who is evidently moving through these developmental phases at both a personal and group level, it is important to maintain a theoretical understanding of the developmental process but not necessarily label these phases for the student. What is important, however, is being able to validate and normalize the student's feelings, which may include confusion, anger, sadness, joy, excitement, and curiosity. It is important that we provide the student with GLB resources that address his or her individual experiences and talk with the student about ways in which he or she can explore GLB support groups or community activities. As school counselors, we want to be able to show these students that positive GLBT role models and community organizations do exist and are available for them to access, whenever they feel ready to do so.

Talking with students about concerns pertaining to their sexual identity development can be very challenging for counselors and educators who have very little experience working with GLBTQ issues. As with any other form of counseling, it is important to meet the student where he

or she is and not to pressure him or her to discuss anything he or she may not feel comfortable discussing. It is important, however, not to confuse your discomfort with what the student is feeling. The following brief excerpt is from a session between a school counselor and a 9th grade male student who sought guidance because he was being teased by students for acting "too girly."

School Counselor: Hey John, thanks for coming to visit me today. What's up? What's been going on?

John: Nothin. It's just that school is so crappy right now.

SC: Oh yeah? What is making school feel so crappy right now?

John: I dunno. It's . . . the kids. They're always runnin' their mouths, saying stuff to me behind my back, and saying that I'm a fag.

SC: Wow, that must not feel good, knowing that there are kids saying stuff about you.

John: I know. It isn't a good thing. And I don't even know what to say back to them. I mean, I don't know why I act the way I do, it just happens. I know I like more girly things but it still doesn't give them the right to say stuff. And my teacher totally lets it go on.

SC: Huh. . . . So it sounds like there are a couple of upsetting things happening right now. First, the other kids are saying stuff to you that you don't like. And, second, the teacher hears what is going on, and he's not stopping it. That doesn't really sound like it is too comfortable to be in class. It must be hard to listen and pay attention to the lecture.

John: Totally. I mean, am I wrong for how I am acting? I just was never into like football and being rude to the other girls in the class, saying nasty things to them, like the other boys do.

SC: Listen John, the first thing I want you to know is that there isn't anything wrong with the way you act. You are you, in whatever way, shape, or form that may appear. I am glad that you treat your peers with respect, and am disappointed that the other kids don't seem to be doing the same.

John: It's like, even if I were gay, I would so not tell anyone here at this school. People can be so close-minded.

SC: That's true John, there are a lot of close-minded people in this world, which is a really unfortunate thing. But coming to terms with your sexuality can be really confusing, and you may need to talk to someone eventually about that kind of stuff, ya know? So, do you feel like, if sexuality was something you felt confused about, or needed to talk with someone about, you had at least one person to do that with?

John: Um . . . no, not really. I mean I have friends from summer camp I could talk about it with, and I have a little bit, but no, no one here at school.

SC: Ok. Well, I want to let you know that you can come here and talk with me about this stuff whenever you want. OK? Although you may feel nervous or scared to come here and chat about it, this office is a totally safe space and we can talk about whatever and no other student or teacher needs to know. Alright? I know it must have taken a lot of guts to come visit me today and let me know what's going on, so I appreciate that a lot.

John: Thanks.

SC: And because it is a really important issue, I wanted to know if I had your permission to speak with the faculty about their responsibility to clamp down on all the name-calling stuff that seems to be happening in the classrooms. You should know that you are not the first student to bring it to my attention, and I really want to make sure that the staff knows, this kind of language is so not okay here at school.

John: Well, as long as you don't say my name, I'm cool with it. And I'm really not the only kid who has said this to you?

SC: Nope. John, you aren't alone here. My door is always open to you. Okay?

John: Kay. Thanks. Can you write me a pass so I don't get detention?

SC: No problem.

Researching the Educational Environment

Having a greater sense of the developmental process that many GLBTQ individuals endure while forming their sexual identities, one is able to begin to think about the potential factors that could either thwart this developmental course or contribute to the construction of a healthy identity. In recent years, research has focused primarily on the sexual identity developmental tasks faced by those in their middle to late adolescent years, as well as adults. Very little, if any, has focused on early childhood development as it relates to sexual orientation issues. The research, which has not focused on clarifying the developmental tasks and processes of sexual minority youth, has given more attention to examining the environments in which these students learn and the effects of these educational climates on variables such as self-esteem, mental health, and substance use.

As one might imagine, limited empirical data and literature are available, despite the great need for this knowledge. One of the greatest barriers to obtaining data specific to this population in the educational context is the individual's fear of being "found out," as many GLBTQ students feel the need to hide their orientations and fit in with the general population so they do not become victims of harassment (Hunter & Mallon, 2000). Another

limitation of doing research with this population is the researcher's struggle to obtain a diverse sample of research participants (Croom, 2000). Because GLBTQ persons are not easily identifiable physically, researchers must rely on individuals who are willing to identify themselves as GLBTQ persons. This results in a skewed representation of GLBTQ persons comfortable with having and expressing their sexual minority statuses. Naturally, it behooves the field to develop more secure and confidential means of obtaining such sensitive information, so that the field can continue to make progress in understanding, more deeply, the needs of different GLBTQ persons.

One avenue of research that has presented itself over the past several years, and one which can continue to grow and proliferate worthwhile information, is the examination of the attitudes that school counselors, administrators, faculty, and general student bodies possess with respect to GLBTQ persons. Because students spend much of their days in the presence of other students and in the care of school professionals, school counselors must begin to take inventory of how their academic communities fare with respect to homophobia, heterosexism, and gender-phobia. Institutionalized homophobia is a very real concern in many school systems, but can often be overlooked, and consequently perpetuate the message that it is okay to ignore GLBTQ issues (Fontaine, 1998). The following is a summary of a national research effort spearheaded by the Gay, Lesbian and Straight Education Network (GLSEN) that examined current school cultures across the United States.

GLSEN is one of the most comprehensive resources that all school counselors across the United States should consult. This organization provides invaluable information to administrators, educators, counselors, students, and the public about current and historical research and action-oriented efforts that have helped create safe educational environments for sexual minorities. In 2006, GLSEN reported findings from their 2005 National School Climate Survey, which assessed the experiences of over 1,700 gay, lesbian, bisexual, and transgender youth between the ages of 13 and 20 years old. This seminal study sheds light on some of the hostile and unwelcoming environments in which many of our children obtain their education and develop their self-esteem and identities. Results from this national survey found that over 75% of students had heard homophobic or antigender expression language spoken during the school day (GLSEN). Of these students, it was reported that 89.2% of them heard such comments on an often/frequent basis (GLSEN). Even more disturbing, however, is the percentage of students (18.6%) who reported hearing homophobic remarks and comments being made by teachers or other school staff (GLSEN, 2006). Some homophobic or transphobic comments often heard in the hallways and classrooms of schools are the following: "fag," "no homo," "dyke," "lezzie," "queer," "that's so gay," "homo," "fairy," "butch," and so forth.

Apart from the experience of hearing homophobic or antigender expression language, 64.3% of students reported feeling unsafe in their schools because of their sexual orientation, while 40.7% reported feeling unsafe due to the expression of their gender (GLSEN). Furthermore, 37.8% of students had faced physical harassment due to their sexual orientation, while 26.1% of students endured the same harassment due to the way in which they expressed their gender identity (GLSEN). These findings suggest that the school environment, while intended to be a place for learning, discovery, and achievement can, in reality, be a place of torment for this population. This is of even more concern given that many students already face rejection from their families and are highly vulnerable to low self-esteem and negative mental health symptoms (D'Augelli, 2006).

Another important area of research that must continue to grow is the exploration of the relationship between students' exposure to harassment and the impact it has on their well-beings and developing senses of self, identity, and connection within the community. The effects of experiencing harassment at school are just as worrisome as the actual occurrence of it. Fisher and Akman (2002) asserted that sexual minority youth who are harassed due to their assumed sexual orientation are at greater risk for being threatened and/or assaulted, are more likely to fear for their own safety, may avoid school altogether, and may be at greater risk for engaging in self-harming behaviors such as abusing substances and contemplating suicide. It is obvious that these negative consequences of pervasive school ignorance and incidents of harassment do not contribute to feelings of support and emotional containment. And although incidents of harassment or anti-GLBTQ assaults may not be as prominent in your academic community, it is important to consider what, if any, subtle messages of homophobia, heterosexism, or gender-phobia are being generated by administrative staff and faculty.

An example of heterosexist language that is often observed in early education classes is the persistent assertion of a mother and father dyad in a child's family. Also, many of the early stories we read or tell to our younger students are about families with a mother and a father as the parents. Further along in the educational system, teachers and counselors begin to speak with students about marriage, having children, and so forth, processes that for most GLBTQ persons are either illegal or very difficult to navigate due to systemic and institutional biases and prejudices. As educators, we must continue to be mindful of the language we choose to use in addressing our students (i.e., instead of saying, "when you get married," consider saying,

"when you find a partner with whom you want to settle down"). Small modifications to the statements we make today can leave an indelible mark on our students of the future.

Putting Awareness and Knowledge Into Action

Thus far, this chapter has identified the processes by which individuals begin to identify and form their sexual orientation identities, it has acknowledged the reality of how hostile and unwelcoming academic environments can be, and it has provided insight into the negative impact that such toxicity can have on students' emerging self-esteem and mental health. Hence, there should be no question as to why school counselors must bear the responsibility of guiding and directing administrative staff, faculty, students, and their families. School counselors are expected to consult with these parties to help them create educational communities that accept all students, regardless of sexual orientation or gender expression and to sustain climates that do not tolerate hate, hostility, or ignorance. However, although the reasons may be clear as to why we must take on this responsibility, we may not know how to put our knowledge into action. This section will provide insight into affirmative practices that can help guide our efforts.

As cited in the *American School Counselor Association Ethical Standards for School Counselors* (American School Counselor Association [ASCA], 2004), section "E.2. Diversity," a professional school counselor is not only expected to affirm diversity in the school community, but he or she is also expected to increase awareness of one's own cultural attitudes and biases toward culturally different individuals and to obtain training and greater knowledge in areas that are deficient with respect to multicultural competence. This indicates that if an individual has very little understanding, awareness, or experience in working with GLBTQ students and families, he or she is expected to obtain adequate knowledge and insight through supervision, consultation, and various training opportunities. We must be able to assess our biases, judgments, strengths, and limitations of competence when it comes to working with this particular population and be willing to challenge others and ourselves so that we may continue to move forward in our efforts.

As evidenced in one school's report about promotion of an affirmative GLBTQ school environment, commitment level is one of the most important and primary factors to be assessed (Bauman & Sachs-Kapp, 1998). Beyond the commitment needed from the administration and the staff, Bauman and Sachs-Kapp acknowledged the importance of enlisting student leaders to help generate greater commitment among the student body. The goal here is to help create a network of peer support and peer-influenced affirmation of the GLBTQ population. Once a greater commitment level is experienced at administrative, staff, and student levels, school counselors can begin to have more in-depth dialogues with each level and determine what efforts are needed to promote greater acceptance. An exemplary model of a high school demonstrating a strong commitment level may include the following in their academic communities: (a) a GLBTQ and Straight Alliance Group, (b) awareness and promotion of National Coming Out Day, (c) implementation of a Zero Tolerance Week against homophobia and heterosexism, and (d) GLBTQ History Month (showcasing the contributions of major political figures of this community).

McFarland and Dupois (2001) provided a comprehensive overview of the strategies used in various school systems across the United States to create a safe school environment for their GLBTQ students. McFarland and Dupois specifically highlighted the work of the Massachusetts Governor's Commission on Gay and Lesbian Youth (1993) that has been successful in providing and implementing a useful framework for educators to follow. The Governor's Commission report, as cited by McFarland and Dupois, suggested implementing change in the following five areas: (a) establishing clear school policies regarding harassment, (b) training all school staff and administration about appropriate ways to prevent and intervene in harassment and violence against GLBTQ students, (c) developing active school-based GLBTQ–Straight Support Groups and Alliances, (d) providing relevant and useful resources about the GLBTQ community in visible areas and in libraries, and (e) infusing GLBTQ-related information and subject materials into schools' curricula. Serving as a consultant to educators and administrators across different academic levels, we can help schools implement these suggestions in earnest and applicable ways. With attention given to the developmental and educational abilities of varying grade levels, support from the administration, and creativity, these strategies can prove to be incredibly useful.

An intervention suggested by Nichols (1999) is the creation of a Diversity Room located in a very visible and easily accessible space in any school (elementary, middle, or high school). Depending on the grade level, the content shared will need to be modified, but the mission of the Diversity Room should be consistent and universal—providing a safe space for all students with zero tolerance for violence and harassment. Nichols further suggested that each Diversity Room be run by a Diversity Room Specialist (DRS), a professional who is multiculturally competent, who consults with the school counselor, and whose primary responsibility is to appropriately work with students and educate staff about diversity issues related to the GLBTQ community. To assist in such an effort, Kimmel (2000)

provided a very clear outline of important topics specific to the developmental years of infancy, early childhood, middle childhood, early adolescence, and adulthood.

An example of how to work with students at the middle or high school level could be that the DRS serves as a consultant to the school's Social Studies/History Department and suggests the exploration of significant moments in the history of the GLBTQ community (e.g., Stonewall; AIDS epidemic; Marriage Equality Rights, etc.). Another example could be that DRS works with the English/Language Arts Department and helps teachers incorporate writings from several prominent GLBTQ authors into the curriculum. At the elementary school level, the DRS could organize a unit on teaching tolerance about diverse family systems, which includes children of same-sex parents, or a unit on accepting gender nonconforming play and dress.

Along the same lines, the school counselor could develop a monthly program, in cooperation with the Health Education Department (at both middle and high school levels), that helps to educate parents and students, individually and collectively, about important mental health concerns, safer sex practices, dangers of drug and alcohol use, and so forth. These monthly meetings could also be used as a forum in which GLBTQ alumni return to their schools and serve as positive role models. Alumni could meet with students, parents, teachers, and administrators to discuss their experiences in middle and high school and to inform them of the ways in which they have successfully navigated their college and professional careers.

Once these systemic interventions are implemented and are proving to be effective at the institutional level, school counselors must continue to think about how best to meet the individual student and his or her needs. Aside from the need to receive weekly individual supportive counseling, many GLBTQ students report feeling alone and isolated, wanting to develop a network of peers who are negotiating similar struggles (Savin-Williams, 1994). To reduce this sense of loneliness, it has been suggested that group counseling be implemented and effectively carried out (Muller & Hartman, 1998). Muller and Hartman provided several relevant topics that could be useful to process at the group level, which include homophobia in the school, feelings of loneliness and isolation, identity issues, alienation from family, suicidal ideation, drug and alcohol use, and perceptions of self and others' perceptions of self. Specifically, in a group session that is focusing on homophobia in the school, students can be encouraged not only to process their feelings related to this abuse, but also to use the support of each other to strategize ways in which they can effectively handle such situations so that they can protect themselves and not compromise their self-esteem and dignity. Furthermore, counselors can help students develop effective ways to inform teachers, staff, and administration when these incidents are occurring. Another specific example of how counselors can utilize group counseling is helping students focus on exploring and coping with feelings of loneliness and isolation because of their minority statuses. Trusted counselors can encourage students to not only to process their emotional experiences, but also to develop strategies that can help reduce the students' urge to self-medicate through the use of alcohol, drugs, overeating, or other self-harming behaviors. Such discussions, which occur in a safe and trusting space, can help serve as a buffer against negative emotional and psychological outcomes. Due to the often intense nature of this kind of support/process group, it will be of vital importance that the professionals coleading the group obtain excellent supervision.

An additional component to providing direct counseling services to our GLBTQ students is carving out a safe space in which collateral or family work can be conducted. While not all GLBTQ students may be out to their parents or families, some definitely are. As the literature indicates, parents often have difficulty in accepting their children's identifications as GLBTQ persons and may react negatively to this news (Fisher & Akman, 2002). What is hopeful, however, is the notion that parental support, when it is bestowed upon children, can have very positive effects on children's mental health (Hershberger & D'Augelli, 1995). Thus, the goal in working with families is to help parents explore their concerns, fears, and other negative feelings, while working toward a level of acceptance and support that is beneficial to children.

A key component to conducting successful family counseling is developing a working alliance with parents. Despite one's personal feelings toward a parent who is unsupportive of his or her GLBTQ child, it is important to find the strengths that the parent endorses and to capitalize on these positive attributes. Without the commitment on the part of the parents, family work cannot successfully meet the necessary goals, and you put the children at greater risk. Once you are able to get the parent "hooked in," you can begin to work on providing important psycho-education about the coming-out process, the GLBTQ community, related mental health issues, and so forth. It will be important to dispel myths that parents may believe and to answer any questions (no matter how ignorant) they may have. Oftentimes, parents wonder "where they went wrong" in their parenting, or they want to place blame on early childhood experiences that students may have endured. It is critical that you normalize their children's identities so that parents do not pathologize their parenting skills or their children's behaviors and feelings. Parents may express feelings of anger, sadness, confusion, disappointment, and fear regarding their children's identities. Just as with any other controversial topic, it is necessary that you appropriately draw boundaries and set limits with

respect to the language that can be used in a child's presence. Providing parents with helpful resources and outlets to explore and discuss their feelings about their children's sexual orientation or gender identities is of absolute importance. One very comprehensive source of support for helping parents navigate this difficult process is PFLAG (Parents, Families and Friends of Lesbians and Gays), an organization whose presence is well represented and accessible across the United States.

The practical suggestions just discussed are to be seen as helpful resources that we can begin to implement as we focus on creating an affirmative GLBTQ environment. These suggestions are by no means exhaustive, but they do provide a sampling of ways in which we can be effective in our roles as schools' point persons for handling the diverse needs and crises of our students and their families. The following case study can be used to generate a discussion about case conceptualization and practice–planning strategies. With the theory, research, and practical applications just discussed, you are encouraged to challenge yourself in anticipation of working with a student such as Mariana.

The Case of Mariana

Mariana is a 17-year-old, Mexican-American female who is currently enrolled in 11th grade at a public high school in New York City. She is a particularly bright young woman who has historically excelled academically and who is well liked by her peers. Mariana immigrated to this country with her mother, father, and two younger brothers 7 years ago. Mariana's family has struggled financially throughout the years, especially during their immigration to this country. Because of these struggles, Mariana has developed a close relationship with both of her parents. Her father, who adores "Marianita" is a contractor and carpenter and has been able to successfully build a small business that he hopes to leave to his son when he retires. Mariana's mother, a religious woman, attended university in Mexico and was a practicing schoolteacher until she gave birth to Mariana 17 years ago. Since then, she has dedicated herself to raising her family and supporting her husband. Both of Mariana's parents are supportive of her desire to attend college, but they also have many expectations about her getting married and having three children, just as they had done. While Mariana is career-focused, she feels a lot of pressure to make her parents proud and fulfill the dreams they have for her. She feels that because they worked so hard to move the family to the United States, she owes this to them. Recently, Mariana's older female cousin and Mariana's mother began planning Rosa's wedding. Since this planning began, Mariana's mother has been pressuring Mariana to spend "some time" with a young male family friend visiting from Mexico. Mariana is aware that her mother wants her to spend time with Julio because she never "hangs out with boys," but Mariana wants to stay focused on her academics. Furthermore, Mariana finds Julio to be "annoying and childish" and finds him not sophisticated enough for her interests. Simultaneously, Mariana has become preoccupied with having an emotional and sexual attraction to one of her closest female friends. Despite this attraction, Mariana has not labeled herself as lesbian or bisexual, and she thinks that this is just a "weird thing" she is going through. She knows that lesbians do exist in the world, but she is unaware of any Chicana in her world liking another Chicana. Therefore, she thinks "that kind of thing" just happens with "White chicks with weird hairdos and piercings."

Recently, Mariana was referred to you for counseling because of a sudden drop in her grades and teachers' observations of increased sleepiness in class and a withdrawn attitude. Teachers report that this change in behavior was quite noticeable because of Mariana's past academic involvement and leadership in the classroom. Mariana has informed teachers that she is "fine, just tired, and stressed," but she has not been able to expound upon this with any of her teachers.

Points/Questions to Consider in the Case of Mariana

1. As her school counselor it will be important for you to align yourself with Mariana in a nonthreatening, nonjudgmental manner.
2. It is important to assess your assumptions about Mariana being a Mexican-American female who has a history of attraction to a close female friend.
3. Assess your own level of comfort being a male or female, heterosexual or nonheterosexual, or ethnically similar or different counselor working with a Hispanic female who is struggling with her sexual orientation.
4. Are there questions you have that you need clarification on from your supervisor? Do you feel like you have the appropriate resources to consult in order to best work with this student?
5. Once a rapport is established, it will be important to explore how Mariana understands the changes in her grade point average, class participation, and sleep patterns.
6. If Mariana discloses to you her same-sex attraction and her confusion regarding this attraction and her Hispanic identity, are you prepared to direct her to resources that embrace both a Hispanic and a GLBTQ identity?

7. Are you aware of any support groups in the school setting that you could involve Mariana in so that she may begin to meet peers who are negotiating a similar identity process?
8. Explore with Mariana any potential conflicts she may be experiencing related to her need to satisfy her parents' dreams for her and her own desires for her future.
9. How might you be able to work with the family if Mariana does end up identifying herself as a member of the GLBTQ community?
10. How might you be able to work with the family if Mariana accepts her same-sex attraction but does not want to disclose this to her parents?
11. How can you work with Mariana to effectively cope with the underlying anxiety and conflict she is experiencing so that she may continue to excel at school and once again become an active member of her classroom discussions?
12. Are you aware of what it means culturally to be a Hispanic female from a Mexican family with same-sex attractions?
13. If Mariana were to begin to be more open about her sexuality and began to experience forms of harassment or taunting, how might you work with the school system to intervene effectively? How might you work with the school system to prevent the development of a culture in which harassment is acceptable?

It is important to begin to consider these previously mentioned questions and to think in a multidimensional manner about how to best address the complicated and competing factors Mariana is facing. As school counselors, our abilities to work creatively, comprehensively, and thoughtfully will be challenged each day, and it is important that we be as prepared as we can be. Exercises such as this can help us do just that.

Recommendations for Future Research

As issues pertaining to sexual orientation and the GLBTQ community become increasingly prominent in entertainment, media, and public/political debates, it is important that we, as members of the field of psychology, provide accurate and useful information that can help create a general atmosphere of acceptance and understanding. As school counselors, we have an obligation to all of our students to become more actively involved in the research that is currently under way. While we continue to explore the developmental processes of GLBTQ youth and the effects of harassment on students' mental health and self-esteem, we must extend this research to be more inclusive of racial and ethnic minorities. These groups are often underrepresented in the literature regarding GLBTQ youth, but their experiences are just as critical to understand. We need to extend research to include younger developmental age groups so that we may fully understand when and how the process of sexual orientation/gender identity formation begins. As we implement practical strategies to help guide others, we must assess the efficacy of our efforts. It will be important to keep an open dialogue about what attempts appear to be facilitating optimal development, and what seems to be failing. Additionally, we need to develop more creative ways of reaching out to and assessing youth who may be apprehensive about sharing their experiences and otherwise remain outside of our purview.

Recommendations for Practice

As school counselors move forward in their work toward developing, maintaining, and sustaining GLBTQ affirmative practices in the school environment, it is essential that we convey the importance of these efforts to our school administrators, faculty, students, and their families. We can lead this effort by setting expectations of ourselves that require us to continuously look inward, assess our own biases and prejudices, and address our limitations head-on. We must enlist the help of our colleagues and our counselors-in-training to set a standard of practice that not just tolerates, but accepts and affirms our GLBTQ clients. As school counselors, we must actively consume the literature that continues to emerge and effectively transform what we read into practice. These efforts are not just limited to our counseling practices, but are far-reaching and include program development, advocacy, and community service. We must take the information disseminated from organizations such as GLSEN, PFLAG, the Human Rights Campaign, and the Safe Schools Coalition and clearly present it to those we serve and those with whom we work. It is no longer acceptable to simply react to the harassment and assaults that our students face on a daily basis. It is time now to advocate for these students' rights, to affirm their existence, and to inform even the most ignorant of offenders.

XI
SOCIAL CLASS IN SCHOOL COUNSELING

WILLIAM MING LIU, ALICE FRIDMAN
AND THOMASIN E. TRANEL HALL
University of Iowa

School counselors understand the importance of comprehending and integrating context into their work (e.g., Bronfenbrenner, 1986). School counselors working in various situations from kindergarten to 12th grade understand that social, political, and historical contingencies have leverage in their practice. In this chapter, context refers to social constructions of race, gender, and social class, and the sociopolitical (e.g., the unequal distribution of power), sociohistorical (e.g., biased and inaccurate histories of peoples), and sociostructural (e.g., legal, educational, and economic systems) forces that perpetuate inequality and marginalization (Liu & Ali, 2005). Of all the different contexts, social class is one of the least understood in counseling and psychology. Therefore, the focus of this chapter will be on understanding and integrating social class perspectives into school counseling. Specifically, the chapter will address social class issues related to children and adolescents from low-income, poor, and impoverished environments, as well as those from the middle and upper classes. In the research review, keep in mind that many lower-class K–12 students are typically African American or Latino American; as a result, race and social class are often confounded in the extant research. Although this makes it difficult to tease apart the precise effects of the two variables, this is a bigger problem for research than for practice. Ethnicity and social class are fundamental personal characteristics that necessarily interact in affecting any individual with whom a practitioner works; therefore, it is unnecessary, and possibly even harmful, for practitioners to treat ethnicity and social class as separate entities. Because this chapter is concerned mainly with the role of social class in the practice of school counseling rather than in research, it will not attempt to untangle the effects of race and social class, but instead will examine their interaction in affecting the children with whom school counselors work.

Much has been written about social class, children, and schools. This chapter synthesizes some of the literature and provides a subjective approach to integrating social class into school counseling. The authors use the term *social class* rather than *socioeconomic status* (SES) for two reasons. First, the terms *social class* and *SES* have no real theoretical difference (Liberatos, Link, & Kelsey, 1988; Oakes & Rossi, 2003), and therefore, one term does not convey any more significance than the other does. We select the term *social class* because of the connotation that people operate from a worldview that tends to distinguish different groups (i.e., social classes such as middle class and lower class). Second, social class is more easily tied to classism if one believes that people operate from different social class groupings (Liu, 2001; Liu, Ali, Soleck, Hopps, Dunston, & Prickett, 2004; Liu, Soleck, Hopps, Dunston, & Pickett, 2004). Finally, the term *social class* is more compatible with a subjective/phenomenological approach to social class issues. This approach argues that individuals' subjective perceptions of their social standing are more important than objective indices of social class, such as income and education, in determining people's experiences of social class and the resulting psychological outcomes.

In this chapter, the authors will first discuss why social class should be used to inform school counseling practice. Specifically, the authors will discuss how social class has been used in the counseling research and practice literature. Second, the authors will address the current limitations to understanding social class in school counseling. Third, the authors will focus on two aspects of school counseling practice: developmental guidance and vocational guidance. The authors will critique the current theory and practice and provide examples of informing both aspects of school counseling through social class. Finally, the authors will

present some practice implications and advocate the use of a subjective/phenomenological approach to social class.

Social Class and Counseling

Social class is difficult not only to operationalize, but also to integrate into clinical practice (Frable, 1997; Liu, Ali, et al., 2004; Liu, Soleck, et al., 2004). What do counselors imply when they describe a parent or student coming from a "working-class" or a "middle-class" background? Although we intuitively believe that people have a common agreed understanding of "working class" or "middle class," the research does not support this conclusion (M. T. Brown, Fukunaga, Umemoto, & Wicker, 1996). Certain characteristics do exist that people often use to make informal distinctions among different social classes. The most basic include amount of income, type of occupation, level of education, and location of residence; other, less concrete characteristics include manners of speech and dress, leisure activities, spending behavior, cars, jewelry, and other visible possessions. Although it is important for school counselors and researchers to be aware of these informal indicators of social class, we caution against relying on this information to make inferences about students' social class standings. Such an approach could lead to making incorrect assumptions that could anger or alienate the students with whom counselors work. Instead, school counselors should focus on students' subjective views and experiences in assessing the impact of social class in their lives, as suggested in the subjective/phenomenological approach.

Although social class is important, school counseling literature has not addressed it. For example, Holcomb-McCoy (2004) addressed the growing need for multiculturally competent school counselors and has suggested nine overarching areas under which a checklist of 51 competencies fall: the areas comprise (a) multicultural counseling, (b) multicultural consultation, (c) understanding racism and student resistance, (d) multicultural assessment, (e) understanding racial identity development, (f) multicultural family counseling, (g) social advocacy, (h) development of school–family–community partnerships, and (i) understanding cross-cultural interpersonal interactions. The author fails to include social class as a multicultural variable, however, and thus neglects one extremely pertinent form of competence for the multiculturally competent school counselor and ignores the potential impact of the intersection of race, gender, and ethnicity on children's social, emotional, and academic adjustment during their elementary school years.

The research on social class, children, adolescents, and schools suggests that school counselors must understand social class in order to develop appropriate interventions, prevention programs, and sensitive consultation practices. The extant empirical research reveals a number of ways in which social class is linked to developmental outcomes. For instance, the research shows that child and adolescent development is negatively affected by socioeconomic disadvantage (Evans, 2004; McLoyd, 1998), that parenting practices vary by social class (Hoffman, 2003; Lareau, 2003), and that poverty is related to child conduct problems (Dodge, Pettit, & Bates, 1994.) Mothers' low educational level and teenage pregnancy are related to physical aggression among boys (Nagin & Tremblay, 2001). Poverty and low income lead to poor physical health in infants, which is associated with cognitive deficiencies, poor socioemotional adjustment, psychophysiological stress, and developmental delays (Duncan, Brooks-Gunn, & Klebanov, 1994; Evans & English, 2002; Pollitt, 1994). Poverty also negatively impacts the quality of the home environment (Garrett, Ng'andu, & Ferron, 1994) and increases children's exposure to community violence (Ackerman, Brown, & Izard, 2004; Rasmussen, Aber, & Bhana, 2004). Unemployment and work interruptions are related to maternal stress and depression, and consequently, cognitive distress, low self-esteem, and developmental problems among some adolescents (Conger, Ge, Elder, Lorenz, & Simons, 1994; McLoyd, Jayaratne, Ceballo, & Borquez, 1994). Finally, poverty is associated with poor social competence (Garner, Jones, & Miner, 1994) and, along with maternal depression, jeopardizes early child development (Petterson & Albers, 2001).

Social class also has some specific implications for schools and school counselors. For instance, poverty is related to restricted access to resources and poor teacher quality (Lee, 1999). White students are more likely to be of higher social class and apply to college at higher rates than African American or Latino students (Valadez, 1998), and students who are poor are treated unfairly in comparison are middle- and upper-class White children (Bemak, 2005). All these effects of social class, both at school and in the home, demonstrate the importance of social class to children's lives and the necessity of considering this variable in the practice of school counseling.

Day-Vines, Patton, and Baytops (2003) also explored the complex interactions among race, culture, and social class, and the impact of such interactions on African American adolescents. Using a case study of "Tiffany," an upper-middle-class, 10th-grade African American, the authors illustrate the ways in which culturally responsive counseling practices challenge traditional stereotypes and the tendency for counselors and educators to view social class and race as mutually exclusive elements of one's identity. Such a model encourages counselors to investigate the relative contributions of race, class, gender, religion, sexual orientation, and geography to marginalized children's identities and experience of the world. The case example

demonstrates one possible interaction between race and class, wherein class serves as a buffer from certain risk factors (e.g., malnutrition, inferior education), but does not lessen the experience of racism and discrimination for the individual. In addition, the example illustrates specific ways in which school counselors can encourage students and families to utilize community resources to promote academic achievement. Day-Vines et al. (2003) caution against making inaccurate generalizations about race and social class that could lead to further misunderstanding and miscommunication among counselors, educators, and students. They also offer important insight into the potential risks of considering only the upper and lower ends of the social class spectrum, and they highlight concrete methods by which class can enter into multicultural dialogues.

The association between social class and physical, emotional, and mental health has become the focus of research attention among middle- and upper-class individuals, who, until only recently, were considered relatively impervious to the risks experienced by their lower class counterparts (Luthar & Latendresse, 2005a, 2005b). Luthar and Latendresse addressed the importance of considering the entire continuum of social class in both counseling and research, and they described the problems associated with affluence. Adjustment difficulties, for example, are seen among suburban youth who face unique barriers to well-being, such as isolation from adults and increased pressure to achieve. Children of affluent parents often experience anxiety and depression as a result of failing to meet parental expectations, and they report distress associated with parent–child interactions. In addition, elevated rates of substance abuse are also seen among children and adolescents of popular standing among their peers (Luthar & Latendresse, 2005a, 2005b). Researchers have also shown that upper-class adolescents report feeling greater discrepancies between their bodies and the norm, which is, in turn, related to increased symptoms of eating disorders (Sanderson, Darley, & Messinger, 2002). These findings highlight the importance of considering the effects of social class across all individuals.

Limitations to Our Understanding of Social Class

How can we know so little about social class if there is so much research on social class, children, adolescents, and schools? A brief review of the literature suggests that the difficulty lies in the ways in which social class is used in research. Although the literature critiquing current conceptualizations of social class in counseling is far too extensive for this chapter, some highlights will be presented to help orient the reader.

Generally, much of psychology uses a social class conceptualization based in sociology (Liu, Ali, et al., 2004). While sociology is interested in group-level characteristics and phenomena, psychologists and counselors are interested in the ways an individual thinks, behaves, and conceptualizes the world. Sociologists tend to used income, education, and occupation to classify individuals into various social class groups (e.g., middle-class; e.g., Entwisle & Astone, 1994; Hauser, 1994), and thereby assume that everyone within those specific groupings thinks and behaves similarly. Consequently, within-group variation is not explored fully. In contrast, Liu, Ali, et al. suggested that counselors consider using social class as a descriptor for a psychological framework. For instance, Liu (2001) used social class to describe a particular type of worldview for his Social Class Worldview Model (SCWM). This suggestion would be consonant with the subjective/phenomenological approach and with the way that psychologists view other cultural constructs. For example, counselors study racial identity and acculturation instead of race itself, and they examine gender role identity and conflict rather than gender. By doing so, it is possible to address and validate individuals' subjective experience of race, culture, and social class.

There are also other problems with the way social class is used in counseling. Social class can vary from time to time depending on income, occupation, and other family circumstances and, therefore may not always be a static characteristic (Duncan & Magnuson, 2003). Poverty and low social class are often treated similarly (Huston, McLoyd, & Coll, 1994), race and social class are frequently intertwined (Huston et al.), and the effects of transient and persistent poverty need to be teased apart (Huston et al.). There are also gender differences in educational attainment and occupation between men and women (Bornstein, Hahn, Suwalsky, & Haynes, 2003). As previously addressed, our current understanding of social class is limited to the extant research, which has largely ignored the problems faced by upper- and middle-class individuals. Finally, income is an inconsistent measure of social class due to short-term variations and unreliable reporting (Bronstein et al., 2003).

Another difficulty with using social class in school counseling is that variables such as income, occupation, and educational level are common indices of social class, but the relationship between the three indices is small, and there are no data to suggest how a social class group might be affected by any combination of the indices (M. T. Brown et al., 1996; Liberatos et al., 1988). An additional problem is that these indices are primarily "adult" symbols of social class, which implies that children and adolescents do not have a social class apart from their parents, and by extension, do not experience classism. Research shows, however, that children and adolescents are highly attuned to

social class messages, and that they experience and participate in various forms of classism (Carter, 2003; Goldberg, Gorn, Peracchio, & Bamossy, 2003; Goodman et al., 2000; Roberts, Tanner, & Manolis, 2005; Wood, 1998). Tudor (1971) found that children as early as the first grade developed social class awareness. Tudor studied 216 first-, fourth-, and sixth-grade students in a public school system, with ages ranging from 6 to 13. They were presented with a task of grouping pictures of objects (e.g., houses and cars) into upper, middle, and lower classes. Results showed that first-grade children could classify groups accurately, and by the sixth grade, children were nearly perfect in their classifications.

Issues of social class and classism are also widely present in children's daily activities and interactions; the following case vignette illustrates how such issues are likely to play out in a typical situation, as well as the social and psychological effects that are likely to ensue.

> John is a White, 12-year-old seventh grader whose family recently moved from a large city to one of its suburbs so that he could attend a better public school. The community he lives in is predominantly White and upper-middle-class; most of his classmates' parents work in white-collar jobs and have above-average incomes. John's own parents are employed as a bank teller and a teacher, and the family lives in one of the few apartment complexes in the community, which is dominated by single-family homes. After moving, John met some new friends at his apartment complex and on the sports teams that he joined at school, and spent time socializing with both groups; however, he soon began to find it difficult to fit in equally well with both sets of friends. When he wore khakis and sweaters like his friends on the basketball team, the kids at the apartment complex cracked jokes about his "preppy" clothes, but if he came to practice wearing an old T-shirt and jeans, the other players said that he looked like a bum. When he hung out at the mall with his basketball friends, the kids in his building accused him of being snobby, but if his teammates walked by as he and his friends sat on the steps of their complex, they joked about how "ghetto" he looked. Soon, John found himself dreading the prospect of being around members of both social groups at the same time and began to avoid situations where this might happen. He felt exhausted by his efforts to juggle the two groups' demands for appropriate behavior and appearance, and was constantly stressed out by their continuous jeering at his failures to conform to group norms. Although he liked both sets of friends, over time, John began to decrease his contact with the kids in his building and to spend most of his time with his teammates in order to avoid the stress of trying to fit in with both groups. Eventually, his friendships with his neighbors faded completely, and the basketball team became his primary social network.

This vignette demonstrates that children and adolescents are not only aware of social class, but also use it to form judgments about others and to make decisions about their own behaviors and choices of friends. All of John's friends' taunts stemmed form their sensitivity to subtle indicators of his social class, such as his clothing and recreational activities; moreover, the upward and downward classism that John experienced caused him substantial distress, and eventually forced him to modify his behavior and even abandon some of his friendships. This example also suggests that school counselors should be aware of the indicators of social class that are relevant to the children in their schools and must keep in mind the powerful influence that social class issues can have on students' behaviors and psychological well being.

Because social class is important in the lives of children and adolescents, it is imperative for school counselors to better understand its role in their work. While school counselors are employed in a number of different settings with varying responsibilities, we will focus on two issues especially pertinent in school counseling practice: (a) developmental guidance and (b) vocational development.

Developmental Guidance

Of all the tasks school counselors tackle, one of the most important in relation to academic achievement is developmental guidance in the classroom (Lapan, Gysbers, & Sun, 1997; Whiston & Sexton, 1998). The use of a counseling paradigm and the application of teaching theories, human developmental theories, and counseling theories are important frameworks in implementing developmental guidance (Goodnough, Perusse, & Erford, 2003). The school counselor provides direct (e.g., counseling) and indirect (e.g., consultation) services to assist teachers with the delivery of lesson plans, the implementation of discipline, and the creation of a positive school climate (Sink, 2005). Thus, school counselors become increasingly important "teachers" within the classroom (Goodnough et al., 2003).

Developmental guidance, which uses traditional developmental theories to inform and guide school counseling practice, helps facilitate our understanding of how social class may impact a child's or an adolescent's development. The extant literature on developmental guidance, however, typically suggests targeted interventions for different

grade levels (e.g., behavioral or cognitive goals), but does not reflect how social class operates at the societal, family, or interpersonal levels. That is, the interventions are given irrespective of the resources to which teachers have access, the social class variations in parent–teacher interactions, and the effects of poverty on the cognitive and intellectual development of children and adolescents. Thus, the literature on developmental guidance, especially developmental theory, has largely ignored the role social class plays in the trajectory of children's and adolescents' cognitive, social, and personal development.

The problem with a developmental approach that does not integrate social class into its interventions or program structure is that what is likely to blame the child or adolescent for failing to achieve or to actualize the programs available to him or her. For instance, imagine a developmental guidance approach that is not race-sensitive or attuned to how teachers, especially middle-class teachers, view African American students. Under such an approach, a program might be established to raise the intellectual performance of African American students in an elementary classroom, but may fail to achieve the desired goal. Without an understanding of the interaction between social class and race, one conclusion might be that the program did not work because the African American students are intellectually deficient.

Research overwhelmingly shows, however, that this conclusion would be wrong. To begin, unfavorable attitudes from White teachers toward African American students depress standardized test scores (Oates, 2003). McLoyd (1998) and Evans (2004) have also shown that child and adolescent achievement is influenced negatively by poverty and low social class. Beginning at the perinatal stage and onward, complications stemming from stress, violence, exposure to toxins such as lead, and a lack of home-based cognitive stimulation all contribute to limiting intellectual and socioemotional functioning (Costello, Compton, Keeler, & Angold, 2003). Job loss or unemployment, persistent poverty, and exposure to violence also impact the psychological well being of parents, which in turn influences the child's or adolescent's sense of self (Farmer et al., 2004; McLoyd et al., 1994; Nagin & Tremblay, 2001; Petterson & Albers, 2001). Furthermore, research shows that low teacher expectations, along with poor academic readiness, contribute to low school achievement. The cocurricular and home environments and resources contribute to the intellectual progress of students. Entwisle, Alexander, and Olson (1997) found that home resources, such as books and computers, contribute to children's intellectual gains, especially when school is not in session. Parental involvement in the school and consistent parental discipline are also related to fewer absences and higher grade point average (Gutman, Sameroff, & Eccles, 2002). However, not all families have access to these resources, or the ability to provide optimal levels of parental involvement and structure.

There are also differences within classrooms, depending on context. For instance, Greenwood, Delquadri, Stanley, Terry, and Hall (1986) found that inner-city teachers typically used more audio–visual materials and teacher–class discussions, whereas suburban teachers assigned more independent work and more sustained study time. Consequently, inner-city children tended to have lower levels of teacher–student interaction and to be more passive when compared with suburban children. Therefore, when providing developmental guidance, school counselors need to be sensitive to the possible social class issues among students and to the impact of social class on the particular school and community. These factors affect the way families interact with society, the way they deal with the conflict and crisis that result from poverty, the way children come to school, and the expectations that teachers and school counselors have for parents.

School counselors should also be aware of communication differences between students and parents from different social class groups. For instance, children in lower social classes report more negative interactions with parents than children in higher social classes (Chen, Matthews, & Boyce, 2002). Hence, some of the low social class children may be more sensitive to criticism from teachers and counselors than other children are. Additionally, low social class parents tend to focus on obedience, respect, neatness, cleanliness, and staying out of trouble, whereas high social class parents focus on happiness, independence, creativity, curiosity, ambition, and self-control (Maccoby, 1980). Lower social class parents are also more power-assertive, authoritarian, controlling, and willing to use physical punishment in comparison with higher social class parents who tend to be democratic and permissive or authoritative (Maccoby). Finally, in contrast with parents from low social classes, parents from high social classes may reason and use complex language with their children (Maccoby).

All of these social class differences have implications for school counselors. The lower class children and adolescents with whom counselors work may expect direct and autocratic communication from teachers and may need help in understanding democratic or permissive language. School counselors should also help to develop behavioral contingencies for difficult-to-control children who avoid power-assertive techniques and focus only on control and avoidance of trouble.

Vocational Guidance

Another important role a school counselor plays is in providing vocational guidance (Baker, 1996). Vocational guidance

can happen as part of vocational development and school-to-work transitions. In this role, school counselors provide reliable information about jobs and careers, help make appropriate vocational choices, and provide opportunities to explore various occupations (Baker). D. Brown (2003) provided several examples of developmentally appropriate career goals for each school class level. At kindergarten, children may be expected to identify their parents' jobs and duties. At third grade, they should identify five workers employed by the state and know their major responsibilities. By middle school (eighth grade), students may identify three interesting jobs and determine the skills and education needed for those jobs. By high school, adolescents may want to make a preliminary career choice, identify alternative career choices, and construct a path to obtain each career. Although helpful in the ideal, these suggestions are premised on a middle-class context where children and adolescents have opportunities and options to investigate. The other assumption is that children and adolescents develop career interests and goals that are independent of their parents and community; however, as we will discuss later, Rasheed (2001) found that these career goals might not be accurate or helpful, especially among some lower class and rural youth.

The primary limitation of contemporary career theories and research is that they are based mostly on the experiences of White and middle-class populations (Chaves et al., 2004). Buboltz, Miller, and Williams (1999) found in a content analysis of the *Journal of Counseling Psychology* that many of the participants in the studies were college students, even though only 25% of the United States population has a college education (U.S. Census Bureau, 2001). Many other studies on which career theories are based also rely on samples that are not representative of all segments of the population in terms of race, gender, or social class. Given these limitations, current career theories, many of which are used by school counselors, may have limited applicability to poor and working-class groups.

Some research shows that current career theories may have to be adapted for non-middle-class students. For instance, some research suggests differences between senior high school students from low and high social class groups in terms of investigating and planning for college. Low-income, ethnic minority, high school students are similar to higher-income White students with respect to future income expectations, especially in their expectations of returns on higher education (Rouse, 2004). The problem is that lower income, ethnic minority students are less able to translate their future plans, such as college, into actual college attendance (Rouse). Thus, school counselors need to be aware that barriers limiting higher educational attainment may be more pronounced for those in lower social class groups. Focusing simultaneously on overcoming these barriers and developing higher achievement motivation is imperative.

Work may also be differentially meaningful depending on the social class group of the child or adolescent. School counselors should be aware that adolescents from lower social class groups may approach career and job attainment differently than adolescents of higher social class might. For example, in Chaves et al.'s (2004) study of poor and working-class urban adolescents, the authors found that vocational education and exposure was expected to come through traditional school-to-work programs embedded in academic work in school. The premise of career theories is that people will find work that is meaningful, relevant, and rewarding. Yet, some poor and working-class individuals may not find work intrinsically rewarding or interesting. Chaves et al. found that high school students who lived in urban settings and were predominantly poor tended to view work as a means to make money, establish financial security, and keep themselves occupied; work was perceived by different students as enjoyable, boring, positive, and negative. In contrast, students from high social class groups tended to view work as a source of personal satisfaction and reported greater access to parental support and resources as well as higher levels of career adaptability (Blustein et al., 2002).

These results suggest that school counselors need to develop career programs and services that acknowledge the practical rewards of vocational choices as well as the potential intrinsic rewards of careers. Focusing specifically on the abstract and ideal goal of vocational choice (i.e., finding a career that is intrinsically rewarding) may be a social class bias that needs to be addressed before providing services. Additionally, school counselors should recognize the important role parents might play in students' career choices. Focusing on the students' career choices as independent and autonomous, without regard for the parents' wishes or support, may decrease the credibility and trustworthiness of the counselor.

Practice Implications

In this chapter, we have reviewed literature and critiqued theories relevant to school counseling practice. In addition to these reviews, practical examples and implications are also important in illustrating how school counseling practice can be informed by social class. In these examples, we will use the phenomenological/subjective approach to understanding social class in students' lives. This approach maintains that while income, education, occupation, and other "adult" indices are typically used to classify individuals into social class groups such as the middle class, research shows that people's perceptions of their situation

or condition are more important to their psychological well-being than the objective indicators (Liu, Ali, et al., 2004; Liu, Soleck, et al., 2004).

The framework used here is an abbreviated SCWM (Liu, 2002; Liu, Soleck, et al., 2004). The premise is that individuals live in economic cultures that socialize them into ways of living that sustain their social class standing. Materialism, lifestyle considerations, and social class behaviors such as accents and table manners, to name a few, are all symbols of a person's social class standing. People are motivated to maintain a homeostatic position in their social class group. As a result of this motivation for homeostasis, people also experience and enact various forms of classism. Upward classism, for instance, consists of prejudicial attitudes toward those perceived to be in a higher social class group than oneself; these individuals may be regarded as snobby, elitist, or stuck up. Downward classism is prejudice and discrimination directed toward those in lower social classes. Lateral classism is prejudice experienced as "keeping up with the Joneses"—people work to maintain their standing in relation to others in their social class group in order to avoid the negative judgments and prejudicial treatment they would receive if they fell behind. Finally, internalized classism is anxiety, depression, fear, and anger resulting from an inability or a failure to maintain one's social class standing.

Even though many examples could be derived from the SCWM, we will touch on only a few to illustrate the application of social class to informing the practice of school counseling. Several forms of classism are salient for students coming from impoverished, poor, low-income, and low social class situations. Career motivations to achieve, save money, or work in service occupations, such as fast food, are often sabotaged by poor peer interactions. For instance, Newman (1999) describes how poor and urban youth often feel shamed or demeaned by their peers for "just working." They experience upward classism when other poor adolescents perceive them as "snobs" and lateral classism when these peers pressure them to conform and not work. This situation often becomes the proverbial "crabs in a bucket," where any "crab" attempting to escape is pulled back down by the others and, as a result, no one can get out. In such cases, school counselors need to recognize the possible deleterious role that peer pressure may play in students' job attainment or career choices. Not all students are motivated toward job attainment, and not all students are interested in supporting their peers' success. Consequently, in counseling, it would be important to acknowledge the multiple tiers of pressure that students experience and the barriers that they face. A counselor who is aware of social class issues would attempt to understand the feelings of internalized classism as well as the pressures of upward, downward, and lateral classism in students' lives.

Students in all grades also experience materialistic pressures to conform to their peers. Dress codes and norms, often fluctuating and reflecting the mercurial aesthetics of the broader society, may be easier to subscribe to for those who have financial resources. For those lacking such resources, feelings of internalized classism such as depression, anger, and anxiety may arise. School counselors could work with administrators to examine the physical characteristics of the students' environment. They should be observant of dress norms, jewelry, cars, and other possessions that force stratification among different students in the school. Such stratifications may create tension, anxiety, and stress among some students, who may then express these feelings through withdrawal, anger, or frustration. In their work, school counselors should acknowledge how these material pressures affect the students. Furthermore, school counselors need to be constantly aware of the ways in which they might explicitly or implicitly reinforce social class stratification in their schools. Students of different social classes may have different normative experiences as well as differential access to academic activities and resources, such as field trips and extra books. Counselors should be sensitive to these differences and careful not to make assumptions about the resources that students can access or the experiences that they have had.

In general, school counselors should communicate to the students they work with that they empathize with them and share similar values and worldviews. Esters (2001) investigated students' preferences for counselor characteristics. A sample of 66 high-risk students from the southern United States completed the Preferences for School Counselor Characteristics Questionnaire, which requires a forced choice between two characteristics. The results suggest that students prefer to work with a counselor who possesses characteristics similar to their own. After rank ordering the characteristics chosen by the participants, Esters found that the two most desirable counselor characteristics were (a) same attitudes and values and (b) same background and socioeconomic status as the student. This finding indicates that students' preferences with regard to similarity are not based on overt, easily available physical characteristics. Rather, students prefer counselors with worldviews and past experiences that are similar to their own.

School counselors can also act as informed mediators among schools, families, and communities. Giles (2005) asserted that educators send messages to poor and working class parents that undermine the role of the parents in their children's education. Using a conceptual framework, Giles outlined the ways in which counselors and educators in urban schools perceive the quality and nature of their relationship with parents. Barriers in these relationships often form as a result of social class, race, and power differences between parents and educators, and the author sug-

gests that these barriers can be overcome by transforming the school–family–community culture from bureaucratic to relational. Giles suggested that parents and educators should strive for mutual interactions and assume mutual responsibility for the education of children. Going further, Bryan (2005) also addressed the need for school–family–community partnerships in order to foster resilience, build social capital (i.e., relationships), and make a positive difference in school achievement among ethnic minority and low-income children. According to Bryan, parents of these children are often regarded by educators as adversaries rather than supporters of their children's educations. Bryan suggested that barriers to low achievement can be overcome by fostering dialogue among educators, parents, and community members. School counselors may act as facilitators, advocates, or collaborators to help develop these necessary dialogues.

Although much research demonstrates the deleterious effects of poverty on children and adolescents, there is also evidence for the existence of certain protective factors that shield children from these effects and that can be used in planning and implementing school counseling interventions. For example, Lee (1999) found that supportive adult relationships were instrumental in boosting economically disadvantaged students' confidence and expectations of themselves and, thus, helped them to achieve academic and career success. Lee studied mentoring and its relationships with self-efficacy, aspirations, and ideas of future selves in disadvantaged students of various ages. The author explored the length of time that was required for mentoring relationships to significantly benefit the mentees. One hundred and thirty elementary- and secondary-school students participated in a mentoring program. Participants were mostly African American and were reported by the school staff to be economically disadvantaged. One group consisted of students on the waitlist for mentoring, another group of students had been mentored for 6 months or less, a third had been mentored for 7 to 12 months, and a final group had been mentored for more than 1 year. Lee found that aspirations were higher in students who had been mentored for more than 1 year when compared with students on the waitlist.

The results suggest that long-term mentoring is associated with more ambitious plans for future education and occupation in disadvantaged students. School counselors can therefore improve students' chances of future success by making efforts to establish long-term, consistent relationships with students, or by collaborating with other important mentors in the students' lives, such as parents and teachers, in their efforts to promote academic success. Although it is not feasible for school counselors and teachers to provide all students with the support and guidance they need and deserve, these individuals provide an important link between students and other potentially helpful community-based programs. Research has documented the benefits of mentoring programs (e.g., Big Brothers/Big Sisters) in promoting positive attitudes and healthy behavior and in reducing self-destructive, risk-taking behavior (Rhodes, Grossman, & Resch, 2000). Research on the effectiveness of the Big Brothers/Big Sisters program has noted the following benefits among mentees: a lower likelihood of initiating drug or alcohol use, more self-confidence with regard to schoolwork, better attendance, improvements in perceived scholastic achievement, and better relationships with parents, families, and peers (DuBois, Neville, Parra, & Pugh-Lilly, 2002). Given the potential for such extrafamilial relationships to provide benefits for at-risk youth, it is important for school counselors to work with parents and teachers in providing suitable recommendations and referrals.

One specific intervention that school counselors might consider in working with lower class students is to provide etiquette classes that focus on dining and socializing. This intervention may be particularly useful for counselors working with high-school seniors in school-to-work transition programs. Many of these students may find themselves in job interviews or performance evaluations that require dining with current or prospective employers in formal or semiformal settings. The goals of the etiquette class would be to reduce the students' anxiety and increase feelings of competency and self-efficacy in such situations; this could be accomplished by teaching specific skills relevant to the situation, such as ordering, dining, and formal socializing.

A final suggestion for school counselors is to be aware of their own social class backgrounds, assumptions, and prejudices. It is particularly important to avoid upward mobility bias (Liu & Pope-Davis, 2003), which is the belief that everyone is motivated toward upward social mobility (e.g., to gain a higher education or get a better job). In her dissertation work among Appalachian high-school youth, Rasheed (2001) found that many in this poor, rural community decided not to go to college or seek other postsecondary training. Instead, they intended to work in occupations associated with coal mining or other community jobs. Rasheed reported that these students' primary value was to stay close to their families; they were not interested in upward mobility as defined by conventional society. For these students, coal mining and service work were not seen as mundane or uninteresting, but as honorable and honest forms of work. Cases such as this illustrate how important it is for counselors to avoid making assumptions about others' social class related values and aspirations based on their own views or experiences.

In the following case vignette, we will synthesize several of the issues pertinent to school counseling intervention.

Marilyn is a school counselor working in a rural Midwestern high school, where she has been employed for eight years. A new manufacturing company was recently established in the town, bringing with it several hundred new families, most of whom were Hispanic and poor. With the addition of new students, Marilyn faced new challenges as a middle-aged, middle-class Caucasian school counselor, who had, until recently, worked primarily with White, middle-class students. Namely, Marilyn noted an increased incidence of bullying among the female students: It appeared that a popular "clique" of Caucasian girls was singling out, teasing, and ostracizing several of the new Hispanic girls. As a result, the new girls were cutting classes or not coming to school at all, homework was late or not turned in, and many had been seen in the nurse's office with complaints of physical ailments. Marilyn spoke with the girls individually, in an attempt to gather information about their predicament, as well as to express her concern. She knew that to be successful in communicating with the girls, she would have to identify some way in which she could share their worldviews and experiences. Rather than speaking directly about race or class, Marilyn attempted to drawn common ground via her own experience as an adolescent girl. She shared her memories of high school, remembering that other girls had always seemed to have nicer clothes and books; their parents dropped them off in newer cars; and they seemed to speak properly and effortlessly with teachers and other students. Marilyn encouraged the girls to talk with their parents and to become involved in activities in the community that were not directly school-related, such as 4-H. In doing so, she hoped the girls could begin to establish other friendships and bolster their social support networks. Marilyn also suggested that the girls become mentees in the Big Brothers/Big Sisters program and described to them the potential benefits of having someone to talk to who was not a parent. Throughout her work with the new students, Marilyn knew to be aware of her own values and background, and the way in which these could influence counseling. In turn, Marilyn asked the girls to describe their own beliefs and values to her. Over the course of the year, Marilyn developed important relationships with the girls that provided both support and information about community resources.

The previous vignette demonstrates how a school counselor can provide important guidance and direction for youth in a sensitive and empathetic manner. In addition, the vignette demonstrates the importance of the role of the school counselor as a mediator among school, family, and community, and as a referral source for adolescents to other supportive adult relationships.

The Subjective/Phenomenological Approach to Social Class

Much of the research evidence we have reviewed in this chapter supports moving to a subjective/phenomenological approach to social class. The literature shows that the subjective experience of poverty mediates the effects of poverty on psychological outcomes (McLoyd et al., 1994). The way an individual sees his or her current situation and makes meaning of poverty affects that person's psychological outlook and well-being. For instance, one person with a 10th-grade education and an income of $25,000 may blame herself for underachieving and feel constantly stressed out, while another with the same education and income may be happy and consider himself lucky to be free of the burden of managing large amounts of money and possessions. While these two individuals' objective social class status is the same, their perceptions of their situations, and the resulting psychological outcomes, are very different. A phenomenological approach to social class captures important subjective differences such as these. It also allows researchers to investigate situational nuances that are not apparent from a classification scheme. For example, Carter's (2003) qualitative analysis of 44 low-income African American youth in an urban school revealed that they often struggled to balance two different forms of cultural capital in maintaining their social class status. Cultural capital is the standards of speech, dress, musical tastes, and ways of interacting that distinguish between one group and another. The African American students struggled between African American cultural capital and the dominant cultural capital (i.e., White and middle class), which was believed to lead to success. The study of this and other subjective social class phenomena is impossible if social class is measured solely by objective indices; however, a phenomenological approach allows us to examine the attitudes, conflicts, and other psychological processes involved.

Summary and Conclusions

The purpose of this chapter was to provide an overview of social class in school counseling. Although social class is an important contextual variable in students' lives that affects them in many ways, it is difficult to understand

and integrate into research and practice. Social class is also often confounded with ethnicity, although this presents more of a problem for research than practice, where it is more important to understand the interaction between the two variables than to tease them apart. The literature reviewed in this chapter shows that various measures of social class, such as income, education, and occupation, are related to numerous indicators of child development, intellectual performance, and socioemotional functioning. Typically, the lower the social class of the family, the poorer the outcomes for children and adolescents. The authors also examined the role of social class in two major services provided by school counselors: (a) developmental guidance and (b) vocational guidance. The available evidence highlights the importance of integrating social class considerations into both services; otherwise, school counselors may find their work catering only to White, middle-class students while ignoring everyone else. The chapter concludes with some practice implications that illustrate how social class can be used to inform the work of school counseling. We hope that this discussion will help school counselors become aware of their own biases and worldviews when working with students of low social class and aid them in developing better programming for these students.

XII
DISABILITY IN THE SCHOOLS

TINA M. ANCTIL AND STEPHANIE SAN MIGUEL BAUMAN
Washington State University

Introduction

Special Education Services Today

Since the landmark passage of P.L. 94-142, the Education of All Handicapped Children Act (1975), which guaranteed all children with disabilities a free, appropriate public education (FAPE), children with disabilities have been attending public schools. Prior to this legislation, children with disabilities were largely uneducated, residing in institutions or with family members. Today, the inclusion of students with disabilities in the general education classroom signifies a true revolution has occurred within education over the past 30 years as 95% of students with disabilities are now served in general education classrooms (U.S. Department of Education [USDE], 2002).

In the 2001–2002 school year, over 5 million school-age children, or 9% of the U.S. resident population of school-aged children, had been identified as requiring special education services due to specific disabilities. The most common disabilities represented in U.S. schools are specific learning disabilities, speech or language impairments, mental retardation, and emotional disturbance. Of those students, White students made up 62.3% of the students served; 19.8% were African American; 14.5% were Hispanic; 1.9% were Asian/Pacific Islander; and 1.5% were American Indian/Alaska Native (see Table 12.1; USDE, 2002). There continues to be overrepresentation of disabilities in some racial/ethnic groups according to specific disability categories, as well as under representation of certain disabilities in some racial/ethnic groups, when compared with the special education student population as a whole.

Research on the educational outcomes of students with disabilities is disappointing, with 31% of adolescents with disabilities dropping out of high school; this rate is much higher than for nondisabled adolescents (Phelps & Hanley-Maxwell, 1997; USDE, 2000). Unemployment rates for young women with disabilities are over four times the rates for nondisabled young women, while unemployment rates for young adult males with disabilities are approximately three times the rate for their nondisabled peers. Additionally, youth with disabilities attend postsecondary education or training at much lower rates than do nondisabled young adults (USDE, 2000).

The Inclusion Movement

Today, P.L. 94-142 has been amended five times and has evolved into the Individuals with Disabilities Education Act (IDEA), with the most recent amendments passed in 2004 renaming the legislation the Individualized Disability Education Improvement Act (IDEA). The amendments of 1997 (P.L. 105-107) were particularly significant in creating a renewed focus requiring that children with disabilities be guaranteed the "least restrictive environment" for learning while also addressing the importance of a thorough evaluation for services (including diagnosis by qualified professionals), individualized education programs for each student, student and parent participation in decision making, and the procedural safeguards to ensure that the regulations and the rights of students with disabilities are being followed. Furthermore, the 2004 amendments align IDEA closely to the No Child Left Behind Act, helping to ensure equity, accountability, and excellence in education for children with disabilities.

Table 12.1 Percentage of Students Ages 6 through 21 Served Under IDEA During 2000–2001

Disability	American Indian/ Alaska Native	Asian/ Pacific Islander	Black (non-Hispanic)	Hispanic	White (non-Hispanic)	All Students Served
Specific learning disabilities	56.3	43.2	45.2	60.3	48.9	50.0
Speech or language impairments	17.1	25.2	15.1	17.3	20.8	18.9
Mental retardation	8.5	10.1	18.9	8.6	9.3	10.6
Emotional disturbance	7.5	5.3	10.7	4.5	8.0	8.2
Multiple disabilities	2.5	2.3	1.9	1.8	1.8	2.1
Hearing impairments	1.1	2.9	1.0	1.5	1.2	1.2
Orthopedic impairments	.08	2.0	0.9	1.4	1.1	1.3
Other health impairments	4.1	3.9	3.7	2.8	5.9	5.1
Visual impairments	0.4	0.8	0.4	0.5	0.5	0.4
Autism	0.6	3.4	1.2	0.9	1.4	1.4
Deaf-blindness	0.0	0.0	0.0	0.0	0.0	0.0
Traumatic brain injury	0.3	0.3	0.2	0.2	0.3	0.3
Developmental delay	0.7	0.6	0.7	0.2	0.6	0.5
All disabilities	100.00	100.00	100.00	100.00	100.00	100.00

Of increasing importance to school counselors is Section 504 of the Rehabilitation Act, originally passed in 1973 as the first Civil Rights law that prohibited discrimination on the basis of disability. Specifically, this law required that all federally funded entities (e.g., schools, libraries, universities, local and state government agencies) provide physical as well as programmatic accommodations for people of all ages with disabilities. Many students with health impairments that do not interfere with classroom learning, such as juvenile diabetes, receive 504 accommodations instead of IDEA related services.

Notably, IDEA and Section 504 differ in their focus, goals, and funding. IDEA emphasizes educational remediation and attempts to address gaps in skills and abilities by providing modified instruction and additional services for students in need of special education. Section 504 focuses on the prevention of discrimination. It attempts to level the playing field for students who can succeed academically if their disabilities do not limit their access to learning. IDEA is a funded law, while Section 504 is not (Lockhart, 2003).

The latest flagship regular education law, No Child Left Behind (NCLB), was authorized in 2002, replacing the Elementary and Secondary Education Act (ESEA) and bringing broad changes to U.S. educational systems. While not a special education law in particular, NCLB does have significant impact on students with disabilities, especially in the terms of assessment. Building on IDEA, NCLB requires schools to measure how well students with disabilities have learned reading and mathematics curricula. The law includes provisions for students with the most significant cognitive disabilities, allowing for designed alternate assessments when appropriate. Because the majority of students with disabilities are required to meet the academic achievement goals of their schools, they must also have access to the general education curriculum. Assisting and advocating for students with disabilities to have adequate access to the general education curriculum are crucial roles for school counselors and will be discussed in greater detail later in the chapter.

Another point of consideration for school counselors is the unique educational and environmental differences between rural, suburban, and urban settings for students with disabilities. Kinnison, Fuson, and Cates (2005) summarized the most common barriers to special education students in rural settings as access to qualified and skilled special education instruction and a lack of future employment opportunities. Similarly, students in some high-poverty urban areas may also lack adequate access to specialized instruction. As school counselors engage and collaborate with special educators, it is imperative that they inquire about issues that may be unique to the school setting or community, allowing the counselor to design interventions that supplement the work of the special educators (e.g., a community that lacks adequate child psychologists may benefit from a school counseling program that offers group counseling for students with specific issues).

School Counselors and Students With Disabilities

In summary, school counselors need to understand that these laws mandate the education of students in the most inclusive setting possible. Understanding how school counseling practices fit into the national legal mandates for students with disabilities provides a framework for implementing comprehensive counseling and guidance programs across grade levels.

School counselors play a unique and varied role in supporting the personal/social, academic, and career development needs of students with disabilities. Despite the importance of the school counselor to this population, there is a dearth of literature on school counseling and students with disabilities in the school counseling literature. This chapter will address how school counselors can support the individual needs of the student with a disability through individual counseling, interdisciplinary teamwork, and family-oriented counseling and services. Key theories that impact students with disabilities (i.e., adjustment to disability, self-determination theory, and Social Cognitive Career Theory [SCCT]) will be discussed, as well as pertinent research and example of practice for each. Ethical and legal issues that pertain to school counseling practice and students with disabilities will be covered. Finally, recommendations for training future school counselors to meet the needs of students with disabilities will be addressed.

Theory

Personal and Familial Adaptation to Disability

School counselors who are knowledgeable about the factors that influence students and their family's response to disability are better prepared to meet the educational needs of students with disabilities. Referring again to Table 12.1, the most common disabilities found in schools today are specific learning disabilities, speech or language impairments, mental retardation, emotional disturbance, and other health impairments. In addition to students with disabilities, school counselors may encounter students who have a parent or a sibling with a disability. Understanding the basic theoretical construct of adaptation to disability and psychosocial functioning as it relates to the disability and the family is foundational to providing counseling services to this population.

What is the psychosocial impact of having a disability? One way of answering this question is to evaluate the many factors that interact with the disability. Despite considerable agreement in the literature that the onset of a chronic illness or physical disability constitutes a "crisis-like" situation in the lives of affected individuals, there continues to be considerable disagreement regarding the nature, process, and outcomes of adaptation to chronic illness or disability (Livneh, 1986; Shontz, 1975; Siller, 1976; Wright, 1983). It is generally agreed that there are changes in *self-representation* (i.e., sense of self, self-identity, body image) following the onset of a disability or the diagnosis of a chronic or life-threatening medical condition. There is little agreement, however, regarding the psychosocial factors that contribute to changes in self-representation (Livneh & Antonak, 1997).

In a review of the literature of ecological models of psychosocial adaptation to disability, Livneh and Antonak (1997) identified four primary classes of variables important to understanding variations in the process of psychosocial adaptation. The first class of variables are those associated with the specific disability (e.g., cause of condition, type of disability, type of onset, extent of condition, degree of functional involvement, body areas affected, extent of brain and central nervous system involvement, age at diagnosis, age of symptom onset, chronicity, stability of condition, lethality, and visibility). For example, a second-grade student diagnosed with juvenile diabetes encounters a very different set of variables than another second grader who suffers a severe head injury. Both families will be deeply affected, but in different ways. The family of the student with a head injury likely dealt with a life-threatening accident and the ensuing days or weeks of inpatient treatment and rehabilitation. On the other hand, the family of the student with juvenile diabetes may be working extensively with a diabetes educator to learn to administer and manage insulin, adjust to a new diet, and facilitate their child's understanding of the illness. Both families will have long-term worries about their child's future health and will need accommodations from the school to meet the disability related needs of their child, but each has a unique set of needs that the school must address and negotiate.

The second class of variables important to understanding variations in the process of psychosocial adaptation is associated with sociodemographic and organismic characteristics of the individual, including (a) sex and sex role identification, (b) chronological age, (c) life or developmental stage, (d) ethnicity, (e) socioeconomic status, (f) state of general health, (g) level of education, (h) marital status, (i) occupational attainment and job history, and (j) existing vocational skills. While these variables apply primarily to adults, the school counselor should be aware of them in the event that a parent of a student has an existing disability or obtains a new disability. For example, when a parent is injured on the job, the family's socioeconomic status may decline, causing marital discord, which could then impact the student's ability to academically achieve and/or result in behavioral problems at school.

Next, variables associated with personality and behavioral attributes of the individual can impact the psychosocial functioning of the individual. The coping strategies and defense mechanisms employed can be either negative or positive. The individual's perception of control, whether internal or external, can be critical to developing internal motivation and self-determination. Other examples of personality and behavioral attributes include (a) the personal meaning of the condition; (b) attitudes toward health, sickness, and deviance; (c) personal values and beliefs; (d) self-concept and ego strength; (e) body image; (f) cognitive competence or intellectual ability; (g) acceptance of disability; (h) premorbid psychosocial adaptation (i.e., before the occurrence of the disability); and (i) previous experience with crises of a similar nature. Developmentally, certain variables such as self-concept may be experienced quite differently depending on the age and grade level of the student. An elementary school student may not internalize the label of "learning disabled" in the same way as a middle school student diagnosed with a learning disability.

Finally, variables associated with the physical environment should be considered. Examples of this include the individual's access to social support systems, economic and institutional support, physical settings, attitudinal barriers or supports, and encountered stress. For children and adolescents, the primary environment is the family, which ultimately can dictate how each of these variables will interact with each other. For these reasons, it is particularly important that the school counselor include the family in as many interventions as possible related to psychosocial adjustment to disability.

Self-Determination Theory

Beginning in the 1980s, research regarding the factors and supports that may contribute to adult success for students with disabilities became a priority for special education researchers and policy makers (Kohler, 1993). One of the most significant findings from outcomes research has been the link between high levels of self-determination and positive adult outcomes (Gerber, Ginsberg, & Reiff, 1992; Reiff, Gerber, & Ginsberg, 1997; Wehmeyer & Schwartz, 1997). Research on self-determination as a motivational construct has highlighted the importance of promoting educational practices that lead to enhanced internal motivation for students with disabilities, which is also of great interest to school counselors.

Given these findings, the U.S. Department of Education created a series of national model demonstration projects to promote self-determination for youth with disabilities. With ever-increasing evidence that self-determination is essential for successful adult outcomes for youth with disabilities today (Sowers & Powers, 1995; Wehmeyer & Lawrence, 1995), there is clearly an assumption that higher levels of self-determination will lead to a better quality of life in adulthood. While most, if not all, of these demonstration projects focused on special education services, school counselors can work to support and supplement the special education services that promote self-determination by incorporating practices that enhance self-determination into comprehensive counseling and guidance programs.

There are many definitions of self-determination, all similar in nature. Field and Hoffman (1994) defined self-determination as "the ability to identify and achieve goals based on a foundation of knowing and valuing oneself" (p. 164). Deci and Ryan (1985) described self-determination as "the capacity to choose and to have those choices be the determinants of one's actions" (p. 38). Ward (1988) identified five traits underlying self-determination: (a) self-actualization, (b) assertiveness, (c) creativity, (d) pride, and (e) self-advocacy. In addition, Wehmeyer (1996) defined self-determination as "acting as the primary causal agent in one's life and making choices and decisions regarding one's quality of life free from undue external influence or interference" (p. 24).

Wehmeyer (1995) identified the four essential characteristics of self-determined behavior as (a) behavioral autonomy, (b) self-regulated behavior, (c) psychological empowerment, and (d) self-realization. Wehmeyer (1993) studied the relationship between several of these elements and found that adolescents with learning disabilities and mental retardation had more barriers to effective career decision making (e.g., self-regulation) than their nondisabled peers had. Additionally, internal locus of control (i.e., psychological empowerment) was strongly related to positive career decision making for all students. Wehmeyer and Kelchner (1995) examined problem solving (i.e., self-regulation) in social contexts with youth with mental retardation and found that they created fewer and less complex solutions. Locus of control orientation, self-efficacy, general self-esteem, and problem solving and self-concept, which are both measures of self-realization, contributed significantly to the variance among total problem solving scores. These findings suggest that the four elements of self-determination may be related but are also distinct in their contribution to the construct of self-determination (Wehmeyer, Kelchner, & Richards, 1996).

Research clearly states that self-determination is a developmental process that must begin well before students leave high school (Sands & Doll, 1996; Whitney & Moloney, 2001). Teaching students with disabilities to become more self-determined to identify and reach goals, to evaluate personal preferences and decisions, to solve problems, to self-evaluate performance, and to assume greater control over their lives are key building blocks to becoming successful adults. In fact, these skills are important for all students; however, as illustrated by the drop-out rate and poor

employment rates of young people with disabilities, learning these skills is imperative for students with disabilities.

Social Cognitive Career Theory

Social Cognitive Career Theory (SCCT) was designed to promote understanding of the career development of a wide variety of students and workers by considering factors such as age, gender, race/ethnicity, culture, socioeconomic status, and disability status (Lent, 2005). The primary foundation for SCCT is Bandura's (1986) general social cognitive theory. Thus, SCCT emphasizes the complex mutual influence of people, their behavior, and their environments. Acknowledging that people possess the capacity to direct their own vocational behavior, SCCT considers three "person variables": (a) self-efficacy beliefs about one's capabilities (i.e., "Can I do this?"); (b) outcome expectations about the imagined consequences of particular courses of action (i.e., "If I try doing this, what will happen?"); and (c) personal goals regarding engagement in a particular activity or the production of a particular outcome (i.e., "How much and how well do I want to do this?"). SCCT also proposes conceptually distinct yet interlocking models for the following processes: (a) the development of academic and career interests, (b) the formation of educational and vocational choices, and (c) the nature and results of academic and career performance. In other words, the basic theoretical person elements (i.e., self-efficacy, outcome expectations, and goals) will operate in concert with other important aspects of the person (e.g., gender, race/ethnicity, and disability status); their contexts; and their learning experiences in the interest model, the choice model, and the performance model. In the process, academic and career development is shaped (Lent).

In discussing the practice implications of Social Cognitive Career Theory (SCCT), Fabian and Liesener (2005) commented that formal or informal assessment of efficacy beliefs and outcome expectations may be warranted with due consideration given to how these beliefs and expectations may have compromised an individual's interests, goals, and future expectations. Direct interventions could include strategies to bolster self-efficacy; to expose students to multiple career options and successful peer role models; to anticipate, understand, and address contextual barriers; and to build support systems (Fabian and Liesener, 2005).

Research

Personal and Familial Adjustment to Disability

Key themes in the seminal works of Shontz (1975), Roessler and Bolton (1978), and Wright (1983) suggest that adaptation to chronic illness is a "dynamic, gradually unfolding, and progressive process through which the individual strives to reach an optimal state of person-environment congruence regarded as adjustment" (Livneh & Antonak, 1997, p. 8). A person who has successfully reached a state of adjustment demonstrates (a) psychosocial equilibrium or reintegration, (b) awareness of remaining assets and existing functional limitations, (c) positive self-esteem and self-concept, (d) a sense of personal mastery, (e) successful negotiation of the environment, and (f) active participation in social, vocational, and recreational activities.

Because not all persons with disabilities reach this optimum level of adaptation, researchers (Livneh, 1986; Wright, 1983) have suggested that the adaptation process may also be conceptualized as a one-dimensional continuum ranging from failed adaptation (i.e., maladaptive psychosocial functioning) to successful adaptation (i.e., adaptive psychosocial functioning). The maladaptive end of the pole is characterized by the early reactions to disability, described in stage theories as shock, anxiety, and denial, while the adaptive end of the pole is characterized with the later reactions of acknowledgement, acceptance, and adjustment.

Behavioral correlates in the research have found behaviors such as problem solving, information seeking, and social support seeking are helpful to individual coping and can be viewed as a general reflection of successful psychosocial adaptation. Meanwhile, behaviors such as self-blame, avoidance, or externalizing blame are indicative of failed psychosocial adaptation (Livneh & Antonak, 1997).

Self-Determination Theory

Because the research on self-determination has identified self-determination as a positive predictor of adult success, many studies have focused on the federally mandated practice of individualized transition planning (ITP), which is required for all special education students beginning at age 14. The special education teacher is the identified party responsible for completing the transition plan (as well as the individualized education plan, or IEP); however, the school counselor is often identified as a key team member for the implementation of the individual student's plan. For example, if a student has a goal related to career exploration, the school counselor may facilitate a series of job shadowing experiences with local businesses.

Transition planning has been discussed as a dynamic vehicle by which students with disabilities can become empowered to identify and reach short- and long-term goals based on individual strengths and weaknesses (Blalock & Patton, 1996). Furthermore, many believe that self-determination is a skill that must be taught, and if education and transition goals are to address self-determination, the goals should be specific, systematic, and sequential (i.e., they

should include the many small steps required to reach the main goal) to allow the student to practice self-determination (Hughes et al., 1997; Stowitschek, Laitinen, & Prather, 1999; Wehmeyer & Kelchner, 1995).

For students with developmental disabilities, studies that imbed early self-determination opportunities (such as choice making) have shown promise for eventually generalizing the skills outside of the classroom and in unique situations (Stowitschek et al., 1999). A broader review of transition practices, which are empirically and socially validated (Hughes et al., 1997), identified strategies that support students in their preparation to leave high school. Overall, these strategies can be characterized into those that "emphasize building supportive environments, assessing and teaching choice and preference, and increasing self-management, independence, social interaction, and social acceptance" (p. 10).

In addition to imbedding self-determination into the transition planning process and the classroom, Agran (1997) described the importance of student-directed learning strategies in the classroom as a means of enhancing self-determination. He contended that student-directed learning strategies facilitate skills acquisition, save teachers time, promote generalization, and promote the cultural benefits of education. Wehmeyer, Agran, and Hughes (1998) added that there is no better setting for student-directed learning than the educational and transition planning processes in special education.

Whitney-Thomas and Moloney (2001) studied student self-definition as a component of self-determination in adolescents with and without disabilities. Using cognitive psychology as a basis for their study, they proposed that in order for adolescents to develop self-determination, they must first have a positive future orientation with the cognitive tools necessary to explore and form a healthy self-identity. They maintained that in order for adolescents to expand their identities, they must first be challenged by their environments (e.g., school) in a manner that does not "overwhelm the current capacities of the adolescent . . . resulting in high levels of distress and disorder" (p. 376). They theorized that in many adolescents with disabilities, the transition from high school becomes too overwhelming and therefore results in poor individual outcomes.

Whitney Thomas and Moloney's (2001) results indicate that "students' self-knowledge and visions for the future develop from introspection, learning from mistakes and choices made, and interactions with significant others across contexts such as family life and school" (p. 385). They found social support and opportunities for independence to be mediating factors in the development of self-definition, as well as in coping with stress. Students with disabilities were most likely to have low self-definition, to experience high rates of stress, and to struggle with development of their identity.

Social Cognitive Career Theory

In terms of research, self-efficacy has received the most attention among the variables in SCCT. Intervention, experimental, and path analytic studies support hypotheses regarding causal relations among measures of self-efficacy, performance, and interests (Lent, 2005). In the area of disability, researchers have used SCCT to examine career self-efficacy beliefs among students with disabilities compared with their nondisabled peers (Fabian & Liesener, 2005). For example, investigations of students with learning and emotional disabilities (e.g., Ochs & Roessler, 2001) have suggested that the participants with disabilities have lower efficacy beliefs than their peers without disabilities. Other studies suggest that self-efficacy beliefs play an important role in understanding students' career choice and interests (Fabian & Liesener, 2005). For example, Paganos and DuBois (1999) found that self-efficacy, rather than outcome expectancies, was the strongest contributor to career interests for high school students with learning disabilities.

In turn, Ochs and Roessler (2004), in an examination of 77 special education students diagnosed with learning disabilities and 99 general education students, revealed through a backward regression that both career decision self-efficacy and career outcome expectations were key predictors of career exploratory intentions in both groups. Fabian and Liesener (2005) also identified studies (e.g., Willis, 2002) that examined self-efficacy beliefs as significant predictors of postschool employment in students with serious emotional disturbance. A limited number of studies (e.g., Conyers & Symanski, 1998) have also looked at efficacy beliefs in the context of intervention studies and found positive results in regard to mitigating negative feedback of environmental constraints that have limited vocational development. These studies, however, looked at college students or adults rather than school-aged participants (Fabian & Liesener).

School Counselors and Students With Disabilities

School counselor preparation. Preparation of counselors to serve children and adolescents with disabilities requires the clarification of counselors' feelings and attitudes about working with students who have disabilities, as well as the acquisition of relevant knowledge and skills (Tarver-Behring & Spagna, 2004). Unfortunately, minimal guidelines for disability training are provided by the program standards of national accrediting agencies such as The Council for Accreditation of Counseling and Related Educational Programs and the National Council for Accreditation of Teacher Education (Milsom & Akos, 2003). In the absence of specific guidelines, a look at current school counselor preparation

may be instructive. For example, in their survey of school counselor education programs, Milsom and Akos found that 43% of the 137 participating school counselor education program coordinators reported that disability courses were required by their program, while 29% of the coordinators reported that elective disability courses were recommended. Milsom and Akos also found that information about disabilities often was integrated into existing program courses such as the basic school counseling course (integrated in 72% of the programs), the multicultural course (integrated in 64% of the programs), and the human counseling development course (integrated in 58% of the programs).

In terms of practical experiences, Milsom and Akos (2003) found that 26% of the school counseling programs required activities such as participating in an IEP, 504, or multidisciplinary meeting; consulting with teachers of students with disabilities; and/or providing individual counseling to a student with a disability. Moreover, in programs that did not specifically require involvement with individuals with disabilities, 55% of the program coordinators indicated that their students still became involved in experiences with, or that were related to, individuals with disabilities.

Activities school counselors perform with students with disabilities. The American School Counselor Association (ASCA) has encouraged school counselor involvement with students with disabilities (Milsom & Akos, 2003) and has recommended a variety of school counselor roles to that end (ASCA, 2000), 2004. In addition to providing school counseling activities that serve all students as part of a comprehensive school program, counselors may engage in other roles on behalf of students with disabilities. These roles may include the following: (a) serving on a school's multidisciplinary team; (b) assisting with the establishment, implementation, and modification of plans for accommodations; (c) collaborating with other student support specialists in the delivery of services; (d) providing group and individual counseling; (e) advocating in the school and in the community for students with special needs; (f) assisting with transitions between different grades and between school and postschool activities; (g) consulting and collaborating with staff and parents; and (h) making referrals to the appropriate specialists in the community (ASCA, 2004). Notably, professional school counselor roles may vary from school system to school system and from state to state due to the policies and regulations that state and local school boards may have in response to federal laws addressing students with disabilities (Lockhart, 2003).

In a survey of 100 randomly selected school counselors in elementary (28% of respondents), middle/junior high (38% of respondents), and high school (34% of respondents) settings, Milsom (2002) found that at least 75% the respondents indicated that they performed activities with students with disabilities. These activities included providing individual and group counseling, being a member of or providing feedback to multidisciplinary teams, and helping with behavior modification plans for students with disabilities. In turn, Wood Dunn and Baker (2002) surveyed 168 elementary school counselors in North Carolina. When asked to circle descriptors that best described what they believed about their role in working with students with disabilities, the percentage of participants who circled the following descriptors were as follows: counselor (92.9%), advocate (90.5%), listener (82.7%), team member (79.8%), consultant (78.6%), communicator (61.9%), and problem solver (55.4%). Wood Dunn and Baker concluded that the results of their research

> seem to depict a situation in which many school counselors acquired some formal education with students with disabilities prior to entering the profession. Yet, many may have found that the demands for them to possess expertise in this domain while working in the schools exceeded their perceived level of knowledge. (p. 282)

Practice

Counseling Services to Students With Disabilities and Their Families

The Individuals with Disabilities Act mandates access to a wide range of educationally related services for students with disabilities, including counseling. For the school counselors to provide competent counseling interventions to students with disabilities, they must first develop an awareness for the cognitive, affective, and social problems of these students (Bowen & Glenn, 1998). Generally speaking, within the entire population of students with disabilities, school counselors will likely provide the majority of their services to students with mild disabilities. Typically, this includes students with learning disabilities, other health impairments (e.g., attention deficit disorder), mild mental retardation, and emotional and behavioral disorders.

As discussed earlier, school counselors often receive little training specifically related to counseling students with disabilities, and there are few resources discussing best practices for school counselors when working with students with disabilities; however, many counselors possess the skills needed to work with these students and their families. Communication skills, empathy, conflict skills, and facilitation skills are essential. As evidenced by the vast array of functional impairments included in the diagnostic definitions of the 13 categories of disabilities eligible for special education and related services (see Appendix A), students with dis-

abilities do not represent a homogeneous group, and there is no "one size fits all" counseling approach or intervention. Counselors who are willing to explore work with students and/or family to examine the specific student's functional strengths and weaknesses, while putting aside feelings of low expectations, pity, and biases can be very effective with this population (Tarver-Behring & Spagna, 2004).

Referring again to the evidenced-based theories of psychosocial adaptation to disability, self-determination, and career self-efficacy, school counselors will find a multitude of possible "jumping off points" for individual and small group counseling. For instance, we know that self-definition and self-understanding are critical to incorporating the diagnostic label into the student's past experiences, current self-concept, and future goals. Milson and Hartley (2005) discussed the importance of the school counselor to college bound students with learning disabilities, including the provision of counseling related services designed to assist the student to "explore the relationship between their skills and abilities and potential future careers" (p. 438). Elementary school counselors are also critical to meeting the educational and personal/social needs of students with disabilities. Bergin and Bergin (2001) suggested that elementary school counselors should be keenly aware of how language-based problems can impede the counseling process for some students with learning disabilities. School counselors should be knowledgeable of the functional limitations of the student with a learning disability, prior to engaging in counseling interventions. For example, a student with an auditory processing disorder may not benefit from cognitive therapy as much as play therapy.

Finally, consider a sixth-grade girl who was recently evaluated for a specific learning disability and is subsequently found eligible for special education. This student may need assistance reflecting on her past academic performance, her current academic needs, and her future career goals. She may need to be gently guided to take responsibility for ensuring that her teachers provide the accommodations she needs without externalizing blame when a teacher's instructional style clashes with her learning style. She may feel stigmatized by the label of L.D. and may feel embarrassed to be receiving special education services. The school counselor is in an ideal position to assist this girl with understanding herself and her learning needs and, by doing so, is building a solid foundation for both self-determination and career self-efficacy in adolescence and adulthood.

Individual and Group Counseling for Specific Problems or Issues

Social skills training. Social skills are often pointed to by educators as a key deficit area for many children, especially children and adolescents with disabilities (Swanson & Malone, 1992). Social skills training (SST) programs are based on behavioral therapy and have gained prominence for their hope of remediating social competence deficits in students, especially for students with specific learning disabilities, mental retardation, emotional disturbance, or attention deficit/hyperactivity disorder (Gresham, Sugai, & Horner, 2001). Gresham (1998, as cited in Gresham et al., 2001) noted that "SST has four primary objectives: (a) promoting skill acquisition; (b) enhancing skill performance; (c) removing competing problem behaviors; and (d) facilitating generalization and maintenance" (p. 338).

While many SST packages and curricula are available for purchase (see also, Greenberg, Kusché, & Mihalic, 1998; Hoffman, 2003; Katz, McClellan, Fuller, & Walz, 1995), school counselors should be knowledgeable about the type of social skills deficit that requires remediation, as well as the research on SST outcomes. Many training curricula may not take into account what skills the student already possesses and in what settings the student may need more practice and support. For example, it is not appropriate to pull a student out of class to teach a skill he or she already knows, when what he or she really needs is practice "in the moment." The most positive results have been found in studies that match the social skills deficits with the SST intervention strategy (Gresham et al., 2001). School counselors must work closely with classroom teachers and special educators to first assess the exact nature of the social skill deficit and then design an intervention strategy, avoiding a "cookie cutter" approach at all times. For example, comic book conversations are a positive behavioral support strategy that has been used successfully with students with autism, mild/moderate learning disabilities, and cognitive and behavioral disabilities (Gray, 1994; Pierson & Glaeser, 2005).

The final issue school counselors must be aware of is the lack of broad generalization and maintenance of many SST programs. In other words, many students are not able to transfer the skills they learn in SST into the real world, suggesting that pullout small group settings may not be the most effective way to deliver SST. As much as possible, school counselors should consult with teachers and educational assistants to work within the regular classroom or other real-world settings to capitalize on "teachable moments" as this kind of contextual approach has the greatest efficacy (Gresham et al., 2001).

Self-determination guidance. There are two primary approaches to teaching self-determination to students with disabilities in schools today: (a) specific guidance curriculum and (b) whole school imbedded practices. Generally, the curricular approaches are led by special educators; however, special educators can benefit from the expertise of the

school counselor, who can provide additional resources and insight to enhance the delivery of the curriculum.

The broader approach of incorporating activities that enhance self-determination into larger school practices (e.g., general education curriculum, special education curriculum, extracurricular activities, or community based activities) lends itself easily to current models of comprehensive school counseling programs, which also seek to imbed specific social and emotional development goals into a variety of school services. To date, self-determination has not been a purposeful component of developmental comprehensive counseling and guidance programs or the ASCA's National Model (2003). Because elements of self-determination encompass such constructs as decision making and self-efficacy, however, components exist that could be readily expanded.

Field and Hoffman (2002) have developed a list of nine quality indicators for promoting self-determination in educational settings (see Table 12.2), which are based on an extensive review of the existing self-determination literature, qualitative interviews, and expert review. Since the indicators were developed to enhance the self-determination of the entire school community (i.e., students, parents, faculty, leadership, and staff), they naturally lend themselves to a comprehensive counseling and guidance program. Examples of these practices in schools are (a) the systematic infusion of self-determination across the curriculum, (b) parent and student involvement in individualized educational planning meetings, (c) students selecting their own courses, (d) encouraging families to support new strategies at home to reinforce classroom learning, (e) team projects that bolster relationship building between students, (f) the use of assistive technology to provide for individual needs and supports, (g) the encouragement and support of divergent opinions within the school community, (h) clear behavioral management expectations for students, and (i) the active involvement of the entire school community in school evaluation and school improvement activities. By developing these quality indicators, school counselors can support school teams and programs in an effort to help students develop self-determination within school environments.

School counselors who develop a self-determination focus in their comprehensive counseling and guidance programs should also focus on assisting students with disabilities to develop a lasting relationship with an adult. Research has shown that students who have a confiding relationship with an adult have more opportunities for self-determination development (Benz, Lindstrom, & Yovanoff, 2000). While it is unrealistic to expect school counselors to have close relationships with all students with disabilities, it is feasible that the school counselor can coordinate mentoring programs in addition to maintaining individual relationships with students with disabilities.

Building on research documenting positive relationships between student-centered planning practices and student self-determination, Benz et al. (2000) discovered that "what adolescents with disabilities appear to want, *and what many adolescents desperately need*, is a personal relationship with a trusted adult who will be available to encourage their efforts, validate their fears, and celebrate their accomplishments" (p. 525). According to self-determination theory, in order to be truly self-determined, students must learn not only to make decisions, but also to self-evaluate decisions and experiences (Wehmeyer, Sands, Doll, & Palmer, 1997). Developmentally speaking, this is a difficult task for all children and adolescents and can be directly enhanced through didactic exchanges that occur in relationships built upon mutual trust and respect. It is critical to the long-term success of this population that adolescents with disabilities have access to a trusted adult after high school graduation. It is during these early adulthood years that real-world learning is occurring; this period of development offers many opportunities for hands-on learning about oneself, along with opportunities for failure, which can then lead to personal growth. Without the ability to converse and reflect with a trusted adult, many young people with disabilities do not experience an adequate quality of life in adulthood.

Table 12.2 Self-Determination in School Environments (Field & Hoffman, 2002, pp. 114–117).

Quality Indicators of School Environments That Promote the Acquisition of Knowledge, Skills, and Beliefs Related to Self-Determination
Quality Indicator 1: Knowledge, skills, and attitudes for self-determination are addressed in the curriculum, in family support programs, and in staff development.
Quality Indicator 2: Students, parents, and staff are involved participants in individualized educational decision making and planning.
Quality Indicator 3: Students, families, faculty, and staff are provided with opportunities for choice.
Quality Indicator 4: Students, families, faculty, and staff are encouraged to take appropriate tasks.
Quality Indicator 5: Supportive relationships are encouraged.
Quality Indicator 6: Accommodations and supports for individual needs are provided.
Quality Indicator 7: Students, families, and staff have the opportunity to express themselves and be understood.
Quality Indicator 8: Consequences for actions are predictable.
Quality Indicator 9: Self-determination is modeled throughout the school environment.

Self-esteem enhancement. When a student is diagnosed with a disability, he or she also becomes labeled and categorized, and many students report feeling stigmatized by their special education status (Smart, 2001). Depending on the disability and the perception by others about the disability, the student may encounter varying degrees of insult to his or her self-image and self-concept. For example, a student with a specific learning disability may be perceived as mentally retarded because he or she is a slow reader, while a student with schizophrenia may be perceived as potentially violent. We know that the most successful adults with disabilities are those who are self-determined and, therefore, possess a strong sense of self-awareness. Because of these factors, self-esteem is foundational to accepting one's self, including one's strengths and weaknesses; therefore, self-esteem enhancing services are an important aspect of the school counselor's role in working with students with disabilities.

Whiston and Sexton (1998) evaluated school counseling outcome research according to Gysbers and Hendersons (1994) comprehensive developmental guidance model as a theoretical framework. Many studies were included as examples of responsive services that had self-esteem as the measurable outcome, with a few of the studies including students with disabilities as the targeted population. Of these studies, group counseling was the most popular method of service delivery across all grade levels. Because of the varying nature of the interventions, an overall analysis of the effectiveness of the multiple types of self-esteem interventions was not provided; however, school counselors can evaluate the efficacy of their own interventions through the use of pre- and posttests or by utilizing an evidence-based curriculum readily available.

Brief Family Interventions

When counseling students with disabilities and their families, the most effective model is "a broad-based service model in which the counselor creates a collaborative community with all individuals and resources necessary for the child or adolescent to experience success in every area of life to the greatest extent possible" (Tarver-Behring & Spagna, 2004, p. 220). Collaborative relationships between families and professionals who work with students with disabilities are optimal given the familial investment in the outcome of children with disabilities, as well as the association between parent involvement in both student and school performance. Furthermore, parents' knowledge of their children and of their own expectations helps guide educators in the selection of appropriate interventions (Blackbourn, Patton, & Trainor, 2004).

Simeonsson and Bailey (1990) have developed a framework that represents the full spectrum of professional involvement in the area of early intervention and the services provided for young children with special needs. This useful organizing framework can be applied to services provided to the families of school-aged students with disabilities. Using a numbering system that reflects a successive increase in the active involvement of the practitioner, Simeonsson and Bailey proposed the following professional functions: (0) informing families about available services and offering such services, (I) tracking and advising families, (II) providing or brokering child-related services, (III) consulting or teaching families as part of information sharing, (IV) working on practical concerns in the role of family advocate and focusing on personal concerns through relationship building, (V) setting goals to develop practical strategies and coordinating resources to help the family manage their ongoing needs and demands, and (VI) providing help with psychological or existential issues through counseling or therapy.

School counselors who effectively work with families of children with disabilities remember that parents' roles vary with the professional's role due in part to parents' comfort with parent–professional interaction and involvement in counseling services. When the practitioner's function is to provide information or to track and advise families, family involvement is modest. At the middle of the spectrum, when professionals take on the role of consultant or provide other guidance for families, families actively seek both information and skills. For example, parent education requires a commitment of time and a willingness to learn of the part of the parent. At the highest levels of Simeonsson and Bailey's (1990) framework, parents pursue counseling and thus invest much of themselves in personal, behavioral and psychological terms.

Rather than recognize and respect variations in involvement, practitioners may criticize parents who refrain from participation. On one hand, nonuse of services and limited involvement may signal extreme sensitivity, apathy, or resistance on the part of parents. In these cases, school counselors can employ strategies such as setting a positive tone, using active listening skills, or using written or verbal contracts to clarify expectations (Campbell, 1993). On the other hand, low parent involvement may reflect other issues. Realistically, parents may feel distracted or overwhelmed by financial, health, or job-related issues. Perhaps they value their privacy and will not disclose family concerns until their counselor earns their trust (Campbell, 1993). In most cases, there is no one best way for parents to be involved at any point in time. Ideally, a full range of services should be available to meet parents' current and evolving needs and desires for involvement (Fine & Gardner, 1991; Weissberg, Caplan, & Harwood, 1991).

Harry (1997) has used the concepts of leaning forward and bending over backwards to suggest guidelines

for working with families, especially when there are viewpoint differences between parents and professionals. She commented,

> If I feel like I'm bending over backwards in working with families, then I'm probably doing something wrong! Not only am I doing something unnatural, but, by bending backwards, I'm actually looking away from the person I'm trying to help. (p. 62)

In order to build bridges between the counselors' and parents' points of view through a posture of reciprocity, a school counselor can undertake the following specific actions: (a) identify issues that divide the professional and the family with whom the professional is working, (b) identify beliefs or values that underlie the professional's position, (c) inquire into the beliefs and values that underlie the family's position, (d) explicitly discuss the two different but equally valuable points of view, and (e) identify a point of similarity between the professional's and the family's views as a first step in the process of collaboration (Harry, 1997). Certainly, building bridges is well worth the effort if, as a result, counselors can more effectively collaborate with and enhance the well-being and development of young children with disabilities.

Consultation Services With Teachers and Multidisciplinary Teams

Whether at a meeting operating under IDEA or Section 504, the school counselor must be a supportive member of the multidisciplinary team that uses a group decision-making process and works toward the goal of enabling a student with a disability to learn and succeed (Lockhart, 2003). Lockhart listed possible professional school counselor functions on a multidisciplinary committee, including (a) serving as a member of a multidisciplinary meeting, (b) chairing a multidisciplinary meeting, (c) participating in the development of an individualized education plan, (d) participating in the development of a transitional plan, (e) participating in the development of an individual treatment plan, (e) participating in the development of a Section 504 plan, and (f) participating in the planning for related services. Notably, school counselors have much to offer multidisciplinary teams. The previous discussion of services for students of disabilities and their families identified some ways to integrate school counselors' knowledge of psychosocial adaptation to disability, self-determination, and career self-efficacy into their work with students with disabilities and their families and, in the process, into their consultation with teachers. Often, the counselor is very familiar with the parents, the child, and the child's needs. Moreover, the school counselor can readily make sense of the larger issues. The counselor also has the expertise to foster a sense of trust as well as open communication (Greer, Greer, & Woody, 1995). The specific nature of the consultation will vary with the needs of a students and the nature of the disability.

Ethical, Legal, and Professional Issues

When providing services to students with disabilities, school counselors must be cognizant of the multitude of ethical, legal, and professional issue surrounding their practice. In 1999, the ASCA adopted an official position statement regarding the role of the school counselor and students with disabilities (this position statement was subsequently revised in 2004). Specifically, ASCA (2004) stated that,

> Professional school counselors encourage and support all students' academic, personal/social and career development through comprehensive school counseling programs. Professional school counselors are committed to helping all students realize their potential and make adequate yearly progress despite challenges that may result from identified disabilities and other special needs. (¶ 1)

The ASCA has also stated that the school counselor's role in working with students with disabilities must be clearly defined and understood by all parties. It is not the sole responsibility of the school counselor to make special education or 504 plan eligibility decisions or to prepare the individual education plan or 504 plans. The school counselor is, however, in a unique role to support and advocate for services for students with disabilities. Common interventions for school counselors include, but are not limited to (a) participating in multidisciplinary teams; (b) collaborating with teachers and other education staff to support individualized instruction; (c) providing social skills training; (d) conducting self-esteem enhancing counseling and guidance activities; (e) assisting with the establishment, implementation, and maintenance of behavior management plans; (f) providing career development and guidance activities, especially related to the transition from high school to adult life; (g) counseling parents and families; and (h) making outside referrals to a variety of community providers and resources (ASCA, 2004). Others have written that school counselors have an obligation to (a) assist other educators to identify students who might have disabilities, (b) assist with appropriate evaluation and testing to determine if students do have disabilities (provided it is not beyond the scope of the school counselor's training or expertise), (c) assist in monitoring the student's edu-

cational progress, and (d) help families understand their children's disabilities (Remley, Hermann, & Huey, 2003).

Special education and 504 eligibility criteria. The legal issues surrounding eligibility for special education (IDEA, P.L. 105-107) and section 504 services (i.e., Rehabilitation Act of 1973) are beyond the scope of this chapter; however, a broad overview will be provided with the caveat that school counselors must pursue further research prior to implementing the laws in educational settings. Figure 12.1 provides a flow chart illustrating the decision-making points and criteria educators must consider when making eligibility decisions.

While the ASCA maintains that school counselors must not be the sole decision makers of special education or section 504 eligibility decisions, many school counselors today are "unofficially" reporting that they are responsible for determining eligibility as well as for establishing and then maintaining 504 plans. As referenced earlier, Section 504 of the Rehabilitation Act has been a federal law since 1973 (including the provision that students with disabilities receive a free and appropriate education [FAPE]); however within the last 15 years, the Office of Civil Rights has become proactive in advocating for the education of students with disabilities (Council of Administrators of Special Education [CASE], 1999). Also, the Americans with Disabilities Act is being interpreted by the Office of Civil Rights as incorporating all Section 504 protections (CASE).

Both IDEA and Section 504 protect the right of students with disabilities to FAPE; however, a student who is eligible for 504 services may be ineligible for IDEA special education services. Recall again that IDEA defines *eligible* as (a) only those students whose disability qualifies as one of the 13 specific diagnostic categories, and (b) those who are also in need of specialized instruction due to their impairment. Section 504 is far more inclusive in its definition, protecting all students with disabilities that substantially limit one or more life activities (including education). Once the school determines that a student, because of a disability, requires either special accommodations or related services to participate in his or her regular classroom, eligibility for Section 504 accommodations must occur (Heyward, 1992). Following the evaluation, if the student is found eligible, a 504 plan must be secured and implemented.

Examples of potential 504 disability conditions not typically covered under IDEA include, but are not limited to, (a) medical conditions such as asthma, allergies, diabetes, or cancer; (b) attention deficit disorder (ADD); (c) communicable diseases such as HIV; (d) temporary medical conditions; (e) drug/alcohol addiction, or (f) behavioral difficulties (CASE, 1999). A student with a health impairment that does not directly impact learning, but still needs accommodations or assistance during the school day, would require an evaluation for 504 services. For example, if a second-grade student with attention deficit disorder needs a regular break during the day to receive medication, but has no other educational needs related to the ADD diagnosis, the school may establish a 504 plan, rather than an individualized education plan (IEP), to assure that this student has the necessary accommodations.

Representation within special education. Disability can and should be understood within the context of multicultural counseling, as the dynamic of dominant culture (i.e., nondisabled) versus the nondominant culture (i.e., disabled) is similar in nature to other cultural phenomenon. As evidenced by the simple statistics of characteristics of special education students, the variables of ethnicity and gender appear to bias the identification of students with disabilities. The reauthorization of IDEA in 2004 specifically calls for schools to begin addressing these issues as well.

Wehmeyer and Schwartz (2001b) have provided a review of the literature regarding gender bias in referral and admission to special education services, noting that the issue has been a focus of research for the past two decades. The authors have also noted that federal reports have consistently found twice as many males as females within the special education ranks. Some studies have accounted for this through biology and behavior, but many more have found that male overrepresentation may be a function of bias. An additional problem that may be created by such bias is female underrepresentation in special education. Wehmeyer and Schwartz (2001a) hypothesized that girls who need some academic support but who do not display behavior problems are neither being referred nor receiving services. Wehmeyer and Schwartz (2001b) noted that "referral bias is the degree to which persons responsible for referring students for evaluation of eligibility in special education . . . make such referrals based upon personal or professional opinions rather than objective indicators" (p. 274). School counselors must be aware of this bias and self-monitor their own referral practices accordingly.

In another comprehensive review of the literature, Coutinho and Oswald (2000) evaluated the disproportionality of representation in special education services. Studies have consistently found African American students to be overrepresented in every disability category, especially in the mental retardation and emotional disturbance categories. Meanwhile, Hispanic students today (U.S. Department of Education, 2002) are overrepresented in the learning disability category and underrepresented in the categories of mental retardation, emotional disturbance, and other health impairments (see Table 12.1). The numbers of American Indian/Alaska Native students

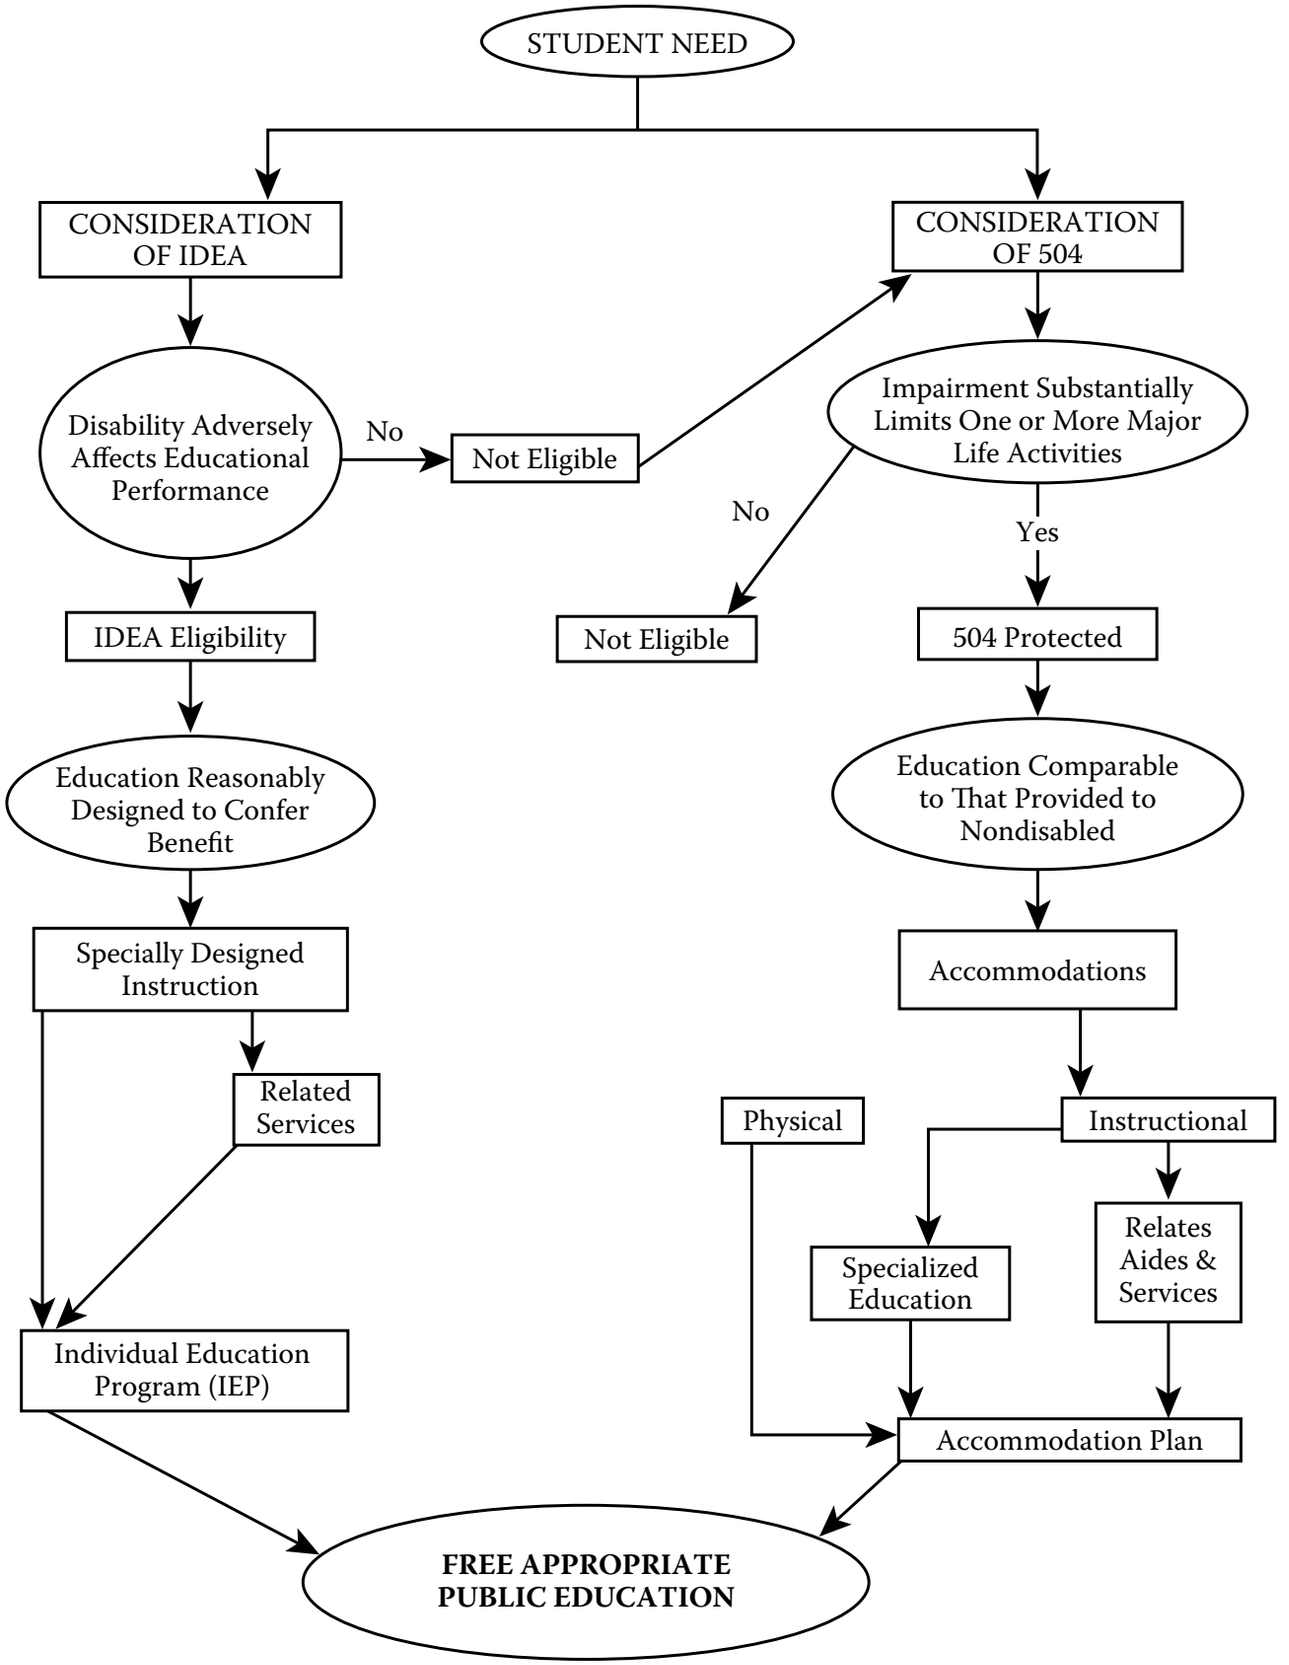

Figure 12.1 IDEA/504 Flow Chart. From *Section 504 and the ADA Promoting Student Access: A Resource Guide for Educators by Council of administrators of Special Education*, 1999, For Valley, GA: Author, p 5.

receiving services for specific learning disabilities were higher than that for all students with disabilities, and the percentage receiving services for mental retardation was lower. While there has been some variance in the past 25 years—the time when this issue began to gain prominence—these issues of disproportionality have remained largely unchanged. Concomitantly, underidentification of students from diverse backgrounds for gifted and talented programs is also an issue. There are few ethnic minority students in gifted and talented programs due to assessment instruments (e.g., those with a language bias), the reputation of sending schools that are not well regarded, and teacher training that does not emphasize the identification of student strengths (Boscardin, Brown-Chidsey, & Gonzalez-Martinez, 2003; Ford, 1998).

These statistics are important to school counselors because they describe the context of services to students with disabilities in schools today. If counselors are to become advocates for the needs of students with disabilities, they must first be aware of their own biases and the biases of other educators. How can this be accomplished by school counselors and other school personnel? Existing scientific evidence on stereotyping and cognitive automaticity indicates that biased perceptions often originate in processes that take place outside of conscious awareness (Abreu, 2001). Complicating the issue is the fact that stereotypes filter social reality. Citing Eagly and Kite (1987) Abreu explained, "in Western culture, male sex, White race, nondisabled physical status, heterosexual orientation, and young age are treated as cultural expectations, assumed to characterize a person if no dimension-relevant information is explicitly provided" (p. 495). With the objective of making covert attitudes and beliefs easier to acknowledge, Abreu provided a helpful review of theory and research on these perceptual processes and recommended sources of additional information on the topic for both multicultural counseling trainers and students on the topics.

Abreu (2001) discussed a variety of experiential educational experiences that are designed to promote self-awareness of prejudicial biases and stereotypes. These include the labeling exercise (Goldstein, 1997), which can be used with a group to illustrate the impact of stereotypes on perceivers, as well as the Implicit Association Test (Greenwald, Banaji, Noskek, & Baskhar, 1998; Greenwald, McGhee, & Schwartz, 1998), which can be accessed on the Internet and used by individuals to detect unconscious prejudice. In addition, counselors can promote equitable education for culturally diverse students with disabilities by becoming more knowledgeable about culturally and linguistically appropriate educational practices, facilitating culturally fair assessment, using culturally sensitive and inclusive school-based programs that support the academic and social success for all students, and quickly responding when academic risk factors first become evident (Tarver-Behring & Spagna, 2004).

While Abreu (2001) focused on racial biases, Rousso and Wehmeyer (2001) provided an extensive discussion of what educators should know about gender equitable education for male and female students who qualify for and would benefit from special education services. As previously mentioned, school counselors can help monitor that evaluative methods are free of gender bias and stereotyping. Additional guidelines of relevance to school counselors include creating a learning environment that encourages participation of all members, minimizes gender-segregated activities, uses diverse strategies given different learning strengths, encourages cooperation, and provides praise and recognition in an equitable manner. In sum, it is imperative that school counselors attend to racism, sexism, and other factors in the ecological context of a student's world and strive to address these critical elements within the role of a school counselor (Bemak & Chung, 2005).

Future Directions

Synthesis: Theories, Research, and Implications for School Counselors

As the field of school counseling has moved from a largely reactionary position to a proactive one of designing, implementing, and evaluating comprehensive school counseling programs, the school counselor's role with students with disabilities has been somewhat neglected. We know that school counselors often serve students with disabilities, especially students with learning disabilities and behavioral disorders. It appears that the role of the school counselor, in supporting students with disabilities, is probably as varied as the students with disabilities themselves. Allowing motivated school counselors a myriad of opportunities to tap into individual interests and strengths would improve their practice with students with disabilities; however, there does not appear to be any large-scale, focused movement within the field to advance theory, research, and practice with this population.

In this chapter, we have reviewed three important theories—(a) adjustment to disability, (b) self-determination, and (c) Social Cognitive Career Theory (SCCT)—all of which are excellent starting points for expanding one's knowledge about the experience of students with disabilities and their families. We have also reviewed examples of interpersonal counseling, group counseling, and classroom guidance activities that may be useful for enhancing the academic success of students with disabilities. In each of these areas, school counselors must learn to be advocates for students with dis-

abilities and their families. The school counselor may be the one educational staff member who is knowledgeable about the psychosocial, as well as educational, aspects of the disability. Consequently, the school counselor may also be the only educational staff member who possesses the interpersonal counseling skills to assist all parties to negotiate a successful educational experience for the student.

Recommendations for Research

Counseling and consultation. As in all areas of school counseling practice, school counselors must collect evidence about the interventions they provide to evaluate their efficacy as well as promote their role within their schools. Since there is little research on school counseling practice and students with disabilities, recommendations for future research are very broad.

Based on the theories reviewed in this chapter, studies that address interventions that increase self-knowledge, self-esteem, self-efficacy, or self-determination in students with disabilities are critical. Special educators should not be expected to provide these interventions alone, and since we know that students with disabilities who possess self-knowledge, self-esteem, and self-determination have better adult outcomes, school counselors need to become active players in delivering these services and programs.

Furthermore, Benz et al. (2000) contended that while the standard-based school reform efforts of the past decade include many crucial benefits for special education students, "the achievement of academic skills alone is insufficient for improving post-school outcomes in continuing education, employment, and independent living" (p. 526). In addition to academic skills, students with disabilities must also have knowledge and skills in key transition content areas (e.g., independent living, careers, personal/social arenas), awareness of their own interests and abilities in order to match those to job opportunities, and the skills necessary to pursue vocational postsecondary educational and training goals.

Finally, given the current climate of educational reform and high-stakes assessment, the demand for school counselors to become experts at enhancing individual student's academic capabilities is ever increasing. Students with disabilities face especially difficult odds of passing classes—not to mention high-stakes exams—depending on the nature of their impairment. In the last 15 years, little has been written in the school counseling literature about the efficacy of study skills or specific academic interventions, making this an area appropriate for future research.

School counselor preparation. Whether addressed in stand-alone courses or integrated into core counseling courses, the following topics are important to cover in school counselor preparation: disability legislation, general characteristics, common cognitive issues, psychosocial issues, individualized education programs, effective counseling interventions, and transition planning (Milsom & Akos, 2003). One goal for school counseling educators would be to move beyond general knowledge of various disabilities and competence in dealing with students with disabilities and their parents and toward more familiarity with relevant legislation and the role of school counselors in implementing legislation (Wood Dunn & Baker, 2002). In addition, we concur with Milsom and Akos' observation that, "In a field that values practical experience, it seems that required, practical experiences with students with disabilities should merit more importance than school counselor education programs currently support" (p. 93). Both school counselors in training and professional school counselors can also obtain relevant knowledge through counseling workshops, consultation, supervision, current therapeutic literature, and community resources (Tarver-Behring & Spagna, 2004).

School counselor competencies. Just as other counseling specialties (e.g., counseling psychology and rehabilitation counseling) have developed essential components for multicultural counseling competence (e.g., Middleton et al., 2000; Sue, Arredondo, & McDavis, 1992), we propose that school counseling explore and develop the essential components of school counselor competence. We would expect that school counselor competencies would encapsulates the culturally relevant and effective intervention strategies for working with underrepresented student populations including students with disabilities.

Subsequent to the seminal work of the other counseling specialties, it would be essential for school counselors to consider the domains of beliefs and attitudes, knowledge, and skills. The following are examples of the types of considerations regarding students with disabilities that should be considered when developing the school counselor competencies. School counselors must assess their own beliefs and attitudes about the experience of disability, especially their "tendencies toward overidentification or paternalistic attitudes and the impact of these on" students with disabilities (Middleton et al., 2000, p. 226). In terms of knowledge, school counselors would need to be knowledgeable about not only diagnostic criteria, but also the psychosocial, and sociopolitical ramifications of the various types of disabilities. Furthermore, school counselors must be aware of how their own biases about specific disabilities may impact their practice (e.g., efforts to identify strengths, advocate for services, access to community resources). Lastly, we have identified a variety of specific counseling and advocacy related skills that effective school counselors should possess when working with students with

disabilities. School counselors must continue to employ evidenced based interventions with all populations, especially those from underrepresented populations.

Appendix A. Federal Definitions of Disabilities Qualifying for Special Education and Related Services (IDEA 1997, 20 U.S.C. 1401(3)(A) and (B); 1401(26)) (NICHC), 2002).

Federal Definitions of Disabilities Qualifying for Special Education and Related Services

Specific Learning Disability

- General. The term means a disorder in one or more of the basic psychological processes involved in understanding or in using language, spoken or written, that may manifest itself in an imperfect ability to listen, think, speak, read, write, spell, or to do mathematical calculations, including conditions such as perceptual disabilities, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia.
- Disorders not included. The term does not include learning problems that are primarily the result of visual, hearing, or motor disabilities, of mental retardation, of emotional disturbance, or of environmental, cultural, or economic disadvantage.

Speech or Language Impairment

- A communication disorder, such as stuttering, impaired articulation, a language impairment, or a voice impairment, that adversely affects a child's educational performance

Mental Retardation

- Significantly subaverage general intellectual functioning, existing concurrently with deficits in adaptive behavior and manifested during the developmental period, that adversely affects a child's educational performance.

Emotional Disturbance

- The term means a condition exhibiting one or more of the following characteristics over a long period of time and to a marked degree that adversely affects a child's educational performance:
  - an inability to learn that cannot be explained by intellectual, sensory, or health factors.
  - an inability to build or maintain satisfactory interpersonal relationships with peers and teachers.
  - inappropriate types of behavior or feelings under normal circumstances.
  - a general pervasive mood of unhappiness or depression.
  - a tendency to develop physical symptoms or fears associated with personal or school problems.
- The term includes schizophrenia. The term does not apply to children who are socially maladjusted, unless it is determined that they have an emotional disturbance.

Multiple Disabilities

- Concomitant impairments (such as mental retardation-blindness, mental retardation-orthopedic impairment, etc.), the combination of which causes such severe educational needs that they cannot be accommodated in special education programs solely for one of the impairments. The term does not include deaf-blindness.

Hearing Impairment

- An impairment in hearing, whether permanent or fluctuating, that adversely affects a child's educational performance but that is not included under the definition of deafness.

Deafness

- A hearing impairment that is so severe that the child is impaired in processing linguistic information through hearing, with or without amplification, that adversely affects a child's educational performance.

Orthopedic Impairment

- A severe orthopedic impairment that adversely affects a child's educational performance. The term includes impairments caused by congenital anomaly (e.g., clubfoot, absence of some member, etc.), impairments caused by disease (e.g., poliomyelitis, bone tuberculosis, etc.), and impairments from other causes (e.g., cerebral palsy, amputations, and fractures or burns that cause contractures).

Other Health Impairment

- Having limited strength, vitality or alertness, including a heightened alertness to environmental stimuli, that results in limited alertness with respect to the educational environment, that is:
  - due to chronic or acute health problems such as asthma, attention deficit disorder or attention deficit hyperactivity disorder, diabetes, epilepsy, a heart condition, hemophilia, lead poisoning, leukemia, nephritis, rheumatic fever, and sickle cell anemia; and
  - adversely affects a child's educational performance

Visual impairment

- Including blindness means an impairment in vision that, even with correction, adversely affects a child's educational performance. The term includes both partial sight and blindness.

Autism

- A developmental disability significantly affecting verbal and nonverbal communication and social interaction, generally evident before age 3, that adversely affects a child's educational performance. Other characteristics often associated with autism are engagement in repetitive activities and stereotyped movements, resistance to environmental change or change in daily routines, and unusual responses to sensory experiences. The term does not apply if a child's educational performance is adversely affected primarily because the child has an emotional disturbance.
- A child who manifests the characteristics of "autism" after age 3 could be diagnosed as having "autism" if the criteria in paragraph (c)(1)(i) of this section are satisfied.

Deaf–Blindness

- Concomitant hearing and visual impairments, the combination of which causes such severe communication and other developmental and educational needs that they cannot be accommodated in special education programs solely for children with deafness or children with blindness.

Traumatic Brain Injury

- An acquired injury to the brain caused by an external physical force, resulting in total or partial functional disability or psychosocial impairment, or both, that adversely affects a child's educational performance.
- The term applies to open or closed head injuries resulting in impairments in one or more areas, such as cognition; language; memory; attention; reasoning; abstract thinking; judgment; problem-solving; sensory, perceptual, and motor abilities; psychosocial behavior; physical functions; information processing; and speech.
- The term does not apply to brain injuries that are congenital or degenerative, or to brain injuries induced by birth trauma.

XIII
RACE AND ETHNICITY IN SCHOOL COUNSELING

MARIE L. MIVILLE
Teachers College, Columbia University

> Let there be no misunderstanding about this, no easy going recognition. We are not going to share modern civilization just by deserving recognition. We are going to force ourselves in by organized far-seeing effort—by outthinking and outflanking the owners of the world today . . . if we think and learn and do.
>
> **(W. E. B. Dubois, 1930, cited in Butchart, 1988, p. 333)**

Educators recently celebrated the 50th anniversary of the *Brown vs. Board of Education* decision mandating desegregation of public schools in the United States and opening access to educational resources for children and youth of color. Yet today, students of color, particularly those who are African American, Latina/o, and American Indian, continue to lag far behind White students on many educational milestones. For example, the overall graduation rate of all high school students in the United States is approximately 75%, but hovers around 50% for these three racial/ethnic groups (Orfield, Losen, Wald, & Swanson, 2004). Indeed, as one author noted, the graduation rates of many students of color have "the same odds as flipping a coin" (Swanson, 2004, p. 1). Moreover, recent statistics indicate that most students of color are attending schools that (a) are increasingly segregated, (b) are located in urban settings, (c) often lack basic materials, such as updated books and clean facilities, and (d) utilize rote forms of learning not found in other school settings (Kozol, 2005). In short, the United States is at risk of losing half of its minority youth from the educational pipeline.

Although highly challenging, the roles school counselors can play in helping to mitigate the crisis of educational equity are multilayered, long-term, and potentially effective. At a minimum, school counselors must recognize the impact that the societal forces of racism and ethnocentrism have on school systems serving children and adolescents of color. As D. W. Sue (2003) noted,

> It is probably fair to say that our school systems have done a poor job in educating our students to understand issues of diversity, cultural differences, bias, and prejudice because the curriculum and services are monocultural and ethnocentric in nature. (Pedersen & Carey, 2003, p. ix)

Thus, school counselors must be prepared for the urgent social realities present in their schools that will affect the efficacy of any interventions they may attempt with racially and ethnically diverse students.

In this chapter, I will provide a brief overview of some of the significant historical events and issues relevant to race and ethnicity in school settings, particularly for school counseling. I also will review theory, research, and practice initiatives centered on race and ethnicity issues for school counseling. Despite the dire state of education for many students of color, I will emphasize primarily successful approaches that school counselors might adopt, rather than ineffective ones (Garcia, 2001). Success stories about individuals, programs, and school settings will be described throughout the chapter in the hope of providing guidance as to how school counselors might be able to conceptualize, intervene, and evaluate the effectiveness of their work with students of color and others, such as families, teachers, and school administrators.

Although the terms *race* and *ethnicity* are often used interchangeably, they refer to distinct constructs. The term *race* refers to a social construct used to identify individuals based on their presumed biological makeup (e.g., Caucasian,

Asian; Helms, 1990). Visible physical characteristics commonly used to identify racial group membership include skin color, hair type and color, eye color, head shape and size, and facial features. Although the construct of race has been debunked regarding its genetic bases (Zuckerman, 1990), the term nevertheless refers to a form of demographic categorization that continues to profoundly affect many levels of society, including social policies, educational interventions, and psychological functioning, in powerful yet sometimes invisible ways. The term *ethnicity* has been defined very broadly to include physical characteristics: "groups defined by descent, real or mythical, and sharing a common history and experience" (Glazer, 1971, p. 447). In this chapter, however, I use a more narrow definition: "a group classification of individuals who share a unique social and cultural heritage (customs, language, religion, and so on) passed on from generation to generation" (Casas, 1984, as cited in Helms, 1990, p. 4). Examples of ethnic group membership include Mexican, Ethiopian, and French.

There are often strong interactions between race and ethnicity, such that the impact of oppression arising from racism and ethnocentrism may be commingled. My chapter will examine the unique impact of race and ethnicity as well as their nexus for students of color traditionally underrepresented in, or as some might argue "pushed out" of, school systems, including African Americans, Latinas/os, American Indians, and newly immigrated students (Swanson, 2004).

History of Race and Ethnicity Issues in Schools and School Counseling

As noted at the beginning of the chapter, the inclusion of students in school systems from diverse racial and ethnic backgrounds is relatively recent. Generations of legal and educational scholars fought for this right to educational access for people of color. Butchart (1988) described the importance of this process of inclusion:

> W. E. B. DuBois once argued that the proper education for oppressed groups such as African Americans had a special, critical purpose. He knew, as have all serious educators since Socrates accepted his cup, that education was always and everywhere political. For the oppressed, the political role of schooling had to be aimed precisely at finding the means to end the oppression. (p. 333)

Butchart further noted that the purpose of knowing history is to "provide a guide to action." Telling stories of what came before helps create a better understanding of the stories of today.

The end of the Civil War in the 1860s and the freedmen's educational movement led to free public schooling in the South, but at the same time, a focus on "industrial education" rather than progressive or liberal education for many Black school children (Butchart, 1988). Throughout the 19th century and well into the 20th century, state laws existed that systematically excluded or separated children and adolescents of African American, Latina/o (particularly Mexican), and American Indian heritage from mainstream schools. Not only were these students segregated, school systems who served these children often were hostile to their cultural values, customs, and native languages. Lomawaima (1994) poignantly described the experiences of American Indian children who attended an Oklahoma boarding school created to assimilate students into the mainstream. While the reported experiences of these youth were demoralizing and harmful, many students learned to bond together and develop an American Indian identity as well as reinforce their tribal affiliations. Del Castillo (cited in San Miguel, 1986) argued that the educational experiences of many Chicana/o students in the late 1800s and early 1900s were so negative that these students felt encouraged to leave school before completing their elementary education. This trend continues today. Latinas/os continue to have the highest dropout rates from high school of any racial–ethnic group in the United States (Pew Hispanic Center, 2004).

Sadly, the role that many school counselors played throughout this history is seemingly undocumented, and there are no publications regarding this topic. For example, a recent review of the history of school counseling (Gysbers, 2001) described the beginnings of the profession in the late 1800s as "a response to the economic, educational, and social problems of those times" (p. 97); however, social problems were described as referring more to child labor issues, rather than issues of racial and ethnic discrimination. Paisley and Borders (1995) implied the importance of race and ethnicity in their recent description of the evolution of school counseling as moving from "vocational and educational decision making, to personal growth, responsive services for special 'at-risk' populations, [and] to developmental programs" (p. 150), but they do not describe specific or unique historical issues related to this topic. In their review of recent trends in school counseling journals, Bauman et al. (2003) noted that articles with a multicultural focus went from 2% of all publications in the 1950s to 13% in the 2000s, indicating increased interest by the profession in race and ethnicity. Bauman et al. suggested that perhaps this increase was driven by recently revised Council for Accreditation of Counseling and Related Educational Programs (CACREP) standards that more directly incorporate these issues. Moreover, the American School Counselor Association (ASCA) developed a model training

program that "focuses on equitable access of direct services to all students" (Fusick & Bordeau, 2004, p. 103). Paisley and McMahon (2001) identified increasingly diverse student populations as one of the major challenges currently facing school counseling. Green and Keys (2001), however, contended that although the profession of school counseling has no doubt evolved to be more in line with student needs, effective developmental strategies are still lacking, particularly for students of color.

One might infer from readings of educational histories, as well as from individual anecdotes, that despite the founding principles of the profession, many school counselors may have played a role, albeit unintentionally, of supporting the status quo of segregation and helping to deny students of color access to the educational pipeline. Like others in the school system, such as teachers and principals, some school counselors likely communicated their biases in a variety of ways, both overt and covert, for example, by having low expectations regarding the potential achievement of students of color. Over the past few generations, many students of color have shared the oft-told tale of segregation's more modern form, tracking, where disproportionately larger ratios of youth of color were placed into special education classes and other low-achieving or compensatory curricula (Herring, 1997). In support of this contention, Green and Keys (2001) recently critiqued traditional models of school counseling as providing insufficient focus on the social contexts in which development occurs, thereby neglecting to incorporate the many unique struggles that students of color must negotiate in their schools.

Theory

Although theories of counseling have existed since the beginning of the field, applications of these theories with racially and ethnically diverse students have been only recently introduced. A key issue of counseling theories as they relate to school counseling is how they help counselors conceptualize students regarding the nature of growth and development, maladaptive behaviors, and intervention techniques (Stone & Bradley, 1994). Although any theory potentially might be useful in conceptualizing and intervening with children and youth of color, a number of theoretical approaches have been found to be particularly effective in working with these populations. Some examples include racial and ethnic identity development models, cognitive–behavioral strategies, and ecological systems approaches for both families and schools. All of these approaches will be reviewed to highlight their emphases and potential for effective interventions.

Racial and Ethnic Identity Development Theory

For more than twenty years, counselors and psychologists have proposed that educational achievement is linked to how students see themselves as racial and ethnic beings. In a seminal paper, Fordham and Ogbu (1986) argued that due to the history of racial discrimination and segregation, many people of color, particularly African Americans, distrust school systems and are skeptical of these institutions' commitment and ability to educate them, resulting in conflict and ambivalence about seeking an education as well as poorer school performance. Part of this ambivalence comes from societal pressure that many students of color may feel to conform to White cultural norms in order to succeed in school ("acting White"). Social sanctions exist for those African American students who attempt to assimilate to White norms and behaviors (e.g., speaking Standard English) as a strategy for academic success. "Acting White" is viewed by many African American community members as a denial and potential loss of Black identity:

> When I encounter a group of Blacks on the street in my home community, I can't go up to them and say, "Good afternoon, gentlemen. How are you doing today?' (i.e., greet them in Standard English). They would laugh at me and then feel sorry for me. They'd think, "Poor Charles, when he left here for college, he was OK (That is, he talked appropriately like us and maintained his Black identity). But now look what they've done (i.e., White people or White educational institutions) to him!" (i.e., he has learned to "talk proper or "act White"). (Ogbu, 2004, p. 25)

It is important to understand, however, that it is not school success itself that garners criticism from others, but rather assimilation to White ways of thought, speech, and action (Ogbu & Simons, 1994). That is, many African Americans and other people of color do not view making good grades negatively, but instead are critical of speaking Standard English, acting smart during lessons, and having many White friends (Ogbu & Simons, 1998).

Fordham (1991) further asserted that in most school systems, both public and private, "a strong separation of 'I from us' and 'me from thee' is not only expected but deemed absolutely essential for academic success . . . [this represents] an inversion of fictive kinship in the Black community" (p. 473), which celebrates the group or collective rather than the individual: "A striking feature of the African American Self is members' unilateral focus on density in their interactions, [incorporating] a broad, detailed knowledge of community participants" (p. 472). Black youth

are thus faced with a difficult—even impossible—choice between academic success and maintaining affinity with their communities. Indeed, Fordham reports that although many African American youth in private school settings may obtain excellent academic skills, the most important lesson learned may be "enduring the unendurable." One student described this process:

> Each of the two cultures considered me a foreigner, one who did not belong. Where my allegiance resided was their [both cultures'] question. Neither world [the housing project nor the prep school] fully understood me because these two cultures almost never meet. (Fordham, 1991, p. 478)

Distancing self from Black communities has been shown to be linked with depression (Arroyo & Zigler, 1995). Moreover, Ogbu (2004) described a number of strategies Black students may use to mediate these conflictual choices, such as (a) assimilation to White ways accompanied by a loss of Black identity and relationships, (b) adoption of White ways without giving up their Black identity or language, (c) opposition to engaging in any form of "acting White," and (d) encapsulation, or becoming raceless. Black students who choose the first two strategies—although high achieving—risk feelings of alienation, depression, and anxiety. Those students who engage in the latter strategies likely value other forms of education or learning than those found in traditional school settings, but may be at risk of poorer academic performance and dropping out.

Arroyo and Zigler (1995) found support for the negative psychological impact of adopting "raceless" strategies in their three-study project composed of mostly White and African American high school students. Interestingly, they found that components of racelessness, such as impression management, among both White and African American students. The authors speculated that high-achieving students of any race or ethnicity often feel pressured to choose academics over peer relationships. However, Arroyo and Zigler found that depression was clearly linked with racelessness for African Americans, but not for White students. Further, raceless attitudes were linked with negative collective self-esteem for African American students; these students felt their racial group was negatively viewed by others and were less identified with being Black.

Osbourne (1997) investigated a related phenomenon: disidentification, the lack of relationship between academic self-esteem and general self-esteem, which results from negative experiences with school, presumably due to reasons of racism and discrimination. Osbourne found that although White high school students' general self-esteem was stable through all years, African Americans' self-esteem increased from eighth to tenth grade, then decreased in the 12th grade, as did their grades and achievement scores (their self-esteem scores, however, were higher than Whites' scores). Hispanics' self-esteem increased over time, but their grades decreased, also showing a disidentification trend, though in a different way. Correlations between grades and self-esteem dropped over time for both Hispanics and African Americans, the most dramatic being for African American boys. Interestingly, the main exception to these latter findings was Hispanic girls, whose self-esteem and grades were increasingly linked over time.

School counselors can have potentially impactful roles in helping students negotiate these identity issues, for example, providing advocacy within the school system regarding norms and expectations about what are the factors that lead to academic success. Another avenue may be to provide a supportive and safe space for students to acknowledge and share with each other about these dilemmas, either through individual counseling or student support groups.

Helms (2003) proposed another way to conceptualize the importance of racial and ethnic identity to school success for students of color. The people of color identity development model proposes that individuals do not react identically to conditions of discrimination or privilege, but develop various schemas or strategies for interpreting these experiences (e.g., conformity, dissonance, immersion/emersion, and internalization). These strategies may be marked by naiveté and denial (conformity); ambivalence and conflict (dissonance); anger, curiosity, and growth (immersion/emersion); and awareness and acceptance (internalization). A key aspect of these identity models is that individuals experience conflict regarding their racial and ethnic identities that result in a variety of identity resolutions (Miville, Koonce, Darlington, & Whitlock, 2000). Helms has suggested that school counselors and other educators need to be aware of how students are dealing with experiences of racism and the cognitive and behavioral strategies they have adopted to cope with these experiences. For example, students experiencing dissonance or immersion may feel a great deal of anger and frustration regarding the racial status quo in the school system. Rather than responding with fear or minimization, counselors may develop interventions that help students to divert this emotional energy into positive outlets, such as a candlelight march to raise awareness.

Some scholars suggest that racial identity may be an important focus in helping students of color succeed in school (Ford, Harris, & Schuerger, 1993). For example, Parham (1989, as cited in Ford et al.) described two issues along racial identity lines with which gifted students of color may struggle: (a) "self-differentiation versus preoccupation with assimilation" (p. 411) and (b) "ego-transcendence versus self-absorption" (p. 411). The former refers to the importance

of valuing self regardless of negative messages from Whites and others in the environment, whereas the latter describes the importance of developing a sense of security about self in order to develop ego strength. Another way of describing these identity struggles is finding congruence with self and being freed of racial stereotypes imposed by others. School counselors also can teach students of color how to deal with feeling different from or inferior to both school and community members. The acknowledgement of these struggles by counselors is critical to helping students begin to cope with these feelings.

Thomas, Townsend, and Belgrave (2003) further suggested that racial identity issues might be integrated with Afrocentric values for a more effective conceptualization of ethnic identity for African American students, particularly those in low-income or inner-city-school settings. Afrocentric values refer to enduring cultural beliefs and practices of African Americans, including "a spiritual orientation, a deep sense of kinship and identification with the greater collective . . . , extended family structure as a social support network, and a philosophy of unity" (p. 219). Thomas et al. found that both racial identity and Afrocentric values were predictive of child–school adjustment, as measured by behavior control, school interest, teaching ratings of child problems and strengths. Moreover, racial identity and self-esteem were important mediators of the relationship of Afrocentric values and child–school adjustment. Afrocentric values and racial identity have also been found to be significant predictors of drug attitudes and use among African American students (Belgrave et al., 1994; Townsend & Belgrave, 2000). Further, racial identity has been a positive predictor of academic self-efficacy among African American eighth graders (Oyserman, Harrison, & Bybee, 2001).

Oyserman and her colleagues (Oyserman, Bybee, Terry, & Hart-Johnson, 2004; Oyserman, Gant, & Ager, 1995; Oyserman & Markus, 1990; Oyserman, Terry, & Bybee, 2002) also have conceptualized identity issues for students of color utilizing the construct of "possible selves." Oyserman et al. (1995) proposed that identity negotiation among youth of color "involves the dual task of assembling a positive sense of self while discrediting negative identities attributed to African American males and females" (p. 1217). Part of this identity negotiation involves visualizing hypothetical or possible selves across a number of dimensions, including academic and occupational areas. Possible selves are future-oriented and involve aspects of the self-concept that put self into action and motivate goal-oriented behavior; balancing of positive and negative selves is posited to lead to perseverance in tasks. Oyserman et al. (1995) asserted that it is critical that racial–ethnic identity incorporate achievement "within the context of being African American" (p. 1220). By doing so, students of color will not experience the tension between achieving academic success and embracing Black identity. Indeed, research shows that it is *both* awareness of racism and achievement as salient identity components that may be linked with better performance in math tasks, rather than either individual component. The construct of possible selves also is potentially useful in other ways for students of color. For example, Oyserman et al. (2004) found that having a possible self as a self-regulator was linked with better academic performance, doing homework, and class participation. Oyserman et al. (2002) described interventions based on developing a balance of possible selves to enhance school performance.

Although much theory and research on racial and ethnic identity has focused on African Americans, some research indicates that identity issues also are important to other students of color. For example, Rolon-Dow (2004) explored the construction of ethnic identity among Puerto Rican middle-school girls in the Northeastern United States. Rolon-Dow utilized Black feminist critiques in understanding the multiple ways in which schools and teachers may impose images on Latina girls. She found that teachers often viewed these girls as overly sexualized with their language and dress and, as a result, not educable or potentially successful in school. In other words, "the image of the hypersexual girl was cast in opposition to the image of an educable girl interested in her schooling endeavors" (p. 17). The girls also cast themselves within these restricted, either–or roles, with many adopting the stereotyped image for Puerto Rican girls associated with low success in schools. Rolon-Dow urged school personnel to examine the images and stereotypes both teachers and students may adopt, often unconsciously, that may determine the educational outcomes of these youth.

Ecological and Family Systems Approaches

Another fruitful area has been the incorporation of theoretical approaches that contextualize individual students within their multiple systems, such as families and schools. As McKenna, Roberts, and Woodfin (2003) noted, children belong to two substantive systems: families and schools. Thus, forging links between these two systems in viable and consistent ways is essential to the future success of students, particularly students of color. Partnerships between schools and families are viewed as so important that the U.S. Department of Education has made these a codified requirement of the National Education Goals (McKenna et al.). Indeed, there is a wealth of research indicating that the single best predictor of student achievement is parental involvement (Henderson & Berla, 1994). Given the issues of racism and discrimination as well as cultural values emphasizing familism and collectivism for many

racial–ethnic groups, parental involvement becomes even more important for school systems to cultivate in order to increase success for students of color.

Most family systems theories conceptualize children as being nestled within at least three to four generations. Problems that occur (e.g., a student who misses school) are conceptualized as not attributable to the individual, but as a "representative of a system that is faulty" (Goldenberg & Goldenberg, 2000, p. 10). Thus, it is relationships—for example, between parents and teachers—that become the target of intervention. A likely outcome of these interventions is to change the system(s), for example, by opening up new lines of communication or changing communication patterns, with the ultimate goal of further strengthening the systems.

Tucker (1999) and Yeh (2004) further suggested that the ecological model of Bronfenbrenner (1979) helps conceptualize the multiple systems present in most students' lives. These systems include (a) microsystems, such as the family, school, and neighborhood; (b) mesosystems, involving relationships among various microsystems; (c) exosystems, other systems that affect microsystems, such as parental employment, and (d) macrosystems, involving the values and norms of the larger society. As noted at the beginning of the chapter, most students will be negatively affected by the history of racism and discrimination at the macrosystemic level. Green and Keys (2001) further stated that it is critical students "be given opportunities to enhance their awareness of the multiple contexts that impact their lives" (p. 89). For example, they noted that students are best helped when both families and schools are consistent in their expectations and messages regarding appropriate behavior.

Juntunen, Atkinson, and Tierney (2003) described the role of school counselors as being potential liaisons at the mesosystemic level of schools, families, and community agencies. Within this framework, school counselors may be able to address some of the barriers that prevent school and families from working together. Such barriers include differences in language abilities, educational and literacy levels, communication styles, emphases regarding time and attendance, miseducation on the part of school officials regarding culturally different but effective parenting styles, and racial–ethnic tensions within the school setting. Juntunen et al. described a number of roles school counselors could play that could bring potentially disparate elements of school and family systems together, such as cultural interpreter or broker, referral base, advocate, program developer, social model for respect and acceptance, and mediator.

The ways in which counselors and teachers reach out to families is a critical first step toward building a bridge between families and school systems. Gaitan (2004) described a number of strategies that likely will be effective in reaching out to parents of color. These include

- building on cultural background, knowing important cultural values and including extended family, such as grandparents, aunts and uncles, and even older siblings;
- developing personal contact with parents, such as positive interactions, small talk, phone calls, and home visits;
- fostering communication by taking the initiative, making information accessible, and sharing experiences;
- creating a welcome environment that is warm, empathic, and engaging; and
- developing structural accommodations, such as parent centers, parent teams, and parent advisory committees.

It is also important to establish bidirectional relationships, particularly in inviting parents to discuss their expertise in disciplining or supporting their children. Evidence exists demonstrating how effective parents of color can be in shaping their children's academic success. For example, Romo and Falbo (1996) found that Latino/a parents whose children had graduated from high school had utilized the following strategies:

- Used two-way influence between parent and child
- Set limits
- Monitored the student
- Limited contact with peers about whom they had concerns
- Maintained a continuous message to their children to stay in school
- Were involved in school

As noted earlier, focusing on effective family-oriented strategies is key to the eventual success of many students at risk of low school performance. School counselors can liaison with families regarding their methods and create parenting groups to help identify such strategies.

Cognitive–Behavioral Approaches

Another theoretical approach that has been effective regarding the academic success of students of color is the cognitive-behavioral approach. This approach emphasize the link between thoughts and behaviors, and that the means by which to change behaviors is to the change the thoughts underlying them. As Pajares (2002) noted, "the beliefs [or cognitions] . . . that individuals create and develop and hold to be true about themselves form the very foundation of human agency and are vital forces in their success or failure in all endeavors (school)" (p. 1). Beginning with

Bandura (1986), cognitive–behaviorists have maintained that individuals are self-organized and self-regulating, and that central to this organization are beliefs they hold about their capabilities, also known as "self-efficacy." Self-efficacy refers to beliefs about self regarding the ability to "organize and execute the courses of action required to manage prospective situations" (Pajares, 2002, p. 8).

Self-efficacy influences behaviors in several ways, including choices of tasks, level of effort, perseverance, and resilience in the face of adversity. Sources of self-efficacy include mastery experiences (success with a task raises self-efficacy, whereas failure diminishes self-efficacy); vicarious experiences, particularly with a respected model; social persuasion (i.e., messages from others); and physiological states, such as anxiety, stress, and fatigue (Pajares, 1997). Considerable evidence exists showing the importance of positive self-efficacy in specific academic skills and tasks such as writing, mathematics, and motivation levels (Pajares, 2001, 2003). Current research, although sparse, indicates that many students of color, particularly African Americans and Latinas/os, may have lower academic self-efficacy, despite having positive self-concepts (evaluations about self as a whole). Given that self-efficacy perceptions influence such broadly important aspects of academic performance as choice of task, effort, perseverance, and anxiety level, assessing and intervening with self-efficacy beliefs may prove helpful to identify with "at-risk" youth (Pajares, 2003). Some recent research (De Los Santos & Miville, 2005) shows promise regarding academic self-efficacy beliefs as significant predictors of academic performance among Latinas/os. De Los Santos and Miville also found that biculturalism was a significant predictor of academic self-efficacy, indicating that involvement with both Latina/o and Anglo cultures was linked with positive beliefs about self in the academic environment.

Tucker (1999) also has developed academic interventions for students of color based on cognitive–behavioral approaches. Her research indicates that such interventions are effective if they are adapted for populations of color. For example, Tucker suggested that replacement of cognitions or self-efficacy beliefs needs to occur in a way that utilizes communication styles of the cultures of origin. She also strongly emphasized that cognitive–behavioral interventions should be contextualized within a self-empowerment paradigm which "focuses on facilitating self-motivation for academic achievement, self-control of academic progress (e.g., self-instruction-based learning), self-praise of academic progress and success, skills for academic success, and academic success behaviors" (p. 226). Tucker asserted that a focus on self-empowering strategies prepares students of color to perceive and facilitate their own academic success, regardless of their learning situation. She described a number of strategies that students, teachers, and counselors might use to help children and youth develop self-empowering strategies.

Research

Research regarding students of color, particularly in the realm of school counseling, has been sparse (Yeh, 2004). By far, the area of primary emphasis has been the alarming dropout rates of students of color discussed earlier in the chapter. Although clearly there are historical underpinnings for these rates, empirical research also has focused on identifying variables that may lead to the dropout rates, or conversely, help to retain students. Some of this research has already been described, particularly racial-ethnic identity variables that may play a role in student–feeling alienated from, or more hopefully, embedded within their school settings. Other variables that have been explored include (a) stereotype threat; (b) acculturation and acculturative stress; (c) language issues, particularly for newly immigrated students; and (d) resiliency. Although it is beyond the scope of this chapter to review all research findings relevant to each of these variables, I will highlight important findings and discuss future directions in research for school counselors working with students of color.

Stereotype Threat

Steele and Aronson (1995) coined the phrase *stereotype threat* to refer to "being at risk of confirming, as self-characteristic, a negative stereotype about one's group" (p. 797). As Steele (1997) further illuminated,

> it is a situational threat—a threat in the air—that, in general form, can affect the members of any group about whom a negative stereotype exists. . . . Where bad stereotypes about these groups apply, members of the groups can fear being reduced to that stereotype. And for those who identify with the domain to which the stereotype is relevant, this predicament can be self-threatening. (p. 614)

Stereotype threat has important implications for the academic performance of students of color for which stereotypes regarding their academic abilities abound in overt and covert ways. These stereotypes exist over and beyond the identity struggles already described of cultural values or roles that may discourage young students of color from becoming part of the academic world (Fordham & Ogbu, 1986). In addition, as Steele has argued, for those students of color wishing to be successful in academia who are already stigmatized regarding their potential abilities, stereotype threat can further push students from incorporating

academic success into their identities. Stereotype threat can occur to any social group member, including Whites and middle-class people, and is situation-dependent, such during as a math test. Individuals do not have to believe in the threat themselves in order to be affected by it (e.g., their performance diminished as result). Moreover, stereotype threat has the greatest impact on more confident or academically identified students because they still see themselves as part of this domain. In contrast, low-performing students already may have disidentified as "good students" and not even attempt academic tasks. Evidence exists (Aronson, 2002; Steele, Spencer, & Aronson, 2002) indicating that stereotype threat is a factor in the lowered performance of many social group members, including African Americans and Latinas/os, for a number of academic tasks, such as reading and mathematics exams and standardized tests, including the Scholastic Achievement Test (SAT).

Two factors may be at play regarding potential areas of intervention for stereotype threat: (a) evaluative scrutiny, which may be associated with decreased enjoyment of learning, increased stress and anxiety, and lowered performance, and (b) group composition of those taking a test. In a series of interesting studies, Aronson and his colleagues (Aronson, Fried, & Good, 2002; Good, Aronson, & Inzlicht, 2003) examined how students' beliefs in the malleability of intelligence (vs. beliefs of the inherent nature of their limited abilities, as based on race and ethnicity) might affect performance. They arranged for college students to mentor seventh graders who were mostly students of color from low-income backgrounds. The college students highlighted the notions that intelligence was changeable and that the difficulties the younger students were having were due to being in a new school setting. The students in the experimental condition involving mentoring scored significantly higher on standardized reading tests than those in a control group. These findings indicate that it is possible to mitigate the effects of stereotype threat, for example, with messages to counter the immutability of academic potential due to presumed racial or ethnic heritage.

Acculturation and Acculturative Stress

Numerous definitions and models of acculturation exist, some of which are based on a particular racial–ethnic group, such as Mexican Americans or American Indians, and others that focus on a general approach presumably applicable to any racial–ethnic group. Most models and definitions of acculturation focus on an interactive learning process between an individual and a dominant host culture or society, such as Anglo society in the United States (Coleman, 1995; Gloria & Rodriguez, 2000; Stephenson, 2000). Models of acculturation generally are based on the presumption that the interactive learning process necessarily occurs in a sociopolitical context (Berry, 1993) and provide the basis for understanding how individuals may cope with and develop differently from one another within this context.

Many acculturation models distinguish between transmission of cultural information that emanates from politically dominant or host cultural groups (what some scholars refer to as "second culture acquisition"; LaFromboise, Coleman, & Gerton, 1993), and transmission of cultural information that emanates from one's racial–ethnic group. LaFromboise et al. distinguished six strategies in which second culture acquisition may occur. The first three represent traditionally linear approaches—(a) assimilation, (b) acculturation, and (c) separation—in which individuals may either attempt to join the second culture (acculturation or assimilation) or withdraw from or avoid the second culture (separation; Coleman, Casali, & Wampold, 2001). More recent conceptualizations of second culture acquisition reflect integrative processes, where involvement in both cultures is presumed. In other words, immersion into both dominant and ethnic cultures may be orthogonal, rather than polarized, processes (Oetting & Beauvais, 1991). These strategies include (a) alternation, involving changing from one set of cultural behaviors to another, based on the situation; (b) integration conceptualization, in which individuals interact with culturally different others, but maintain their own cultural identity; and (c) fusion conceptualization, involving the development of a new culture from the fusion of two or more cultures. Most assessment instruments of acculturation attempt to determine participant levels of acculturation, assimilation, separation, alternation, fusion, and/or integration (Coleman et al., 2001).

Coleman (1995) proposed a model for better understanding acculturation strategies that highlights goals individuals wish to achieve in particular settings, such that "the context in which an individual is coping with cultural difference and the goals that individual wants to achieve in that context [e.g., school] will influence the individual's choice of strategy" (Coleman et al., 2001, p. 357). Coleman et al. further asserted that choice of strategy occurs sequentially and arises from "a series of choices, consciously or unconsciously, about how he or she wants to associate with the new and old cultures" (p. 358). The first choice involves whether to associate with more than one cultural group, followed by deciding the extent of association with these groups. Thus, Coleman and his colleagues suggest that choices regarding second culture acquisition depend upon individuals' socialization, the context in which second culture contact occurs, and the goals individuals are attempting within that context.

Acculturation processes are believed to shape critical aspects of psychological functioning, including core beliefs, choice of language, attitudes, and expectations of behaviors. Indeed, inconsistencies and conflicts between cultures are often a source of stress for many people (Gloria & Rodriguez, 2000; Kim & Abreu, 2001), including students of color. Other scholars (Garza & Gallegos, 1995), however, have noted that interactions between cultures can also have positive outcomes, including increased academic performance, psychological adjustment, and the development of leadership skills.

Research on the link between acculturation and academic performance is sparse but suggests that acculturation processes and choices may affect academic performance. Coleman and his colleagues (Coleman, 1995; Coleman et al., 2001; Hamm & Coleman, 2001), for example, found that adolescents' choices regarding second culture acquisition were indeed context-dependent. Moreover, African American adolescents were more likely to use separation strategies than their White counterparts. Coleman et al. suggested that students might use one set of second culture acquisition strategies in one setting, such as assimilation or acculturation in the classroom, and another set of strategies in another setting, such as separation in a social situation.

Other research indicates that the link of acculturation with academic performance is complex and often produces mixed effects. For example, Lopez, Ehly, and Garcia-Vasquez (2002) found that high school "students identified as highly integrated and strongly Anglo-oriented bicultural tended to have higher academic achievement" (p. 245). Chea (2003), however, found that Cambodian adolescents between the ages of 12 and 17 who adhered to their culture of origin did well academically. Further, Tencer Garrity (2003) found that bicultural Latina/o students in Illinois (third and fourth graders) did not have high self-esteem and high academic performance. Adams (2000), using structural equation modeling, found that among 266 Mexican-American elementary schoolchildren, generation and socioeconomic status (SES) influenced acculturation which, in turn, influenced learning preferences (cooperative learning) which then affected academic performance for traditional Mexican-American students. Finally, research on Native youth in Alaska revealed that performance in mathematics and science was significantly improved for students participating in a three-year cultural program, as compared with students who did not participate in the program (Demmert, 2001).

It is clear that a great deal of further research is needed to explore how acculturation processes might be linked with academic performance. Theory- or model-driven research may help better illuminate these complex findings. Moreover, exploring how second culture acquisition differs among various racial–ethnic groups, such as Latinas/os and African Americans might further untangle this relationship. Finally, exploring context or school setting in which students are placed (e.g., White-dominated or ethnic-group-oriented) may be a critical moderating variable in the relations of acculturation and academic performance.

Immigration Status and Language Abilities

Intermingled with acculturation issues are the impact of immigration status and students' language abilities, particularly for limited-English-proficient students, on academic performance. For example, among Latinas/os, the largest immigrant group in the United States today, immigration status is the strongest predictor of the dropout rate (Garcia, 2001). Further, although the United States is now the fourth largest Spanish-speaking nation in the world, most school systems are based on English language proficiency.

Since the 1960s, U.S. school systems have been receiving a large number of newly immigrated students of color, mostly from Latin America, Asia, and the Caribbean (Roysircar-Sodowsky & Frey, 2003). Little information is available on the needs and stressors concerning these children and adolescents, although some research exists for late adolescents and college students. Important variables to consider are whether students themselves are newly immigrated, whether they immigrated as children or as adolescents, or are whether they are children of immigrants. Each of these statuses may influence, for example, the racial–ethnic identity these children and youth adopt and the level of stress they may experience in the school systems. Immigrant status has also been linked with a number of psychological issues that, in turn, may affect academic performance, including acculturation, changes in family relationships, self-esteem, anxiety, depression, and stress (Roysircar-Sodowsky & Frey).

Research on the impact of immigrant status on academic performance indicates a number of stressors might impede success in schools for many newly immigrated students. A major stressor appears to be adjusting to culture shock, as well as developing new skills and competencies that will facilitate success in school (Bemak & Chung, 2003). Without these new skills and competencies, evidence demonstrates that students may reject school-appropriate norms and behaviors in an effort to maintain their native cultural background (Gibson, 1997). Adjustment involves not only learning a new language and different ways of studying (e.g., individualistically oriented tasks), but also learning to deal with issues of racism, ethnocentrism, and discrimination as students of color that they may not be accustomed to or socialized to withstand. Moreover, antischool attitudes predominant in some urban settings will need to be addressed by these youth and their families, hopefully with the help of school counselors, to prevent disidentification

with school and dropout (Bemak & Chung, 2003). Unfortunately, very little research exists demonstrating effective strategies for helping immigrant students of color to negotiate struggles arising from acculturation, language differences, and preexisting conditions that also might diminish academic performance. Future research might examine the impact of each of these variables—as well as their combination—on children of varying immigration status, age, and race–ethnicity.

Language abilities also affect many students of color, both newly immigrated students as well as those coming from racial–ethnic backgrounds that emphasize maintenance of native languages as part of their heritage and identity, such as Latinas/os. Historically, bilingual abilities have been viewed as a handicap, rather than an asset, to the learning environment (Pearson, 2001). Indeed, for much of the 20th century, many educators believed that being bilingual actually slowed learning and diminished intelligence, rather than increased performance and cognitive complexity. Unfortunately, most studies between the late 1800s until the 1960s yielded findings linking bilingualism with lower academic performance; however, recent reviews of this research have revealed many were flawed in their methodologies, including their definitions of intelligence and sampling techniques (August & Hakuta, 1997; Hakuta & Garcia, 1989).

Biases toward bilingualism also have been reflected in public policies affecting school systems that serve bilingual students. For example, a landmark and progressive 1976 law passed in California enabling education programs for limited-English-proficient students framed the issue as a "language problem" to be solved by transitioning students from their native language into English, with an unfortunate outcome of prejudicing these students against their own languages (Gándara, 2001). In short, the legislated goals of bilingual program were to dispense with native languages as quickly as possible, in order that English might be learned.

Although bilingual education continues in many public schools, legislation in more recent years has reflected increasingly hostile attitudes toward providing funding emphasizing learning in school using any other language than English. The ongoing debate regarding bilingualism in the United States may be summarized this way: "Is bilingualism strictly the knowledge and usage of two linguistic systems, or does it involve the social dimensions encompassed by the languages?" (Hakuta & Garcia, 1989, p. 374). Hakuta and Garcia illustrated the complexities of these issues for limited-English-proficient students in the following statement of a recently immigrated Mexican 9th grader:

> There is so much discrimination and hate. Even from other kids from Mexico who have been here longer. They don't treat us like brothers. They hate even more. It makes them feel more like natives. They want to be American. They don't want to speak Spanish to us. . . . If they're with us, other people will treat them more like wetbacks, so they try to avoid us. (p. 374)

In the face of strong criticism regarding the need for more effective programs targeting limited-English-proficient students, scholars today emphasize the potential positive impact of dual language learning (Calderon & Carreon, 2001). Recent research indicates that learning in a second language may actually facilitate cognitive functioning, particularly cognitive flexibility and metalinguistic awareness (August & Hakuta, 1997). More sophisticated research has revealed that language learning, whether first- or second-language, uses the same basic cognitive processes, and that learning dual languages "share[s] and build[s] upon a common underlying base rather than compete[s] for limited [cognitive] resources" (Hakuta & Garcia, 1989, p. 375).

A related issue concerning bilingualism refers to children and youth serving as language brokers for their parents, other family members, and other adults, such as school administrators. Often, as families transition into a new cultural setting, children become the first members to learn English, resulting in their serving as translators and interpreters for others. These youth are often placed in complex, adultlike situations and are called upon to utilize more sophisticated skills in language and social interactions than other peers their age do. In a recent review of literature on language brokering, Morales and Hanson (2005) found that the majority of immigrant children, particularly females, served as language brokers, sometimes beginning as young as eight years of age, and translated and interpreted in a variety of settings, including school. Findings have been mixed regarding the psychological impact of language brokering, ranging from feelings of pride to frustration and embarrassment.

Language brokering may facilitate cognitive development, including a more sophisticated vocabulary, higher cognitive abilities and better problem-solving abilities, as well as being able to switch languages across settings and roles (Buriel, Perez, De Ment, Chavez, & Moran, 1998). Due to the cognitive complexity required of these tasks, some scholars have proposed that language brokering may facilitate school performance. For example, Buriel et al. found that for 122 Latina/o adolescents, language brokering was positively related with academic performance, and feelings about language brokering were positively linked with academic self-efficacy. Orellana and Bowman (2003) also found that language brokering was linked with increased performance on standardized reading and math tests. However, some scholars warn that pressures associated with the role

of language broker in the family may be linked with early dropout or restricting of academic goals. Further, risks of children being placed in more adult roles and settings (e.g., explaining serious medical test results to parents) might lead to traumatizing outcomes for some of these youth, if limits are not placed on their brokering responsibilities. In sum, Morales and Hanson (2005) encourage further research in this area, particularly the impact of language brokering on the social and cognitive development and academic performance of students of color.

Resiliency

In addition to examining the impact of potential barriers on the academic achievement of students of color, some scholars have begun to explore potential protective factors to help mitigate the impact of these barriers. Resiliency refers to "the capacity of an individual to overcome difficult and challenging life circumstances and risk factors" (Bryan, 2005, p. 220). In short, resiliency is the ability to continue in the face of adversity, either by drawing strength from rising up to challenges or by not being detracted by such challenges. Resiliency is a capacity that can be fostered in a number of ways, such as interactions with skilled others, meaningful participation in schools and communities, reasonably high expectations regarding student performance, and a positive self-concept (Bryan, 2005; Gordon, 1996). In a review of resiliency studies, Rak and Patterson (1996) found several types of protective factors that increased the resiliency of potentially at-risk children, including personal characteristics, family conditions, environmental supports, and self-concept factors. Crosnoe and Elder (2004), for example, found that supportive relationships with parents were significantly important in helping to promote academic achievement in high school students of color. They further found positive relationships with teachers were linked with better academic performance.

Gordon (1996) explored important differences among Hispanic youth, using a sample of 36 participants, characterized as resilient (n = 9) and nonresilient, drawn from a pool of 123 Hispanic high school sophomores. Students identified as resilient came from low SES and stressful backgrounds and had a relatively high GPA (2.75 or better); nonresilient youth were from similar backgrounds, but were not achieving well academically. She found that resilient youth believed in their cognitive abilities, such as comprehension skills, and placed less importance on belongingness regarding their families and friends. Gordon interpreted the latter finding as a protective factor regarding the avoidance of negative peer pressure. Resilient youth also had stronger, more tenacious motivation regarding their cognitive abilities, and placed less emphasis on personal relationships, in contrast with nonresilient youth.

Using a similar method, Gordon (1995) also explored differences among 40 resilient and nonresilient African American high school students, drawn from a participant pool of 138 students. She found that, as with Hispanics, resilient African American youth had significantly different, more positive self-concepts, including beliefs about their cognitive abilities, environmental support, control over their cognitive goals, and recognition of the importance of these goals. These dimensions point to a stronger motivational pattern regarding academic performance. Resilient youth also placed greater emphasis on extracurricular activities and their relations to academic skills as well as on material gain; however, resilient and nonresilient youth differed minimally in terms of their social self. Gordon interpreted this finding as indicative of the dual cultures in which African Americans must operate, such that "being socially motivated may be vulnerability inducing for them . . . because their peers may see them as 'weird' or 'odd'" (p. 253).

Miller and MacIntosh (1999) examined how racial socialization and racial identity might serve as protective factors in promoting the resiliency of African American adolescents. Racial socialization refers to "the responsibility of raising physically and emotionally healthy children who are Black in a society in which being Black has negative connotations" (Peters, 1985, as cited in Miller & MacIntosh, p. 160). The authors describe racial socialization as providing a "suit of armor" against the hostilities of the environment. Participants included 131 African American adolescents in an urban school setting who completed measures of stress, racial socialization, racial identity, and collective self-esteem. Demographic information collected included GPA, school involvement, time spent on homework, and school attendance. Regression analyses indicated that positive racial identity and racelessness predicted higher GPA, although racial socialization and collective self-esteem did not.

Wayman (2002) hypothesized that educational resilience factors might play a role for students who return to obtain their high school degree after dropping out. He utilized longitudinal data gathered by the National Institute on Drug Abuse exploring substance abuse and other factors among 519 Mexican-American and non-Latino high school youth who had dropped out of school. Several types of resilience factors were included, as based on personal, family, peer, and school factors. Personal factors included personal self-esteem dimensions, including competence, self-confidence, and social acceptance, as well as attitudes toward high school completion; family factors were composed of family school support and family caring; peer factors included both alienation and support items; and school factors included extracurricular involvement, school liking, relationship with teachers, perception of school success,

teacher caring, and supportive school environment. Logistic regression analyses indicated perception of school success, and peer educational support predicted degree attainment, and self-esteem; intent to graduate and identification as a student predicted type of degree (diploma or GED). Wayman noted that a primary benefit of exploring resilience factors among dropouts is that these factors "are typically more proximal to the student and thus make better use of the information that these students have to offer" (p. 176).

In sum, the research on resiliency among students of color provides a promising avenue for future research. Although some ambiguity exists regarding the definition of resiliency (Miller & MacIntosh, 1999), exploring the impact of protective factors that help youth recover or persist in the face of overwhelming odds is critical to identifying and developing effective interventions with these students. Future research needs to be conducted on a wider range of students from different grades, as well as, different racial–ethnic groups.

Practice

Thus far, I have reviewed theory and research most relevant to working with racially and ethnically diverse students. Many of these issues may be expressed as mental health concerns, such as identity development, self-esteem, culture shock and acculturative stress, depression and anxiety, and low motivation, each of which ultimately affect the retention and academic achievement of these students; as noted earlier, nearly half of all students of color are lost from the academic pipeline during the elementary and secondary school years. It is therefore critical for school counselors to develop and provide essential services and interventions that can help stem this tremendous loss for individuals, their families, and their communities, as well as the larger society.

Indeed, although the situation is dire, it is important to point out that there are schools whose personnel exhibit beliefs, attitudes, and behaviors that create a learning community that positively influences student achievement and personal functioning (Carey & Boscardin, 2003). Several educators have identified common factors of schools and school personnel that have been effective at retaining students of color (August & Hakuta, 1997; Darder, Torres, & Gutierrez, 1997; Gaitan, 2004; Romo & Falbo, 1996):

- put learning of students first (teachers, administrators, and counselors)
- clarify scholastic standards as skill-based, communicate high standards, and have accountability
- make participation rewarding
  - discourage skipping, encourage attendance
  - create strong peer groups
- emphasize hard work and persistence, not just abilities
- make schools accessible
  - involve parents in respectful and genuine ways (e.g., advocates, volunteers)
  - where appropriate, have bilingual personnel
  - share information in many ways (e.g., focus groups)
- create clear pathways to good outcomes
  - provide link to jobs, organizations, communities, higher education

Thus, there have been schools whose personnel were engaged such that their beliefs, attitudes, and behaviors created a learning community that positively influenced student achievement and personal functioning (Carey & Boscardin, 2003). Simply stated, it is people who matter most in promoting positive student outcomes. As Carey and Boscardin observed: "School counselors have the opportunity to play a crucial role in helping all constituencies [in a school system] collaborate in creative ways to produce positive outcomes that will benefit all those invested in creating a multiculturally effective school environment" (p. 278).

With the approval of the "Guidelines on Multicultural Education, Training, Research, Practice, and Organizational Change for Psychologists" by the American Psychological Association (APA; 2003), mental health professionals now have some general guidelines by which to develop and evaluate their interventions with diverse students. For example, Guideline 1 highlights that all mental health professionals are cultural beings who "may hold attitudes and beliefs that can detrimentally influence their perceptions of and interactions with individuals who are ethnically and racially different from themselves" (APA, p. 382). Thus, Guideline 1 states that multicultural competence begins for school counselors primarily by developing awareness regarding biases, stereotypes, misinformation, and the like regarding culturally different people. Guideline 1 strongly urges the avoidance of the "color-blind" approach (e.g., people are people), instead promoting the development of more complex social attitudes and worldviews that incorporate the multiple identities that people (including school counselors and their clients) may adopt.

In Guideline 2, mental health professionals "are encouraged to recognize the importance of multicultural sensitivity/responsiveness to, knowledge of, and understanding about ethnically and racially different individuals" (APA, 2003, p. 385). Thus, in addition to awareness of attitudes and biases, school counselors must develop an adequate racial–cultural knowledge base regarding their students, including historical influences, sociopolitical pressures and precedents, legal and policy issues, language concerns,

values, customs, beliefs, acceptable behaviors (both verbal and nonverbal), social competencies, and important psychological processes, such as acculturation and racial and ethnic identity development.

Guideline 5 states that mental health professionals "are encouraged to apply culturally appropriate skills in clinical and other applied psychological practices" (APA, 2003, p. 390). This guideline applies to school counselors in at least two general ways. The first refers to learning to use general or microskills in culturally appropriate or sensitive ways (Ivey & Ivey, 2002). Thus, one focus of Guideline 5 is to promote the use of general counseling skills (e.g., attending, focusing, reframing) that invite dialogue among the various constituencies in school systems about issues of racism, oppression, discrimination, and so on. It is essential that persons in the more powerful or privileged positions (e.g., counselor, teacher, principal) initiate this dialogue given its sociopolitical and emotionally evocative nature (Ancis & Ladany, 2001). A second way to apply Guideline 5 to school counseling is in the provision of culturally appropriate techniques for specific racial and ethnic groups (e.g., NTU therapy) as well as indigenous healing methods (e.g., sweat lodge ceremonies). Culturally specific techniques are particularly important to utilize in school settings that primarily serve racially and culturally different students. Learning these techniques involves becoming familiar with indigenous forms of healing, as well as bridging with indigenous healers within the local community (Sue & Sue, 2003). Another way of approaching school counseling within Guideline 5 is to provide intervention strategies for specific topics (e.g., dealing with racism, identify conflicts, sexual education) that target racial and cultural groups.

A final guideline, Guideline 6, is particularly critical for school counselors to keep in mind, given the history of school systems' negative treatment of racially and ethnically diverse students, in which mental health professionals "are encouraged to use organizational change processes to support culturally informed organizational (policy) development and practices" (APA, 2003, p. 392). As already noted, school counseling does not occur in a vacuum. Indeed, school counseling that is provided with an eye to a larger context that emphasizes multicultural competence at *all* levels of students' experience with their school systems will be more effective than school counseling where this does not occur. One theoretical approach discussed earlier was ecological frameworks, which purport that school counseling necessarily occurs in a context, and that counselors' attitudes, knowledge, and behaviors are part of the context in which students learn, and hopefully survive and thrive.

Several scholars have identified ways in which these guidelines may be applied specifically to school counselors in their interventions with students of color and their families and communities. For example, utilizing ecological approaches, Juntunen et al. (2003) described the various roles that school counselors can play as liaisons among schools, families, and community agencies. These roles include being a cultural interpreter or broker, referral base, advocate, program developer, social model for respect and acceptance, and mediator. By adopting multiple roles, school counselors may be able to address some of the barriers that prevent students of color from being successful in today's school systems. Such barriers include differences in language abilities, educational and literacy levels, communication styles, emphases regarding time and attendance, as well as miseducation on the part of school officials regarding culturally different but effective parenting styles and racial-ethnic tensions within the school setting.

A major area in which school counselors may play a more effective role in combating institutionalized racism and ethnocentrism is by developing more effective or alternative assessment interventions that essentially "detrack" students of color. Hancock (1994, as cited in Tamminga, 2002) defined alternative assessment as "an ongoing process between the student and teacher [or counselor] in making judgments about the student's progress, using nonconventional strategies" (p. 1). Del Vecchio, Gustke, and Wilde (1998) provided the following "alternative assessment" approach as a more effective way to assess racially and ethnically diverse students. Assessment must incorporate the following:

- Clearly defined purpose
- Information gathered over time
- Assessing broad progress in multiple skills, such as conceptual understanding, problem solving, reflective thinking
- Focusing on process, not just drills
- Integrating diversity, such as language and learning styles (e.g., cooperative, rather than individualist/competitive)
- Active student and parent involvement
- Climate of trust
- Use of anecdotal records and observations, classroom products, checklists

By following these guidelines, school counselors can help ensure that students of color will be accurately assessed in terms of their strengths as well as the growth areas.

Involving students in community or bridge programs is another effective way of increasing motivation to achieve and complete school. Programs such as GEARUP and Upward Bound help provide targeted assistance to students that personalizes their unique goals and visions, increases academic self-efficacy, and connects them to more realistic and attainable goals (McLure & Child, 1998; O'Brien et al.,

2000). By personal visits to and from university officials, students also may receive greater recognition for their academic achievements. These programs help develop critical educational skills, such as verbal expression, writing, and learning how to negotiate larger educational systems such as admissions applications and financial aid. A major purpose of these programs is to bring closer the long-term goal of completing an education, a goal that often seems out of reach and impossible for many youth of color.

Other intervention ideas might involve parent/child programs, where students attend their parents' work settings for a day, career days, and university campus visits. Linking students to national networks and scholarship also is a vital intervention for many of these youth, given that financial woes often are the primary reason why students do not seek higher education. Herring (1997) described many other innovative practices that school counselors can use with racially and ethnically diverse students.

Ultimately, a primary goal for school counselors is to help engender a climate of trust and respect within the school system to which students belong. This may be achieved in a number of ways, in addition to those promoted through the Guidelines. Focusing on student strengths, rather than deficits, is generally viewed as a more effective approach (Bemak & Chung, 2003; Tucker, 1999). Consultation with other school personnel, families, and communities also is key to establishing a positive and engaged learning atmosphere. In particular, drawing in families, especially parents, has been viewed as essential to helping students stay in school and complete their education. Important questions school counselors might ask to begin their work include the following

- Who are the students being served?
  - examples include race, ethnicity, SES, generation, migration
- What are current educational challenges of these students?
  - helps to identify goals
- What are current educational successes of these students?
  - helps to identify strategies
- What are available resources?
  - helps to identity the means by which goals and strategies may be achieved (e.g., personnel, budget, space)

Future Directions

In this chapter, I have described theory, research, and practice issues of relevance to race and ethnicity in school counseling. Beginning with historical considerations, it is clear that the current difficulties facing many students of color and the school systems that serve them emanate from exclusionary laws and discriminatory policies of the past. These historical forces have helped to shape current theory and research, including the challenge for many students regarding the healthy development of their racial and ethnic identities; the inclusion of people and systems critical to these youth, particularly families; and the development of interventions that are effective and sensitive to these youth's cultural values and norms. Research on students of color has focused on such diverse topics as identity development and the impact of stereotype threat, acculturation and acculturative stress, immigration status and language abilities, and resiliency. Each of these areas provides promising directions for further research, particularly in identifying potential areas of strengths of students of color that can be incorporated into interventions (e.g., language differences as reflecting increased cognitive complexity). Unfortunately, research on students of color remains sparse and lacks programmatic emphases (Yeh, 2004); however, numerous grant projects and professional organizations today are targeting the needs of racially and ethnically diverse students. Although not a mandate, the recent approval of the Multicultural Guidelines (APA, 2003) as well as the model program approved by the ASCA, signifies the importance of considering race and ethnicity in the theory, research, and practice of school counseling. Several books, most notably by Herring (1997) and Pedersen and Carey (2003), are now available that focus specifically on school counseling issues for diverse student populations.

In considering future directions for theory, research, and practice regarding race and ethnicity in school counseling, it is critical to consider the continuing needs of students of color, particularly strategies and approaches that help motivate these youth to continue their education. Without a specific focus on race and ethnicity, it is likely that racially and ethnically diverse students will continue to be lost from the educational pipeline.

XIV
AFRICAN AMERICAN EMPOWERMENT IN SECONDARY SCHOOL COUNSELING

LEON D. CALDWELL AND BETTINA M. BEECH
University of Nebraska, Lincoln

RICHARD OLDFIELD AND VANN PRICE
North Star High School, Lincoln, Nebraska

The psychological well-being of African American students deserves greater attention in the literature, given the amount of research describing the academic underperformance. This is especially true of African American boys, who are disproportionately represented in special education classes and have an alarming prevalence of adolescent psychopathology diagnosis (i.e., attention deficit disorder, attention deficit with hyperactivity disorder, conduct disorder, etc.), (Porter, 1997). While the analyses of African American academic underachievement are replete in the literature, studies investigating resilience and protective factors for African American boys are scant. Even more distressing is the dearth of school counseling literature disseminating prevention interventions that promote academic performance, reduce academic underperformance, and address psychological well-being. This chapter asserts that school counselors have a role in developing prevention intervention for underserved students. We then propose the Progressive School Counseling Advocacy Model; next, we discuss the African American males and educational interventions, and then we provide an example of a culturally consistent school-based intervention, the African American Empowerment Curriculum (AAEC). Finally, we discuss the implications of this approach for school counselors to develop culturally responsive interventions.

SCHOOL COUNSELING AND PREVENTION: A MATTER OF PUBLIC HEALTH

School counselors have a unique role within the education system. While their primary role is to support the educational mission of the school, they provide socioemotional support to students and families. School counselors are conduits and brokers between educational success and psychological well-being. Shrinking resources and expanding student problems, however, have varied the task of professional school counselors. Administrators, pressured to respond to national mandates, place greater resources in student achievement than in student health. Several researchers have demonstrated that academic performance and student health are associated (Arroyo & Ziegler, 1995; Davis, Ajzen, Suanders, & Williams, 2002; Kiesner, 2002). Particularly during adolescence, developmental changes and challenges may lead to mental health disorders (Lambert, McCreary, Joiner, Schmidt, & Ialongo, 2004) (e.g., conduct disorder, depression, anxiety disorder) and the adoption of risk behaviors (e.g., substance abuse, teen parenting, suicide) if protective factors are absent (Aro, 1994; Fuller, 1992; Keisner, 2002). Given this critical developmental period, secondary school counselors

have access to adolescents at a point that could impact the national public health agenda.

Despite their importance, school counseling resources, like many other school resources, are shrinking. The suggested counselor-to-student ratio proposed by the American School Counselor Association (ASCA) serves only as a reminder of the U.S. educational systems' distance from the ideal. Creativity is required of successful school districts in the face of resource starvation. Considering the public health implications of educational failure, we call for proactive instead of reactive models of intervention by school counselors.

A comprehensive school guidance model (Gysbers, 1990) is one example of how to insert prevention intervention to meet the needs of high school students regardless of students' risk classification. Risk behavior prevention and health promotion in the form of curricular units satisfies the needs of administrators who are concerned with compliance to national mandates. In addition, curricular-based intervention models offer a cost-effective and efficient method of meeting students' social-emotional needs. The advantage of moving beyond remediation is that greater numbers of students benefit from primary prevention rather than secondary or tertiary interventions. Too often, the requirement for services is an at-risk label (Porter, 1997). Of course, the problem with the "at-risk criterion" is that not all students may demonstrate psychological need with misconduct (Spencer, Kim, & Marshall, 1987). In fact, depending on the student's characteristics, misconduct is rarely followed by a mental health screening. We argue that the common intervention approach—serve the high-risk first—may account for the increasing numbers of students in that high-risk category. This conclusion can be easily reached if you begin with an assumption that all students at this developmental stage are "at-risk" and, therefore, in need of interventions (Aro, 1994).

Erford, House, and Martin (2003) asserted that two essential ideological shifts are necessary as the school counseling profession prepares for the 21st century: (1) the need to understand and apply the language of educational reform to school counseling and (2) the need to advocate for all students, not just some students, on important educational issues and their continuous improvement. While these proposed shifts clearly allow for more inclusive school counseling practices, they narrowly render the role of school counseling as an agent of educational systems. The emerging role of school counselors as violence prevention interventionists, high-risk student service providers, and agents of diversity and multicultural sensitivity (Erford et al., 2003) has implications well beyond educational institutions. We assert that the emerging realities of school counselors require an additional ideological shift: the need to place the roles and duties of school counselors within the continuum of public health.

This assertion is a matter of semantics, to a great extent. School counselors, by nature, have been local (i.e., school building or district) interventionists. This additional shift, however, places the school counselor as an important component of a national priority (i.e., public health) contrary to its current undesirable position in the achievement score chase. School counselors, depending on the resources, have engaged in group interventions for specific groups of students and have addressed school topics (e.g., suicide, eating disorders, etc.) as the need arises. By proclaiming a prevention and health promotion approach, however, school counselors begin to connect with a discourse that extends beyond school building parameters. Prevention and health promotion are a matter of public health for minority adolescents (see Wilson, Rodrigue, & Taylor, 1997). Prevalence trends in child and adolescent psychopathology suggest growth in numbers of school-aged children who require several layers of service. We purport that school counselors should enter the discourse on adolescent health from a public health perspective or it will be relegated to a reactionary position. In fact, school counselors should be on the vanguard of health interventions given the importance of school outcomes to quality of life.

Furthermore, we believe that given the nature of compulsory education, schools are important in dispensing various health interventions to underserved populations, especially ethnic/racial groups who have been historically marginalized and disenfranchised by status quo health enterprises. Native American, African American, Latino, Hispanic, and Asian American children and adolescents are likely to come from families who are described in health care and health status disparities (see LaVeist, 2005). The Surgeon General's (U.S. Department of Health and Human Services, 1999) mental health report and supplement outlining minority health disparities created national concern. School counselors could be extremely important in reducing health care disparities, as schools are often the first manifestation of health concerns. Thus, well-trained school counselors are also the first responders to health behaviors for children and adolescents. For this reason, we place great importance on the school counselor's role in service delivery to students from underserved populations. Schools offer excellent opportunities to disseminate a myriad of interventions that while not directly educational, have a grave impact on learning. For example, interventions that address depression, test anxiety, and suicide are extremely important to the learning process (Kaslow, Price, Wychoff, Grall, Sherry et al., 2004; Keisner, 2002; Sagrestano, Paikoff, Holmbeck, & Fendrich, 2003). This is especially important for those communities who have

historically underutilized professional community-based services.

School Counselors and Health Disparities

Given the reported health disparities in the United States, schools can be a repository of interventions that impact health and learning for African American students and families (Bemak, Chung, & Murphy, 2003). We propose that school counselors can be instrumental in addressing public health initiatives aimed at reducing health disparities. Unfortunately, even despite several national headlines about school violence, some school administrators and board members need convincing that mental health is as important to the learning environment as sports teams are to school community building. Although some school administrators dismiss mental health as part of the mission of education, others recognize that healthy students are optimal learners (Keisner, 2002).

School counselors, like school psychologists, if properly trained, can provide screening, referral, and prevention interventions for children and adolescents who are uninsured or underinsured and thus least likely to receive professional psychological services (Doll, 1996). Thomas and Holzer (1999) reported that there is a dearth of appropriately trained clinicians and social workers to provide services to children and adolescents. In many cases, school counselors are the first responders to psychological issues. The Surgeon General's Mental Health Report (U.S. Department of Health and Human Services, 1999) suggests that this shortage places an additional burden on school counselors and other gatekeepers to identify children for screening and treatment decisions. Children and adolescents from historically underserved communities could benefit greatly from public health oriented school counseling programs.

The desperate educational status of African American students in general and young men in particular has received extensive national attention. Dubbed as the "achievement gap," several educators and politicians have allocated a plethora of resources to describe and understand the extent to which African American students score below their White classmates in standardized achievement tests and underperform in classroom indicators of educational attainment (e.g., Fordham & Ogbu, 1986). Yet, there has been far less analysis of how educational outcomes impact the future health of African American adolescents. Few are surprised that the nation's educational underperformers are the nation's most vulnerable to homicide and other crimes, according to statistics from the Office of Juvenile Justice and Delinquent Prevention and Center for Disease Control and Injury Prevention. Yet, there is a dearth of research investigating mental health and academic outcomes for African American males.

The obligation of providing primary education to the next generation has become burdensome by a national misappropriation of resources. There is no doubt that the "achievement gap," if made a priority, could be diminished in U.S. education. Required are bold educational leadership, progressive interventions (prevention), and more accurate indices of educational success, without political intrusion, yet with democratic accountability. Educational leadership requires innovation. Given over 20 years of researching the issue, an expectation of successful strategies is not farfetched. We advocate that education in the United States is past analyses of the problems and should be focused on solutions to address educational inequities in this country (Perry, Steele, & Hilliard, 2003).

The following section describes a school-based, culturally relevant, academic performance intervention—the African American Empowerment Curriculum—that applies African centered psychology (see Hilliard, 1997, for more detail) and social learning theory (Bandura, 1986). As a follow-up to the introductory section, we discuss the roles of the school counselor for advocating prevention interventions in what we call the Progressive School Counseling Model. Then we discuss African American males and school-based interventions and their implications for public health. Next, we outline the African American Empowerment Curriculum and provide preliminary results from an evaluation of its effectiveness, and finally, we provide future directions for culturally responsive school-based prevention interventions. We offer this chapter as an exemplar of school counselors confronting the challenge of developing innovative interventions to promote student success and health.

THE PROGRESSIVE SCHOOL COUNSELING MODEL AND ADVOCACY

Authors have suggested a need for change and transformation of the professional school counselor (Capuzzi, 1998; Erford, 2003). Advocacy for educational achievement by school counselors is an important role in the mission of schools. Because school counselors are often repositories of emotional and behavioral issues influencing learning, we believe advocating for academic achievement without considering students' psycho-emotional needs is unproductive. Academic performance may be impacted when school counselors advocate for fairness and equity in the educational process by developing prevention interventions that meet the needs of all student groups (Baker, 1996; Caldwell & Siwatu, 2003).

The National Standards for School Counseling Programs proposed by the ASCA urges school counselors to be change agents and leaders in school reform (Campbell

& Dahir, 1997). ASCA recommends the following: (1) coordinate comprehensive developmental guidance programs for all students, (2) advocate all students navigate through the school systems for postsecondary school options, (3) call attention to systemic factors that enhance or hinder academic success for all students, (4) utilize achievement data to identify patterns and behaviors that facilitate academic success, and (5) to leadership roles to identify the issues that need to change in the school and help develop change strategies that benefit every student. This call to the profession sets the stage for innovative school interventions by school counselors.

Ethnically and culturally marginalized groups will require interventions unique to their challenges in educational settings. Whether they are socially alienated for being in advanced learning programs (i.e., gifted), are educationally alienated for being placed in special education, or bring an ethnic-based stigma and disposition to the learning environment, these students require psycho-emotional attention that could enhance the learning experience (Caldwell, 2000). As an extension of Gysbers' (1990) Comprehensive School Guidance Model, we offer the Progressive School Counseling Model as a health promotion and risk reduction strategy for school counselors. We acknowledge the many obstacles for schools to effectively meet the mental health needs of students, especially if conducted by nonschool personnel (Doll, 1996; Evans & Weist, 2004). Furthermore, schools with limited resources have fewer options for delivering services to identified students, nonetheless providing screening and prevention. A progressive extension of comprehensive school guidance models is to deliver health promotion and risk reduction interventions through the curriculum for groups of students who demonstrate the highest risk is critical to a adolescent's healthy promotion.

The Progressive School Counseling Model postulates the following:

1. All students are "at-risk"; therefore, prevention interventions are useful for all students.
2. Academic and emotion-focused interventions should be integrated.
3. Education has implications for public health.
4. Worldview commonalities and differences provide opportunities for culturally responsive interventions.
5. Prevention is ecological.
6. Interventions should be informed by culturally competent research.

A progressive school counseling program recognizes its limits in delivering effective services to its students and takes the role of advocate/broker for service providers.

AFRICAN AMERICAN MALES AND EDUCATIONAL INTERVENTIONS

Males of African descent have had a precarious history in the United States. Participation in several social and political institutions was forbidden, with potentially lethal consequences for violation. Space does not permit a detailed account of the historical legacy of "mis-education" (Woodson, 1933) of African Americans in the United States; however, we believe any serious discussion of interventions for African American males must have a historical perspective (Caldwell & White, 2003). We assume that the current status of African American boys in school is influenced by past institutional, family, and community beliefs, attitudes, actions, and reactions (Caldwell, 2000; Saunders, Davis, Williams, & William, 2004).

The statistics describing the current educational and health status of African American males are overwhelming (see the Web sites for the National Institute of Health, the Bureau of Justice, the Office of Juvenile Justice and Detention Programs, and the Centers for Disease Control and Injury Prevention, and the Department of Education). What is even more distressing is that a majority of the commentary generated about this national epidemic has been in the form of critiquing the legislation commonly referred to as the No Child Left Behind Act. Despite debatable gains in the educational status of African American male students following this legislation, there remains the need for a comprehensive school-based intervention strategies.

Some of the challenges to developing school-based interventions for African American males are (1) lack of strength-based and positive research on African American males; (2) overreliance on Eurocentric theory to explain African-centered behaviors, creating different equals deficient interpretations; (3) absence of preservice teaching models to confront racism and stereotypes (Milner, Calwell, & Murray, 2004); (4) reluctance to utilize African American and African educational pedagogy and praxis; (5) exclusion of African American community resources; (6) lack of recognition and healing the historically oppressive educational practices; (7) false accusation that African American communities devalue formal education; (8) reluctance of African American communities to democratically confront educational policies that are not in their best interest; and (9) a lack of knowledge and implementation of African American centered educational theory and research by school administrators. By not confronting these challenges, educational systems and the African American communities have contributed to the invisibility of African American males (Franklin, 2004; Osborne, 1999).

Responding to the call from ASCA, we suggest that school counselors take leadership roles in providing inter-

vention models for African American males. There is little argument that educational outcomes have a strong influence on such life outcome indicators as income, health, mental health, suicide, homicide, substance and alcohol abuse, and risky sexual behavior (Anderson, 2002; Beymer, 1995). For this reason, we argue that culturally responsive, school-based prevention interventions are important to eliminating health disparities among African American males. Mahoney and Merritt (1993) found a higher percentage of African American male students more likely than White students to seek school counseling services to overcome academic weaknesses and for job and educational placement. Positive experiences with interventions disseminated by school counselors may increase the likelihood of African American males later accessing help or at least voluntarily participating in health-focused interventions. We urge that school counselors confront the aforementioned challenges and create culturally responsive interventions that meet the psychosocial, educational and health needs of African American male students.

Culture-centered school-based prevention interventions. Universally applied (etic), school-based intervention may be marginally successful, depending upon the target audience and the content of the intervention; however, school administrations often fear the political fallout of targeted interventions by those who qualify them as "set aside" programs. While gender-specific topics usually meet very little hesitation, ethnic/racial segregation is usually confronted with resistance. School counselors should advocate for opportunities for African American students to navigate through their unique challenges without emotional or social intrusion from those they perceive as antagonists. Empowered school counselors can advocate for interventions that are culturally consistent with a target population. Employing the communication style and pattern, cultural worldview, and method of information dissemination by a target group may render it culturally consistent.

Cicero and Barton (2003) advocated that professional school counselors find ways to collaborate with community service agencies to meet the needs of children and families. Oftentimes, culturally centered interventions are avoided because of limited culturally competent school personnel. In the case of the AAEC, the school counseling staff was proactive in partnering outside of the school district to find a culturally competent facilitator of the intervention. The shortage of African American males in leadership and instructional positions within school districts provide opportunities for creativity. We request that schools no longer hide behind "racial" politics as the excuse to underserve ethnic "minority" groups of students and thus exacerbate their invisibility. Under the leadership of professional counselors, a school can be challenged to find the appropriate resources to address educational and health issues.

African American EMPOWERMENT CURRICULUM

Responding to the districtwide academic underperformance of a majority of African American male students, the counseling staff at a midwestern high school sought an intervention to address the "achievement gap" in their school. Prompted by the shortage of solutions proposed by the school district to address standardized test score discrepancies, the counseling staff, which consisted of three females (an African American, a Latina, and a European-American) and one male (a European American) initiated an intervention that would target African American male students. The African American Empowerment Curriculum was developed as a prevention intervention to address academic motivation and underperformance, and to promote school participation among African American boys.

The school counseling department sought and received a grant from a local funding foundation to pilot the AAEC during the second semester (January to June) of the school year. The mission of the counseling center was to develop a culturally responsive intervention that would address the following issues from their experiences providing services to African American male students: (1) feelings of cultural alienation from the educational process; (2) beliefs that the educational process lacks cultural relevance; (3) "anti-intellectualism," including negative peer pressure for academic participation or commitment; (4) fear of competing in the academic arena as a result of being presented with race/ethnic based stereotypes suggesting the intellectual inferiority of African American males; (5) other forms real or perceived racism; (6) ethnic and cultural identity issues; and (7) victimization and coping issues related to school culture issues. Although several issues were relevant to other student groups (e.g., African American females), it was hypothesized that a culturally consistent intervention would yield the greatest impact.

African-centered educational psychology (see Hilliard 1997; Kunjufu 1995, 2000; Sanyika, 1999) and social cognitive theory (SCT; Bandura, 1986) provided a conceptual framework for this intervention. In particular, African-centered educational psychology posits that African American learning is optimized when the following exist: (1) there are culturally consistent teaching styles; (2) learning is expected to develop character; (3) there are high expectations for high performance and achievement; and (4) learning is holistic (Hale, 2004). In addition, the tri-

adic model of social cognitive theory comprising person, behavior, and environment interaction complimented the African-centered educational psychology framework. For example, individual, person-level factors such as skills, outcome expectancies, and self-efficacy spurned by the African-centered teaching approaches may increase the likelihood of that individual executing a behavior; conversely, individual behaviors can shift group norms among others in a learning environment, which can potentially shift a student's personal motivation (i.e., self-efficacy) and future behavior. Environmental factors (e.g., seating configuration, caller-response teaching method) can either enhance or hinder individual motivation. Reciprocal determinism, the dynamic interaction of the personal factors, environmental factors, and behavior, is a useful conceptual tool for developing interpersonal interventions for African American adolescents (Resnicow, Braithwaite, & Kuo, 1997). However, SCT alone does not provide the cultural context necessary to account for the unique educational history of African American male students.

The Progressive School Counseling Model Applied: African American Empowerment Class. The following describes the AAEC. African American males were randomly selected from a midwest high school population to participate in the AAEC. The selection criteria established by the counseling center staff were (1) schedule clear during the time the class was offered (3rd period) and (2) volunteer to participate. We intentionally did not use grade point averages, attendance records, or records of behavioral history as selection criteria to increase the diversity in performance level, motivation, and disposition toward school. Of the 21 boys invited to participate in the class, 18 volunteered. The reasons of those declining participation are unknown, but of interest. The class met daily during the third period (47 minutes) of the second semester (January to June) every school day as a regular academic course. Because of scheduling conflicts, the principal investigator was absent for 5 of the 65 classes. In addition, the intervention was concluded prior to the summer break because of the first author's overseas teaching obligation that began before the end of the school district's academic year.

African American Empowerment Curriculum (The Intervention) Description

The AAEC was implemented as a culturally consistent intervention for African American males (Akbar, 1998; Caldwell & White, 2001). Students were greeted at the door with a handshake and the classes began with a discussion about expectations. The environment was manipulated by placing the desks in an oval shape, which was different from the line of four rows, so each member could view the others. Students had to address each other by first names and the instructors by their titles. Ground rules were established and are summarized as respecting self, each other, and the class space. In addition, collective accountability was discussed as an expectation to create a sense of group cohesiveness.

Employing the previously mentioned conceptual models and research literature, the AAEC consisted of four conceptual target attitudes and behaviors: (1) cultural consciousness, (2) academic competence, (3) life skills, and (4) social responsibility. The following are descriptions of the conceptual targets:

Cultural consciousness is one's ability to understand his or her ethnic history and how it influences his or her thoughts, actions, and future (Kambon, 1998). Ethnic identity has been demonstrated to influence the learning of African American students (Cunningham & Boykin, 2004). Lesson plans in this domain consisted of the discussion and exercises, which explored identity in ethnicity and masculinity. For example, students were asked to list their images of African American males, discuss where these images come from, and to think critically about the utility of these images on their academic self-concept. Not surprisingly, the students' original list of images could all be characterized as negative. The list included "hustler," "violent," "dumb," "lots of children," "womanizer," and "abusive." These images are consistent with media portrayals and mainstream sentiment. The point of this exercise and this phase of class was to introduce cognitive restructuring and critical thinking. The students were asked to discuss where these images may have come from. In addition, they were asked to write a short paper about how these images could be changed and to what would they be changed. A hip-hop analysis using the song "I know I can" by hip-hop artist Nas was conducted during this section. The class was given the charge of creating the image of the ideal African American male student and then challenged to live up to that image (Akbar, 1998).

Academic competence focused on the influence of the cultural unconsciousness on the development of learning strategies. The aforementioned images exercise led to a discussion about academic performance. The central question extracted from the previous phase was, "Is your academic performance a result of the images you have about African American men?"

Students were presented with academic achievement data for the district and were asked to interpret the data. This experience allowed the students to critically analyze how their self image influenced their academic behavior. The class role-played how to encourage an underperform-

ing classmate who is presenting as low achieving. The class actively discussed such issues as peer underperformance, teacher–student conflicts, deep breathing, and test anxiety. There is scant published research that investigates preventative strategies with African American high school males.

The lyrics and songs from music CD "The Journey," by Dr. Cornel West, were used as stimulus to discuss the legacy of African American intellectualism. Students were then given an assignment to research, using the Internet, African American scholars and inventors.

Life skills were discussed in the context of navigating the school environment. We addressed such behaviors as language, self-presentation, and code-switching. Emotional clarity, management, and expression were stressed. The intent of this phase was to address behavioral and time management. Many of the conduct issues that arose in the school could be classified by teachers as anger management issues. We believed, however, that in some cases, students were provoked or misunderstood by teachers who were impacted by stereotypical images of African American males. Students in the class were prompted, employing rational emotive therapy techniques, to understand their own behavioral reaction to being "played" (disrespected) or embarrassed. For example, in one class, we role-played how to code-switch when an individual perceived that a teacher had "dissed" him. Students were taught that emotions are natural, but that they must be controlled in a manner that was consistent with their ideal image of African American masculinity. Each student was asked to identify how mismanaged emotions led to negative consequences. Code-switching was taught as a life skill, where students mastered their emotional response and then found the appropriate outlet to vent when they believe they had been "dissed." Active learning techniques were used to encourage code-switching. The goal of this section was to engage the students in critical thinking and introspection while introducing such life skills as thought stopping and code-switching to reduce the likelihood of misconduct when emotionally vulnerable.

In addition, career exploration activities were conducted. Guided imagery exercises that promoted dreaming and strategic planning were conducted in class. Students were given an assignment to write down their dreams and a plan to see them accomplished. This required the class members to participate in a realistic self-appraisal of skills, talents, and necessary resources to realize their dreams. Such life skills as time management, study skills, conflict resolution, decision making, and communication of intentions were taught.

Social responsibility is an outcome of an empowering educational process for African American high school students. The class discussed empowerment in the context of creating and managing the ideal African American male image. Being self-sufficient, collaborative, and able to garner resources to address issues that promoted success in their community were central to the class's definition of empowerment.

The students were given an assignment to identify problems in their community that they wanted to fix. The music of hip-hop artist Mos Def was used as a stimulus for addressing the issue of social responsibility. In addition, class participants were tasked with developing a youth focused intervention for African American middle school students. The assignment included completing a Google search with assigned search terms for community and school-based interventions. The objective was to develop an intervention and propose it to the leadership of a local community center historically associated with African American families.

Measuring Culturally Responsive Interventions: Outcome Research

While research is not a major focus of this manuscript, we thought it important to give some insight into how we measured the success of this intervention. Perry (1993) called for professional counselors to understand outcomes research. It is important that consumers of culturally responsive school-based interventions understand outcome research. We advocate that culturally responsive outcome measures be utilized to measure the effectiveness of ethnic specific interventions.

We advocate expanding intervention success indicators beyond behavior and class grade indicators to include attitudes toward learning promoting strategies, learning compromising strategies, and academic self-efficacy. Of particular interest was the concept of academic self-efficacy (e.g., students' self-belief in completing academic tasks) (Multon, Brown, & Lent, 1991). Generally, we hypothesized that students who felt confident in their academic abilities (i.e., high self-efficacy) would perform to their ability and demonstrate fewer learning compromising behaviors. A mixed-method evaluation procedure was implemented to monitor the impact and influence of the course on academic performance.

Because this chapter is not intended to be a research paper, we are providing limited information about the results. A selection of the measures included in the evaluation is provided as a point of reference for future school-based prevention intervention outcome research. Questionnaires were administered to the class participants on the first day of the class, at the midterm, and again at the end of the semester. Feedback from the participants at the 6-month follow-up indicated that the last data collec-

tion (June) was not a good time to collect data because of the students focus on the upcoming summer. In addition, three focus groups were conducted at the beginning of the semester (January), at midsemester (March), and at the conclusion of the semester (June). Below are the titles, brief descriptions, and reliability coefficients for this sample for each instrument:

Academic Self-Efficacy (PATTERNS OF ADAPTIVE LEARNING SCALES (PALS), 2000, p. 24)
Scale Description: This refers to students' perceptions of their competence to complete their class work.
Internal Consistency: .86

Self-Presentation of Low Achievement (PALS, 2000, p. 27)
Scale Description: This refers to students' preferences to keep peers from knowing how well they are achieving in school.
Internal Consistency: .85

Performance-Avoidance Goal Orientation Revised (PALS, 2000, p. 13)
Scale Description: When oriented to performance-avoid goals, students' purposes or goals in an achievement setting is to avoid the demonstration of incompetence. Attention is focused on the self. A performance-avoid goal orientation has been associated with maladaptive patterns of learning.
Internal Consistency: .70

Performance Approach Goal Orientation Scale Revised (PALS, 2000, p. 12)
Scale Description: When oriented to performance-approach goals, students' purposes or goals in an achievement setting is to demonstrate their competence. Attention is focused on the self. A performance-approach orientation has been associated with both adaptive and maladaptive patterns of learning.
Internal Consistency: .90

Mastery Goal Orientation Revised (PALS, 2000, p. 11)
Scale Description: This refers to students' reasons or purposes for engaging in academic behavior. Different goals foster different response patterns. These patterns include cognitive, affective, and behavioral components, which have been characterized as more or less adaptive.
Internal Consistency: .88

Academic Self-Handicapping Strategies (PALS, 2000, p. 22)
Scale Description: This refers to strategies that are used by students so that if subsequent performance is low, those circumstances, rather than lack of ability, will be seen as the cause.
Internal Consistency: .79

Racial Awareness of Achievement Scale (Caldwell, 2003)
Scale Description: This measures race-based attitudes toward academic achievement and tests assumption of race-based anti-intellectualism.
Internal Consistency: .81

Castenell Achievement Motivation Scale (Catenell, 1994)
Scale Description: This assesses how various areas, such as peers, home, and academic influence, affect motivation within the student.
Internal Consistency: .78

Presence of Caring Individual Protective Factors
Scale Description: This measures how much the person feels he has an important person who supports him.
Internal Consistency: .70

Preliminary qualitative results obtained from two focus groups provided statements that indicated positive attitudes and experiences towards the AAEC and a change in motivational attitudes. Preliminary quantitative results from a longitudinal descriptive analysis revealed positive trends in learning promoting behaviors, reduction in learning compromising behaviors, and acquisition of an affirming disposition toward education. Preliminary quantitative results from a descriptive analysis indicated positive trends in all measures. A partial order correlation analysis found significant relationships between *Mastery Goal Orientation* and *Academic Self-Efficacy,* and between *Presence of Caring Individual Protective Factors* and *Academic Self-Efficacy*. These two variables warrant further analysis, as they could be used in future interventions for this population.

Future Directions

The purpose of this chapter was to assert the importance of a public health perspective in the role of school counselors. Because school counselors have a relatively captive audience, they are positioned as conduits for prevention interventions and health promotion. Recognizing the realities of school districts across the country (i.e., shrinking financial resources, legislative pressure to increase standardized test scores, and personnel shortages), we advocate that school

counselors create progressive school counseling models that extend comprehensive guidance models by targeting proven risk and protective factors through the curriculum. In addition, we wanted to call attention to the need for culturally consistent school-based interventions that address the needs of underserved students and families. Although the focus of this chapter was not empirical research, we provided an example of an evaluation method and preliminary results.

The African American Empowerment Class demonstrates the importance of a progressive school counseling model for the provision of culturally consistent school-based prevention interventions. School counselors are positioned to advocate for underserved and marginalized students. Despite the abundance of national attention given to the "achievement gap," the literature is scant regarding interventions. There is even a larger void in research that investigates the associations between academic performance and psychological variables (e.g., wellness, distress, anxiety). Culturally relevant strength-based research concerning African Americans adolescents is noticeably missing from the literature. We hope that this chapter can initiate more dialogue that includes school counselors who play a vital part in the health of school-aged students. By proactively addressing the needs of underserved students—for example, African American males—school counseling departments may be able to increase academic performance and promote healthy attitudes and lifestyles for high-risk students. Curriculum-based interventions models are effective ways for school counselors to engage in disseminating educational and health interventions (Borders & Drury, 1992; Gysbers & Henderson, 2000).

Furthermore, we call for more interventions and research that provide faculty and staff with the skills and tools necessary to increase the learning competencies, academic self-efficacy, and general wellness of African American male students. The current teacher training and counselor education models inadequately prepare school personnel to provide services to students and families who are socially marginalized or economically disadvantaged. We suggest school counseling professionals and training programs create a discourse and training models to address the needs of students whose families have been historically underserved.

The progressive school counseling model asserts that the integration of academic underperformance and socioemotional interventions in a culturally consistent method should be included in the range of intervention options. Progressive interactions are proactive, culturally consistent, and employ community resources (Caldwell, 2001). Professional school counselors who employ this model must be multiculturally competent and community savvy to be effective. We believe that this model can be applied to a variety of marginalized students and families.

In conclusion, we advocate for a modification in school counseling language. For example, we refer to both the student and family in our interventions. This ecological perspective provides us with multiple points of intervention and acknowledges the complexity of student services. Also, we choose the term *academic performance* as opposed to *academic achievement* in our intervention because we believe that school counselors can encourage resiliency, instill hope, and help students navigate educational institutions, thus affecting their performance. We make the distinction of achievement as being a function of scores on a test which has been politicized, is culturally encapsulating, and does not adequately differentiate between external and internal influences. Professional school counselors engaged in progressive school counseling models are integral to providing leadership for accurately representing the educational potential and, ultimately, the health of historically underserved ethnic students and families in their schools.

Student Development

XV
FACILITATING PERSONAL AND SOCIAL DEVELOPMENT

NANCY BODENHORN
Virginia Tech

The *American School Counselor Association* (*ASCA*) *National Standards*, and most school counseling programs, indicate provision of student development in three areas: (a) personal/social, (b) career, and (c) academic. One of the suppositions of this chapter is that the differentiation between these areas of development is somewhat artificial. In other words, if an area of the school counseling program is ostensibly geared to personal/social development, this will also affect students' career and academic development. The Collaboration for Academic, Social, and Emotional Learning (CASEL; http://www.casel.org) provides updated research on the synergy between these areas of student development. For planning, programmatic, and accountability reasons, it can be helpful to differentiate these areas, but from a holistic point of view, student development in these areas is intertwined.

That being said, this chapter will focus on those programs that are primarily geared to personal/social development.

> Personal/social development includes the acquisition of skills, attitudes, and knowledge that help students understand and respect self and others, acquire effective interpersonal skills, understand safety and survival skills, and develop into contributing members of society. Personal/social development standards and competencies ensure that students have learned to negotiate their way successfully and safely in the increasingly complex and diverse world of the twenty-first century. (Baker & Gerler, 2004, p. 380)

More than any other area of the school counseling program, the responsibility for personal/social development is in the realm of the entire school staff. Indeed, some of the programs described later in the chapter indicate that the whole staff, including custodians, bus drivers, and cafeteria workers as well as teachers and administrators, need to be trained in order to fully support students. Needless to say, parents and families are essential in their students' personal/social development. School counselors frequently serve as consultants for parents and families who may struggle with facilitating development in this area.

The themes of the *ASCA National Model* (advocacy, leadership, collaboration, and systemic change) are productive lenses through which to view personal/social development in the schools. Collaboration is needed with all constituents of the school and community. Schools showing the most success in personal/social development have been those in which comprehensive guidance programs are more thoroughly implemented (Lapan, Gysbers, & Petroski, 2001), schools with integrated prevention programs across grade levels and courses, and schools that work systematically to establish a community where personal/social learning is integrated with academic learning (Elias, Hunter, & Kress, 2001). Advocacy, leadership, and commitment to systemic change to implement programs with children's holistic development at the core are needed to ensure that the personal/social realm is included in schoolwide efforts.

Personal/social development is supported in a variety of ways in the schools. The programmatic avenues that will be covered in this chapter include character education, moral development, emotional intelligence, self-efficacy, self-esteem and other-esteem, decision making, and assertiveness. Anger management, conflict resolution, and goal setting are not included here, though they are considered areas of personal/social development, because they are covered in other chapters.

Theory

Character Education

According to the ASCA (2005) position statement on character education,

> Inclusion of character education in the school curriculum helps students acquire the knowledge, skills and positive attitudes necessary for student achievement and success in life. The professional school counselor understands that the acquisition of positive character values promotes healthy student development. These universal values include such traits as honesty, integrity, trustworthiness, respect, responsibility, fairness, caring and citizenship, which all affirm basic human worth and dignity and support healthy communities. Character education emphasizes key social values and encourages students to become responsible, contributing members of society. (¶ 2)

Character education has sometimes come under criticism based on a misperception that schools are selecting and endorsing specific values that do not represent all populations, undermining or overstepping families as the primary purveyors of ethics and values. Some critics indicate that this is the purview of families and religious organizations, rather than of schools. The values espoused in character education programs, however, are basic to student development in a pluralistic classroom and society, and they are not contradictory to behavioral values espoused by parents or religions (Lickona, 1991).

Many states currently mandate that character education be included in the school curriculum. The coordination and selection of the program frequently falls within the school counseling program development. This responsibility is endorsed by ASCA.

Good character is conceptualized in three domains: (a) moral knowing, (b) moral feeling, and (c) moral action. The three domains interact and build on each other as we develop.

- Moral knowing incorporates moral awareness (recognizing that an issue may be considered right or wrong), knowing moral values (values to which one's society, family, and/or culture ascribe), perspective taking (ability to take another person's viewpoint), moral reasoning (understanding why being moral is important and understanding how to be moral), decision making (ability to think through a moral problem), and self-knowledge.
- Moral feeling incorporates conscience (knowing what is right and feeling an obligation to do what is right), self-esteem, empathy (emotional perspective taking, identifying with another person), loving the good (taking pleasure in doing good), self-control, and humility.
- Moral action incorporates competence (ability to turn moral judgment and feeling into effective action), will (acting on hard choices), and habit (developed through frequent practice). To create a school environment that encourages character development based on respect and responsibility, the school, parents, and community must develop a partnership of commitment; a positive moral climate must be created in the school; and caring must be expanded beyond the classroom (Lickona, 1991).

Moral Development

Moral development can overlap with character education, but there are specific theories of moral development that are important to understand and that inform the practices of school counseling. Kohlberg (1969) outlined six stages of moral judgment based on his research. His research has come under some criticism, partly because his subjects were exclusively male, and other researchers have added a responsiveness or care dimension to Kohlberg's stages as a "different voice" in moral development (Gilligan, 1982).

Kohlberg's (1969) stages of moral development include six stages in three levels. When people are in level 1, Preconventional, their moral values are externally based. Within this level, stage 1 is earmarked by recognizing whether a behavior is rewarded or punished and then acting out of personal concern to avoid punishment. During stage 2, people begin to recognize that others are affected, but the main rationale behind choosing an action is based on whether the action will benefit the self in some way. The hallmark for this stage is, "What is in it for me?" When people are in level 2, Conventional, they extend their understanding of reciprocal relationships. Within this level, people in stage 3 are motivated by desire for approval and acceptance, so they tend to conform to group norms. During stage 4, people begin to consider a broader scope of society, but rely on laws, rules, social order, and duty as their guidelines for behavior. When people are in level 3, Postconventional, they begin to utilize principles to determine their actions. During stage 5, societal and legal contracts are differentiated from legal absolutes, and judgments can be made based on the greatest good for the greatest number and the concept of cooperative collaboration.

Stage 6, apparently rarely reached, is earmarked by utilizing universal ethical principles that would be applicable for all people in all cultures at all times (Kohlberg; Newman & Newman, 1995; Paisley & Hubbard, 1994).

More recently, theorists have reconfigured moral development into three schemas (Rest, Narvaez, Bebeau, & Thoma, 1999; Rest, Narvaez, Thoma, & Bebeau, 2000). As opposed to stages, the schemas are conceptualized as changes in frequency of usage, understanding that development occurs at a variety of rates. Rest et al. (2000) also acknowledged that cross-cultural similarities and differences remain as and raise questions in morality, rather than presenting morality as a universal concept. The reconfiguration is named a neo-Kohlbergian approach, as the basis of Kohlberg's theory remains.

Rest et al. (1999, 2000) indicated that elementary children are in the Personal Interests Schema, which corresponds to Kohlberg's stages 2 and 3. Adolescents begin to recognize societal needs and they begin to think in terms of "macromorality." Macromorality, as opposed to earlier micromorality, situates moral resolutions in the context of what is good for the greater good beyond self, family, and friends, and it wrestles with the questions of how to organize a network of cooperation on a societywide basis and on issues of social justice. When these issues can be cognitively dealt with, people move into the Maintaining Norms Schema, which corresponds to Kohlberg's stage 4. According to this schema, law and order are critical to organizing societies, respect for the social system is demonstrated by obeying authority, and maintaining the social order defines morality. Entering into adulthood, people start to utilize a Postconventional Schema, corresponding to Kohlberg's stages 5 and 6. According to this schema, moral obligations are to be based on shared ideals, are fully reciprocal, and are open to scrutiny. Shared ideals are not mandated, but they need to be recognized, acknowledged, and justifiable. Laws, roles, codes, and contracts are recognized as social arrangements that can be successfully designed in a variety of ways, and thus, they can be changed.

Understanding students' developmental levels and ability to conceptualize society is important for school counselors. We work directly with students on moral development issues, both one-on-one, in small groups, and in classroom guidance lessons. We also consult with teachers and parents who interact with students as they develop their moral identities.

Emotional Intelligence

The most comprehensive definition of emotional intelligence (EI) is

> the ability to perceive accurately, appraise, and express emotion; the ability to access and/or generate feelings when they facilitate thought; the ability to understand emotion and emotional knowledge; and the ability to regulate emotions to promote emotional and intellectual growth. (Mayer & Salovey, 1997, p. 10)

Thus, EI relates to both our self-knowledge and knowledge of others' emotions and emotional expressions, as well as to the regulation of our own emotions.

EI is directly related to many of the prevention education programs targeting drugs, sex, anger, and relationships. These programs, in general, may include lessons on identifying feelings, reacting to and managing feelings, and making decisions based on a variety of factors, not solely on emotions (Ciarrochi, Forgas, & Mayer, 2001; Goleman, 1994). Rational Emotive Behavior Therapy (REBT) counseling, frequently used with adolescents, is also dependent on the skills of Emotional Intelligence.

Self-Efficacy, Self-Esteem, and Other-Esteem

Self-efficacy is one of the cornerstones of social cognitive theory. Self-efficacy is defined as "beliefs in one's capabilities to organize and execute the courses of action required to manage prospective situations. Efficacy beliefs influence how people think, feel, motivate themselves, and act" (Bandura, 1995, p. 2). Each of us has a sense of our efficacy in particular areas of our lives, so one may have a sense of high self-efficacy regarding math, but low self-efficacy regarding basketball.

Self-efficacy is differentiated from self-esteem in that self-efficacy is derived from accomplishments and is specific to areas of activity, whereas self-esteem is a global sense of self-worth derived from messages of love, support, admiration, and approval (Newman & Newman, 1995). School counseling programs and educators seem to be shifting their focus from developing student self-esteem to developing student self-efficacy as the standards-based movement takes hold. These concepts are certainly intertwined and can build upon each other, but people may have a high level of self-efficacy (especially when limited to one particular area of accomplishment) and not have a high level of self-esteem, and vice versa.

Other-esteem is not seen widely in the literature, but it is a reaction to previous focus on developing self-esteem. Other-esteem serves as a reminder that we need to balance self-worth with recognizing and respecting the worth of others as well. Multiculturalism, prejudice reduction, antibullying, conflict resolution, and peer helper programs are all based on the need for increased other-esteem.

Decision Making

Decision-making skills are a major part of the *ASCA National Standards* in all of the three components. Students make daily decisions regarding their academic and career choices, as well as their personal/social choices. Teaching a decision-making model of identifying options; listing potential positive and negative consequences; and choosing, acting, and evaluating the decision has probably been included in school counseling programs since their inception. Decision making is, similar to EI, commonly included in prevention education programs.

Assertiveness

Assertiveness incorporates self-advocacy and independent communication. Children and adolescents frequently need training and practice in how to ask for support in productive ways. Self-advocacy skills include being able to identify one's needs through self-knowledge and to recognize that one's personal needs also have an impact on others. Communication skills are then built upon recognizing others' needs as well as one's own and asking persistently for solutions to meet ones own needs without infringing on the needs of others. Counselors frequently provide role modeling, role-play practice, and support for students in developing these skills.

Research

The school counseling profession has historically been weak in producing outcome research, so research findings on programs that serve to develop personal/social competence stem from a variety of sources.

Character Education

Character education is an area that, while widely implemented in schools nationwide, has not been widely researched in comparative studies. Additionally, most character education programs are developed to be used by all school staff members, primarily delivered by classroom teachers, rather than necessarily using a school counselor. SUNY Cortland's Center for the Fourth and Fifth R's (n.d.) Web site listed 43 programs or organizations that deal with character education, and more are devoted specifically to bullying or violence prevention that overlap significantly with character education programs. These programs and organizations may change over time, so updated information is best found on the Internet. Research on particular programs can be difficult to evaluate for objectiveness. School systems that choose to purchase any given program are invested in obtaining positive results, as are the organizations that produce the programs.

Developing or utilizing a character education program comprehensively is undoubtedly better than either doing nothing or patching a program together nonsequentially and nontheoretically. At this point in time, however, research has not identified one program as the most superior when compared with others. One study based on longitudinal (three-year) data of five systems in one state that implemented different programs found a significant increase in indicators of school climate in all systems implementing a program. Recommendations are made to match the program characteristics to aspects of the community, but evaluators were not able to identify differences between the programs utilized (Skaggs & Bodenhorn, 2006). One very well-designed study utilized one group of schools that did not receive any character education program and another group of schools that implemented the Second Step program (Committee for Children, 2007) in second and third grades. Researchers, who relied on trained behavior coders who did not know which students had received the program and which had not, found significant differences in aggressive behaviors and prosocial skills that remained over a 6-month period after the program was initiated (Grossman et al., 1997). Similarly, *Character Counts!* (Josephson Institute of Ethics, n.d.) includes a variety of studies and anecdotal evaluations that include indications that the program increases academic achievement and lowers disruptive behaviors, including cheating, vandalism, absenteeism, racial incidents, fights, and discipline referrals. While these studies identify one particular program, the results indicate that the program is better than no program, not that it is better than another particular program.

Research on character education programs will, I hope, continue to grow. Some of the continual challenges to research in this area are measuring and attributing the outcomes. A variety of efforts are made throughout the community to develop children's character. The types of measurements that are currently used to assess character education are either behavioral (i.e., changes in discipline, aggression) or attitudinal in terms of safety and comfort in school (school climate). These are expected behaviors related to an increase in the values espoused in character education programs, but are really a by-product of character development.

Moral Development

Simplified categorizations of approaches to moral development are as "direct" and "indirect." Direct approaches rely on presenting role models, telling stories with heroes and heroines who exhibit moral characteristics, studying various virtues, and providing opportunities to rea-

son through moral dilemmas. Indirect approaches rely on holding class meetings, presenting opportunities for perspective taking and role-taking, using literature to stimulate discussions, and exhibiting a commitment to increase the level of student autonomy. A more comprehensive way to understand approaches to moral education, and a reasonable way for school counselors to evaluate or design programs for moral development, is to understand the psychological, moral, and educational assumptions behind the approach and to identify the contingent factors involved or assumed (Sanger & Osguthorpe, 2005). Similar to a counselor's identifying a counseling theory that works best for that counselor and a particular setting, identifying an approach to moral education can be dependent on the belief systems and characteristics within the school.

Situations arise on a regular basis in schools that involve student moral development. All school staff intervene with children if they are behaving in ways that would be considered morally inappropriate (e.g., bullying, fighting, ridiculing, ostracizing). Ideally, programs are in place to prevent this type of inappropriate behavior.

Creating cognitive dissonance is necessary to provoke someone developmentally (Piaget, as cited in Paisley & Hubbard, 1994). Dissonance is achieved when thoughts, feelings, and behaviors are not balanced, and it is stimulated by interaction with the social environment, especially with peers, when conflicts arise. Many situations present opportunities to discuss moral decisions, including children's books related to moral issues; situations that have occurred and are presented in various disciplines, such as history, literature, or science; hypothetical but believable dilemmas; spontaneous experiences that occur in everyday life; and simulations such as a "blue-eyed/brown-eyed" oppression experience (Maslovaty, 2000). With any of these open-ended stimulants, a dilemma discussion can be developed for students to contemplate and convey their own reasoning about decision making in challenging situations.

Counselors are advised to recognize the various cognitive and moral developmental stages. Using plus-one reasoning, discussions should be geared to the current developmental level and one above. Students are able to understand their own level and those developmentally below them, but are only able to grapple with issues represented within one step above their level. Students are overwhelmed and frustrated with discussions that are too far above their developmental level (Paisley & Hubbard, 1994).

Emotional Intelligence

Emotional intelligence is conceptualized as three different skills: (a) recognizing our own emotions, (b) recognizing others' emotions, and (c) managing our emotions.

Recognizing our own emotions is a basis of person-centered therapy, wherein the counselor reflects emotions indicated either directly or indirectly. All counselors have developed the skills to be able to support children in identifying and recognizing their emotions.

Recognizing others' emotions is similar to the trait of empathy. Research on empathy development leads us to the ambiguous generalization that empathy can probably be learned within limitations of age, maturity, and experience (Duan, Rose, & Kraatz, 2002). The key ingredients to empathy development seem to be role- and perspective-taking (Duan et al., 2002). One activity that uses role-taking is theater. Kruger, Samuelson, Kapsch, Flanigan, and Harris (2003) presented results of a pre-post study with 111 middle school students experiencing an actor-in-residence over a 2-year period. The control group empathy scores decreased, while the intervention group's increased. For this group, the experience of exploring others' perspectives through the dramatic arts increased the component skills of empathy in a measurable way. Similarly, volunteer service is advocated for students at all levels, starting in preschool. Contributory service has resulted in increased empathy as well as valuing everyone's contributions (Elias et al., 2001).

Managing emotions is a basis of the various forms of cognitive–behavioral therapy, wherein the counselor helps students balance their feelings and behaviors in avenues that will avert problems.

Emotional intelligence correlates positively with life satisfaction, ability to maintain self-esteem and positive mood in a negative situation, ability to maximize the impact of positive mood, interpersonal relationship quality, academic success, occupational success, and leadership effectiveness (Ciarrochi et al., 2001). Additionally, EI moderates the effects of stress on mental health. In other words, those people with high emotional intelligence who experience stress experience fewer mental health problems than those with low emotional intelligence do under the same stress (Ciarrochi, Deane, & Anderson, 2002).

Self-Efficacy, Self-Esteem, and Other-Esteem

Self-efficacy contributes to resiliency, perseverance, positive risk-taking, and lower anxiety levels. Self-efficacy is learned through direct mastery experiences, through vicarious experiences of watching others (role models), and through persuasion or encouragement (Bandura, 1995). Fall and McLeod (2001) developed a self-efficacy scale for student learning. Identifying students with low self-efficacy can help counselors and teachers understand student behavior and provide appropriate interventions.

Self-esteem is also related to resiliency, positive risk-taking, optimism, and social relationships. Self-esteem is enhanced through a sense of belongingness, continuity

of values and experiences, and relationships with at least one person who extends unconditional positive regard, as well as through reinforcement of skill areas (Newman & Newman, 1995). Outcome research on elementary school programs designed to enhance self-esteem has found no consistent results regarding self-esteem, but it did find an impact on achievement (Whiston & Sexton, 1998).

Research specific to other-esteem in the form of prejudice reduction is also scarce. One study reported positive findings for a program with fourth graders receiving a 1-week group guidance session. Students who received the program exhibited more cooperative social skills than those who did not receive the program (Omizo & D'Andrea, 1995). Similar to findings with character education and comprehensive guidance programs, the success of antibullying and respect programs seems to be reliant on the commitment of the entire school staff to interact with students exhibiting antisocial behavior.

Decision Making and Assertiveness

Little research has been conducted specific to these areas of practice. Social skills training in general, which can incorporate decision making and assertive communication, was an area that showed a trend of positive results, according to a review of school counseling outcome research (Whiston & Sexton, 1998).

Practice

This section is divided into two parts. The first part focuses on the different roles that school counselors perform at different academic levels in the realm of personal and social development. The second part focuses on some sample resources and programs that can be utilized to guide practice.

Elementary School

Elementary school counselors, according to comprehensive guidance program suggested guidelines, spend between 35 and 45% of their time delivering guidance lessons in a classroom setting. School counselors should advocate for a developmentally appropriate, theoretically sound, research-based program suitable to their school setting. Character education, moral education, and emotional intelligence programs frequently organized into 30 to 45 minute lesson plans are widely available, but can be expensive for cash-strapped school systems. Individually developed lessons can be effective and valuable, but not as effective as comprehensive programs that are integrated into the school culture.

Many elementary school counselors also offer small group sesssions for students with particular developmental needs (e.g., students whose parents are divorcing). These offer understanding, skill-building opportunities, and socialization for children who need particular support in areas either where their circumstances are special or where they may lag behind their peers. Group counseling was found to be especially effective for elementary students (Prout & Prout, 1998; Whiston & Sexton, 1998).

Individual counseling is an appropriate practice for processing situations that occur in schools. Some elementary school children need the focus and attention offered only in individual meetings. Counselors need to use good judgment to not spend too much time in individual sessions, to the detriment of all the other students in the school.

Consultation is critical to the development of a school counseling program in elementary schools. Elementary school counselors perceive their role in school–community partnerships as being more important to their school than secondary school counselors do (Bryan & Holcomb-McCoy, 2004). Elementary counselors have more contact with and provide more consultation for families and teachers than secondary counselors do (Isaacs & Stone, 1999). Keys, Bemak, Carpenter, and King-Sears (1998) advocated for a collaborative consultation model for counselors to work with families, teachers, and community providers. The collaborative consultation model is based on the parity of team members, mutual goals, interdependence of support, and shared responsibility, resources and accountability. This type of support, especially for at-risk children, could be instrumental in providing continuity and stability for children.

Middle School

Middle school counselors need to be masters of transition. Not only do they oversee the students' transition from elementary to middle and then on to high schools, but adolescence itself is a time of personal and physical transitions.

Many middle school counselors are instrumental in building communities that support the transitions their students' experience. A variety of programs that essentially establish smaller communities within the school have proven to be beneficial (Akos & Galassi, 2004; Lawson, McClain, Matlock-Hetzel, Duffy, & Urbanovski, 1997; Myrick, 1997). Overseeing these programs and/or providing activities or guidelines for the small community meetings to support emotional development are frequently the responsibility of the school counselor. These communities (perhaps established as teacher-advisory or school-within-school) can provide support similar to the elementary classroom guidance, utilizing many staff members as facilitators.

Consultation and training with staff is therefore critical in developing these programs.

Small group sessions are also frequently held in middle schools. Some counselors find groups especially beneficial for adolescents, who are frequently hyper-aware of peer reactions, status, and pressures. Through the group interaction process, they learn how to interact appropriately, if the group is well-constructed, with some role models and students at slightly different levels of development so that students are exposed to the plus-one reasoning described earlier (Brown & Trusty, 2005; Paisley & Hubbard, 1994).

High School

Some high school counselors indicate that because they are so involved in the academic and career aspects of student development, the personal/social aspects get less attention. It is important to remember the interaction of holistic development. College and career choices, as well as academic achievement, are intertwined with personal values, decision-making, self-efficacy, interpersonal relations, and goals. Students are best served by counselors who work from a holistic framework and support the student in balancing these various aspects of their development.

Coordinating small group meetings can be more difficult in high schools, where students are in different class sections and teachers may be very protective of their class time. More time is usually spent in individual planning sessions. Gysbers and Henderson (1994) have recommended that high school counselors spend between 25 and 35% of their time with this avenue of delivery.

Consultation with families of high school students is a complex practice. Families are still very important support systems for most students, but adolescents want, need, and deserve more autonomy and independence as they mature. The most common and most challenging ethical dilemmas reported by school counselors are situations involving confidentiality of student personal issues (Bodenhorn, 2006), which would most likely occur in counseling sessions involving personal and social issues. Consultation with parents of adolescents with whom the counselor holds personal confidences is challenging because the counselor needs to balance the team building process with family supporters and the confidentiality needs of the student.

Identifying Programs

School counselors should ideally be at the forefront of deciding what program will best fit in their particular school and community, as well as the implementation, follow-through, and evaluation of the program. As indicated from some of the research described above, the context of the community is important to implementation decisions. School counselors know their community, the values and norms of their community, and the developmental needs of the students in the community. School counselors may need to adapt a program to their particular community. For example, cultures vary in the value placed on assertiveness, expression of emotion, and independence. If a particular skill is not likely to be valued in the community, some of the lessons in these areas might best be downplayed.

Several agencies provide ratings and evaluations of programs designed to target personal/social development. The titles, descriptions, marketing, and evaluation of the programs included may be specific to one domain of personal/social development. Personal/social development can impact academic development; therefore, the various domains of personal/social development are not easily separated. Drug and violence prevention programs include many aspects of emotional intelligence, moral development, other-esteem, and decision making. Because of the overlap between personal/social development and drug and violence prevention, the agencies that evaluate programs specific to these prevention efforts are included. Due to the constant improvement and development of educational programs, school counselors are advised to check the following Web sites for updated information evaluating related programs when selecting programs to use in their schools. Based on the rigorous research requirements used by these agencies, comprehensive programs have an advantage in the evaluation process. While these programs are undoubtedly more effective, they are also significantly more expensive to implement. School counselors may advocate for the model programs endorsed by these agencies, but realistically need to be prepared to creatively develop and adapt programs and curricula for their schools.

1. www.casel.org. The Collaborative for Academic, Social, and Emotional Learning delineates five developmental areas: (a) self-awareness, (b) social awareness, (c) self-management, (d) relationship skills, and (e) responsible decision making. For each of these areas, the site offers an evaluation of each program covered (currently 80, with 22 indicated as "select"). This site also includes a general indication of the cost of the program and the level of support provided.
2. www.modelprograms.samhsa.gov. The Substance Abuse and Mental Health Services Administration provides a database of programs with information regarding target population, strategies, outcomes, and approximate costs. Currently, 67 programs are included in their model program selection.
3. http://www.nida.nih.gov/Prevention/Prevopen.html. The National Institute on Drug Abuse currently

includes information about 10 programs that address 14 principles of prevention. The principles identified are common to resiliency and personal/social development.

4. http://www.colorado.edu/cspv/blueprints/index.html. With support from the Office of Juvenile Justice and Delinquency Prevention, the Center for the Study and Prevention of Violence provides an evaluation of programs geared to preventing violence. This site currently designates 11 programs as "model," and an additional 16 as "promising."

The programs described in the next section are not meant to be an endorsement of these particular programs, but instead to serve as a guide to what implementing these and similar programs may involve for the school counselor. Each of the programs included is evaluated positively by at least one of the previously mentioned agencies.

I Can Problem Solve (ICPS)

ICPS (Shure, 2001) is a series of three books with lessons focused on resolving conflicts and preventing antisocial behavior for different elementary levels: (a) preschool, (b) primary, and (c) intermediate elementary. Each book contains a series of lessons designed to teach children how to think about problems. The lessons involve games, stories, puppets, and role play. Each lesson contains a script and reproducible materials. The author has also developed a parent involvement component: *Raising a Thinking Child Workbook*. Training and consultation are provided, but the books are sold independently and could be used by an elementary school counselor in classroom guidance lessons.

Promoting Alternative Thinking Strategies (PATHS)

PATHS (Kusche & Greenberg, 1994) is a curriculum for kindergarten through sixth grade geared to violence prevention. The areas of development targeted in this program include self-control, emotional awareness, self-esteem, and interpersonal problem solving. The curriculum is designed for classroom teacher delivery of 20-minute lessons three times per week, so school counselors can either be consultants for the teachers or participate in the delivery. Parent involvement, encouraged through letters, handouts, and activities, provides many avenues for school counselors to integrate the PATHS lessons into the school counseling program.

Training in program implementation is optional, but recommended. Training can be completed on-site, either with an entire staff or by a process of training trainers who then train the remaining staff. The school counselor would likely be one of the trainers, although there may be advantages to having others who are less familiar with the original concepts have the most direct training. The school counselor should monitor the integrity of the training delivered to other staff, even if not directly involved, and serve as a resource for any staff member who has difficulty implementing the expected communication skills or lesson material. If a school were to purchase the program but not the training, the school counselor would be the logical person to implement the program and train the teachers as necessary, based on the specialty education earned in school counselor master's programs.

Second Step

Second Step was developed by the Committee for Children (2007; http://www.cfchildren.org/programs/ssp/overview/). Although Second Step is identified as a violence and bullying prevention program for grades pre-K through 9, the focus of the program includes familiar personal/social skills of empathy, anger management, impulse control, and problem solving. Second Step, named to recognize that families are the first step in social skill building and schools are the second, provides parent workshops during which parents learn and practice the communication skills their children are learning, as well as how to reinforce the skills at home. Materials are provided for teachers of each grade and subject level to infuse the message of respect in all learning areas. Either training is offered for the on-site staff, or a few staff members are trained as trainers for the rest of the staff.

Tribes TLC®

Tribes TLC®, developed by CenterSource Systems (n.d.; www.tribes.com), is designed for grades K–12. The goal of the program is to increase respect for differences, self-efficacy, and belongingness through developing a positive classroom and school environment. Group work and collaborative learning are critical to developing this environment, which involves empathy, active listening, goal setting, and conflict resolution. Teachers learn about the stages of group development and select strategies appropriate to the developmental stage of long-term cooperative learning groups (called "tribes"). School counselors, with background and training in group dynamics, would be natural leaders and/or consultants in implementing this program.

Future Directions

School counselors, through their leadership and advocacy, need to keep personal/social developmental issues within the mission of their schools. Education has a history of

following trends, and the current trend is for standards and high-stakes testing. It is easy for personal/social issues to be set aside in this climate. It is our responsibility to keep holistic development, meaning all three areas of the *ASCA National Standards*, central to the educational process.

Clearly, we also need to activate more research with school counselor involvement in all areas of development, especially personal/social. It is disturbing that none of the major studies describing character education and moral development within the schools referred to utilizing the skills of the school counselor. Of the three developmental areas, personal/social development may be the most difficult to assess because it is hard to quantify. Accountability is a major component of a school counseling program, according to the *ASCA National Model*. As a profession, we need to be able to indicate the impact that our programs have on student development. Sadly, school counselor positions are still in jeopardy in some school systems based on funding and budgets. Until we prove, through research, that our programs are essential to student development, we will continue to be in jeopardy, which means that the students we serve are in jeopardy of losing our skills of supporting personal/social development.

XVI
PHYSICAL HEALTH AND EMOTIONAL DEVELOPMENT: A Primer for School Counselors

LAURA FILLINGAME KNUDTSON AND HARDIN L. K. COLEMAN
University of Wisconsin–Madison

Most of the time, when we imagine the typical child, we visualize a happy, energetic, giggly, innocent small person who craves new knowledge, who yearns for adult attention, and whose mind encompasses an imagination full of colorful, new ideas. We also envision the average child to be physically healthy. This assumption is not unwarranted due to the fact that the majority of children and adolescents are in good to excellent physical health (Centers for Disease Control and Prevention [CDC], 2004b). In addition, the majority of the physical conditions that impact children/adolescents during childhood are illnesses (or death) that could have been prevented (CDC, 2004b). Therefore, when discussing child and adolescent physical health, the prevention of childhood illnesses should be the primary focus. School counselors, as prevention specialists, have a unique opportunity to engage in this conversation. This chapter presents a brief overview of the physical health conditions that impact child/adolescent emotional development. This chapter is not intended to be a comprehensive literature review on any of the key areas, nor is it a medically based guide describing condition diagnosis. Instead, it is intended to serve as a primer (1) to help school counselors and other educators attain a basic understanding of how physical health issues affect students within a school context, (2) to present school counselors with knowledge that can inform community-based referrals for students, and (3) to provide a brief review of how school counselors and other educators can implement interventions in their schools to promote child/adolescent physical health.

The majority of American children live to see their 18th birthdays (CDC, 2004b); however, many children and adolescents encounter significant health conditions that occasionally result in death. According to the National Vital Statistics Report (CDC, 2004b) the top cause of mortality in children and adolescents ages 5 through 19 is accidents (e.g., automobile accident or drowning). Additionally, the next two causes of mortality in adolescents ages 15 through 19 are homicide and suicide (suicide is also the number 3 cause of death in children ages 10 through 14). For younger children (ages 5 through 14), malignant neoplasms (cancers) and congenital malformations, deformations, and chromosomal abnormalities are also significant causes of death. Based on these statistics, it is apparent that many deaths (those due to accidents, homicide, and suicide) are preventable.

When looking at the physical health of America's youth, there are many disparities between the health status of racial/ethnic minorities and European Americans, and between the health of the working class and the middle/upper class in this country. These disparities are reflected in the prevalence of diseases such as asthma and obesity and in other health disparities between wealthy European Americans and other Americans such as the adolescent pregnancy/birth rate. Additionally, there are large inequalities in health care access and quality that are tied to the higher prevalence of disorders in some racial/ethnic minority and working-class populations. It is particularly important for school counselors and educators to recognize the racial and class impacts upon child and adolescent physical health.

The Importance of Prevention in Child and Adolescent Physical Health

Due to the fact that the majority of children and adolescents are very healthy and the majority of physical conditions that affect children are preventable, the importance of preventive care for children and adolescents is obvious.

One of the most encouraged elements of preventive care for children are periodic "well child" visits to a physician. These visits may include elements such as immunizations, sports-participation physicals, and child/family counseling regarding child health issues such as nutrition, adolescent sexual health, and home gun safety. In the end, however, physicians have only limited time with children and families during these visits, and occasionally, critical issues are not covered. Therefore, other members of children's and adolescents' communities can be important contributors to child/adolescent preventive care. Schools provide an ideal context in which to be involved with child/adolescent preventive physical health care due to their frequent and continuous contact with children and their families. In a survey conducted with directors and adolescent health coordinators of the Maternal and Child Health Bureau, respondents identified four suggestions as to what could be done to improve youth health outcomes. Three of these suggestions mentioned the involvement of schools, including (1) integrating physical health, mental health, and school-based health services for youth; (2) strengthening community and school-based health services; and (3) strengthening schools overall (Blum, 1998). Schools are seen by the health community as integral to the promotion of healthy youth in this country, and they are ideal locations for child/adolescent health prevention efforts.

Why are schools important resources for impacting adolescent physical health and emotional development? First of all, schools have a continual and concentrated access to youth and are able to impart information upon children at developmentally appropriate times. Additionally, schools have the opportunity to implement school-wide health programs that become an integral part of children's and adolescents' time at school. Finally, the development of healthy children has long been a mission of American schools (National Association of State Boards of Education, 2002). School counselors are key players in the healthy physical, cognitive, social, and emotional development of youth. First, school counselors are trained to manage the emotional development of youth, and they are taught to assess how many elements of life (including childhood physical health) may effect a child's emotional development. Additionally, many school counselors have acquired some research and program evaluation training while in graduate school. This provides school counselors with the important opportunity to aid in conducting program evaluation to ensure that interventions are effective. Finally, many school counselors are trained in consultation skills, which provide them with the ability to coordinate with community resources to ensure that students are receiving the best possible physical health education and that school staff is being supported through trainings, help in curriculum development, and funding. In the end, schools become one of the most ideal locations to address child and adolescent physical health, with school counselors being one of the most appropriate school personnel to lead implementation of these programs.

Racial/Ethnic and Socioeconomic Disparities in Child and Adolescent Physical Health Care

National initiatives such as *Healthy People 2010* (Department of Health and Human Services [DHHS], 2005) have demonstrated our nations' commitment to addressing and eliminating health disparities based on gender, race/ethnicity, education, socioeconomic status, disability, geographic location, or sexual orientation; however, disparities in primary care access, quality, and satisfaction continue to prevail. Additionally, many children in the United States continue to be uninsured or underinsured in regards to private or public health insurance. Overall, the U.S. health care system persists in providing adequate health care for some—but not all—of the nation's children and adolescents.

In preface to the discussion of racial/ethnic disparities in health status among children/adolescents, it is necessary to discuss the issue of the relationship between race and socioeconomic status (SES) in the United States. Since high proportions of racial/ethnic minority children in the United States also are more likely than White families to be of lower income, it is difficult to attribute disparity findings to just race/ethnicity. Only recently have studies begun to control for SES and/or race/ethnicity in their research. Therefore, conclusions regarding this area of research need to take the relationship between race/ethnicity and SES into account when interpreting findings in this area.

The United States continues to be the *only* Western industrialized nation that does not guarantee primary care preventative medical services to its citizens through universal health care coverage (G. D. Stevens & Shi, 2003). According to the U.S. Census Bureau (Bhandari & Gifford, 2003), 12.1% of children age 18 and younger were uninsured in 2001. Racial/ethnic minorities continue to be the majority of uninsured children, with 24.9% of Hispanic children, 22.3% American Indian children, 14.3% African American, 12.1% Asian/Pacific Islander, 11.4% Whites, and 7.6% non-Hispanic Whites all uninsured (Bhandari & Gifford). Although government initiated programs such as Medicaid and state Child Health Insurance Program (CHIP) insured over 29 million children in 2003, 62% of the 10 million uninsured children who were eligible for the programs were not enrolled (Kaiser Commission on Medic-

aid and the Uninsured, 2005). Uninsured Medicaid-eligible children are twice as likely as those insured by Medicaid to have an unmet medical need, to not have seen a doctor, and to have large out-of-pocket family expenditures on medical care (Kaiser Commission on Medicaid and the Uninsured). Additionally, due to the current budget cuts in the United States, the national government has cut funding to Medicaid, and some state-based programs have frozen new CHIP enrollment, raised premiums, and made enrollment in health insurance programs more difficult for families (Kaiser Commission on Medicaid and the Uninsured). Although policy initiatives demonstrate a national recognition regarding the alarming health disparities in the United States, without proper funding, it is likely that this health care crisis will continue to challenge low-income families in accessing quality preventative health care for their children.

Healthy People 2000 developed a list of 18 Health Status Indicators (HSIs) for all people to determine the health of the nation in multiple key areas, as well as to examine differences and/or disparities between populations. Overall, the final profile of the 1990s showed many racial/ethnic health disparities between populations (children and adults). The HSIs that showed the greatest degree of racial/ethnic disparity were in tuberculosis case rates, syphilis case rates, homicide death rates, and live birth rates (Keppel, Pearcy, & Wagener, 2002). The populations that made the smallest improvements as compared with other racial/ethnic groups regarding these HSIs were the American Indian and Alaskan Native population (Keppel et al., 2002). Overall, there continue to be great differences between the overall health of racially/ethnically specific groups in the United States.

Although few studies have been conducted specifically on racial/ethnic disparities in primary medical care for children and adolescents (G. D. Stevens & Shi, 2003), research in the area of racial/ethnic child/adolescent populations continues to grow. One of the main areas that continue to be addressed both in the adult and child literature around racial/ethnic health disparities is *access* to health care. Shi and Stevens (2005) found that prior to and after controlling for poverty status and demographic variables, racial/ethnic minority children (Asian, Black, Hispanic) were less likely than White children to have a regular source of care (physician, clinic, etc.), to have had a health professional or doctor visit in the past year, and to have had a dental visit in the past year (except Asian/Pacific Islander). Additionally, in another study, Weinick and Krauss (2000) found that, after controlling for health insurance and SES, Black and Hispanic children were substantially less likely than White children to have a usual source of care. Interestingly, when language ability was controlled for, it completely eliminated the differences between Hispanic and White children. Therefore, Weinick and Krauss added that language difference puts Hispanic children at a great disadvantage in terms of access to care. In addition, low-income children with Medicaid coverage were found to be more likely to have a usual source of care and to receive care within an appropriate time interval as compared with low-income children without Medicaid (St. Peter, Newacheck, & Halfon, 1992). Finally, Newacheck, Hughes, and Stoddard (1996) found that poverty, minority status, and absence of insurance exerted independent effects on access to and use of primary care. They found that low-income, minority, and uninsured children were twice as likely as children in the reference group (children above the poverty line, children not belonging to a racial/ethnic minority group, and children with health insurance) to lack usual sources of care and used only about half as many physicians' services (after adjustment was made for health status). Overall, it appears that racial/ethnic minority children continue to have significant barriers in access to health care, along with low-income children, children (or caretakers) that do not speak English, and children who do not have health insurance.

Although access to care is a significant health disparities issue and some scholars believe that by increasing access to care many socioeconomic disparities in health status will lessen (Andrulis, 1998), even when access to care is granted, the disparities in quality of care provided to racial/ethnic minorities as well as lower income individuals continues to be an issue. When looking at quality of care, funding of care (facilities, availability of treatment, etc.) and provider characteristics (provider's cultural competence in caring for patients) become large issues. Additionally, *quality* continues to be a very value-laden and culturally determined construct which creates challenges in determining a definition. Therefore, quality of care is a difficult construct to measure and tends to be looked at through self-report satisfaction measures as well as frequency counts of particular events taking place within the visit. Shi and Stevens (2005) found in 1996 (but not in 2000) that Hispanics and African Americans were more likely to be dissatisfied with the quality of care provided (after controlling for sociodemographics and poverty status). Additionally, St. Peter et al. (1992) found that low-income children with Medicaid were less likely than children living above the poverty line to have continuity between usual sources of routine care and sick care as well as were less likely to receive routine care in physicians' offices.

One of the frequently cited issues regarding access and quality of health care is the high number of children and adolescents that use the emergency room as their primary source of care over a clinic or physician's office. Emergency rooms are not designed to serve as primary care settings, the consistent use of which creates a barrier to the delivery of

quality care (Bliss, 1982). In looking at population-specific differences of those individuals who frequent emergency rooms, African Americans were noted in a 1996 study to use emergency departments as their regular source of care at twice the frequency of White children (Halfon, Newacheck, Wood, & St. Peter, 1996). Additionally, in a hospital in Honolulu, Hawaii, Yamamoto and colleagues (1995) found that Polynesian children (i.e., Hawaiian, Samoan, and other Pacific Islanders) were more likely to use emergency departments than European and African Americans. However, these frequent users of emergency rooms were not noted as being a function of not having insurance and/or a primary care physician. Mayberry, Mili, and Ofili (2000) concluded that the frequent use of emergency rooms or their use as a primary source of care may be explained by sociocultural factors more than socioeconomic issues (such as insurance). Therefore, it is still not completely understood why specific populations use emergency rooms for primary care purposes more frequently than others do. If, however, sociocultural factors are a significant factor in this aspect of health care, school counseling programs can address these concerns within their curriculum.

Many health professionals are seeing a great need in the field to educate doctors, nurses, and other health specialists in how to work with patients from a culture different from their own. Curricula for training physicians in culturally competent care, specifically for adolescents, are being developed (Sylvester et al., 2003); however, few practitioners have had training in cultural competence, particularly for working with children and/or youth. Even when culturally diverse youth do receive medical care, it is likely that it comes from a physician who does not take into account their cultural background, beliefs, or values. This ultimately affects the quality of care that the adolescent receives, as well as his or her satisfaction regarding that care.

Poor quality of care and limited access to care can impact on students and their learning. School counselors are likely to be confronted with multiple students who do not have access to health insurance and may not be receiving adequate care for illnesses. This requires school health staff (nurses, school counselors, school psychologists, etc.). to be able to attend to children with unmet health needs and to be knowledgeable regarding community-based health resources for students and families if there is a need for a referral.

Physical Health Disorders in Children and Adolescents

Chronic Illness in Children

Although the majority of children are healthy and do not have to manage living with chronic disease, illnesses such as AIDS, cystic fibrosis, sickle cell anemia, epilepsy, diabetes, and asthma are diagnosed in children and significantly impact their lives. Many children with chronic illness are able to effectively manage their disease while maintaining close relationships with their caregivers, building lasting friendships with peers, and earning good grades in school; however, these children tend to face additional challenges. School in particular can be a challenging environment for children whose peers and teachers may have incorrect assumptions regarding a child's disease or may not understand the impact that a particular disease has on that child. Although this section will not discuss the particulars of all chronic diseases that are diagnosed in childhood and adolescence, it will address how educators can establish an effective and supportive learning environment for students diagnosed with chronic disease in their schools.

What is chronic illness? The medical and educational communities continue to be challenged in how to define chronic illness for children. Different definitions of chronic illness are required in order to provide multiple types of services for children with chronic health conditions. For instance, medical model diagnoses (such as type 2 diabetes) are needed for medical professionals to classify and reach a common understanding of the etiology and treatment of a particular illness. Additionally, the federal government has created chronic illness definition policy (like the Individuals with Disabilities Act—IDEA) to determine who is eligible to receive particular services at schools. Typically, definitions of chronic illness differ between the medical and the educational community, which causes challenges for school districts in providing services to youth (Thies, 1999). In one attempt to create a more integrative definition of chronic illness, Stein, Bauman, Westbrook, Coupey, and Ireys (1993) created a multidimensional, noncategorical approach to defining chronic illness in children. A chronic condition is defined as one of biological origin that persists for at least 3 to 12 months and is supplemented with at least one of the following issues: (1) limitations in daily functioning; (2) reliance on things such as medications, special diets, or assistive devices; and (3) a need for services beyond routine medical care (Stein et al., 1993).

More than 200 chronic health conditions are diagnosed in children and adolescents aged 18 and younger (Thies, 1999). Dependent upon the definition of chronic illness, it has been estimated that between 6.5% and 31% of children at some time in their childhood could be diagnosed with a chronic illness (Thies). Many educators and school health professionals are challenged by understanding the breadth and depth of each of these illnesses and particularly how they individually affect each child. The following section briefly addresses some common characteristics of a few of the more prominent chronic illnesses in children and

adolescents. Educators and school health professionals are encouraged to supplement their reading in this area with information about illnesses with which students in their schools are diagnosed.

Asthma. Asthma is the leading chronic illness among children (American Lung Association [ALA], 2005). About 12% of children in the United States have been diagnosed with asthma (CDC, 2004c), which translates to about 3 children in every classroom of 25 children (CDC, 2004a). Asthma prevalence rates in the United States do not appear to be leveling off or decreasing. The prevalence of asthma in children increased an average of 4.3% per year from 1980 to 1996 (CDC, 2005a). Children ages 5 through 17 missed 14.7 million school days due to asthma (CDC, 2002a). Educators are being confronted with increased responsibility in the prevention and management of childhood asthma in their schools.

Asthma is a chronic respiratory disease that is characterized by the inflammation and narrowing of the bronchial tubes which may be accompanied by respiratory attacks (CDC, 2002a) and is a response to various environmental triggers such as cockroaches, dust mites, furry pets, mold, tobacco smoke, certain chemicals (CDC, 2005a) and allergens, infections, exercise, or abrupt changes in weather (CDC, 2002a). The severity of asthma ranges from mild to life-threatening (CDC, 2002a). Asthma is the third leading cause of hospitalization for children under age 15 (Hall & DeFrances, 2001). Over a 17-year period (1979–1996), the number of childhood deaths attributed to asthma increased almost threefold from 93 in 1979 to 266 in 1996 (CDC, 2005a). From 1980 to 1998, adolescents had a higher death rate from asthma than younger children (almost twice as large) (Akinbami & Schoendorf, 2002). Overall, asthma continues to be a significant risk factor for children that can considerably affect quality of life.

There continue to be many racial and ethnic disparities regarding asthma prevalence and quality of care for children. Akinbami and Schoendorf (2002) used multiple data sources to assess trends in childhood asthma rates in the United States. They reported that the gap between Black and White children who were diagnosed with asthma widened from 15% higher rates for Black youth in 1980–1981 to 26% higher in 1995–1996. Additionally, Black children had an asthma attack prevalence rate 44% higher than that of White children in 2000. Hispanic children were reported to have an average annual prevalence rate higher than White children from 1995–1996 (76.1 per 1000, as compared with 65.3 per 1000), but then in 2000, had a lower rate of asthma attack (42.1 per 1000, as compared with 53.4). From 1998–1999, Black children were over 3 times as likely as White children to be hospitalized due to asthma, and in 1997–1998, Black children were 4 times as likely as White children to die from asthma. Finally, Hispanic children's death rates due to asthma were comparable with those of White children. Overall, Akinbami and Schoendorf (2002) demonstrated that there continue to be large disparities between Black and White/Hispanic populations with regard to asthma prevalence, hospitalization, and mortality.

Socioeconomic disparities have also been noted regarding prevalence rates of asthma. Children from lower income families have a higher asthma prevalence rate (16%) as compared with children from families that were not low-income (11%; CDC, 2004c). Halfon and Newacheck (1993) demonstrated that lower income children were more likely to have more than 7 bed days in the last year, to have 40% fewer doctor's visits, and 40% more hospitalizations in the previous year. Additionally, lower income children were found to be at higher risk for inadequate asthma therapy (taking maintenance medications such as inhaled corticosteroid, cromolyn, or theophylline; Halterman, Aligne, Auinger, McBride, & Szilagyi, 2000), which is intended to prevent asthma complications that may require hospitalization. This suggests that the disparity in asthma rates may be due to the negative interaction between environmental stressors and access to health care among lower income Americans. It also suggests that the inadequate management of the illness will have a direct impact on the child's learning as a result of repeated absences from school. At very least, facilitating the process of making up for lost learning is one in which the school counselor needs to be involved at both the individual and systemic level.

Since asthma continues to be a significant health issue that affects many children, schools continue to need resources to manage and prevent childhood asthma among students. The Centers for Disease Control (2005e) has developed strategies for schools to effectively address asthma within a school health program. These strategies include (1) establishing management and support systems for asthma-friendly schools; (2) providing appropriate school health and mental health services for students with asthma; (3) providing asthma education and awareness programs for students and school staff; (4) providing safe and healthy school environment to reduce asthma triggers; (5) providing safe, enjoyable physical education and activity opportunities for students with asthma; and (6) coordinating school, family, and community efforts to better manage asthma symptoms and reduce school absences among students with asthma (CDC, 2005e). Schools should contract with students, parents, and physicians in the form of an "asthma action plan" that provides students, parents, and educators with a detailed and personalized method to handle asthma emergencies at school (CDC, 2005e). Additionally, schoolwide case management of students with asthma needs to take place between counselors, school nurses,

teachers, and administrators to effectively aid students with frequent school absences, emergency room visits, and/or hospitalizations due to asthma (CDC, 2005e). Overall, preplanning and effective communication between school personnel can aid in helping students effectively manage their asthma.

Although asthma is a common disease in childhood, many schools do not have adequate school resources in place to effectively serve these students. A part-time or full-time nurse is on staff in 76.8% of schools, but only 52.9% of schools have the recommended nurse-to-student ratio (1:750) or better (CDC, 2000b). Only 44.6% of schools have Tobacco-Free Environment policies that prohibit cigarette, cigar, and pipe smoking use by students, faculty, staff, and visitors in school buildings, on school grounds, and at off-campus school sponsored events (CDC, 2000b). Students are allowed to self-administer an inhaler in 68% of schools (CDC, 2000b). Finally, the median percentage of schools that provided asthma education to school staff was 51.9% (CDC, 2000b). Many schools are not effectively managing asthma among their students. As part of the student personnel team, a school counselor needs to consistently raise the issue of physical health as a part of student achievement. A plan to ensure compliance with interventions and with quality prevention needs to be integrated into a comprehensive developmental guidance program.

Cancer in children and adolescents. Over the past 30 years, there have been numerous medical advances that have aided in the diagnosis and treatment of childhood cancer. Many more children are surviving cancer than had previously. Overall, the death rates of children from cancer are declining about 2% to 3.2% per year (Ries, 1999). Many children diagnosed with cancer during childhood are living into adulthood. Over the past 30 years, the survival rate for children diagnosed with cancer has increased from 30% to 80% (National Cancer Institute, 2005). Additionally, these children are more likely to have a better quality of life throughout childhood and into adulthood, and they are less likely to suffer from negative long-term effects following treatment (National Cancer Institute). Although medical researchers are making great progress regarding the treatment of childhood cancer, it is still a disease that affects a large number of children and adolescents. Cancer is the second leading cause of mortality in children ages 5 to 14 years old (CDC, 2004b). Cancer continues to be an extremely serious disease that immensely impacts the lives of many children in the United States.

The most common form of cancer in childhood is leukemia (National Cancer Institute, 2005). Leukemia is a cancer of the blood that develops in the bone marrow, which is the location in the body that creates blood cells (National Cancer Institute). The majority of childhood leukemia cases are diagnosed as acute lymphoblastic leukemia (ALL) type (Smith, Ries, Gurney, & Ross, 1999). Although little is known regarding the risk factors involved with ALL, potential causes include prenatal exposure to X-rays and genetic syndromes such as Down syndrome (Smith et al.). ALL is most likely to be diagnosed between ages 2 and 5; however, it can be diagnosed from infancy into adolescence (Smith et al.). There are 30% more males diagnosed with ALL than females (Smith et al.). Additionally, European-American children have a two-fold higher increase of being diagnosed with ALL than African American children (Smith et al.). Overall, approximately 80% of children diagnosed with ALL survive into adulthood, with children diagnosed older than 1 year of age having the most favorable survival rates (Smith et al.).

Children diagnosed with cancer can receive many different types of treatment. The most common treatments are chemotherapy and radiation. These treatments can cause multiple side effects and can cause challenges to individual student learning. Every child responds differently to cancer treatment; however, radiation has been shown to impact learning through impaired attention, short-term memory, visuomotor coordination, and information processing (Thies, 1999). Additionally, chemotherapy treatment can impact student learning through increased fatigue, greater risk for infection, and fears of going to school (due to physical appearance differences such as hair loss; Thies). Educators can help aid students with chronic illnesses by more specifically understanding the side effects of treatments and the implications for child learning in their classroom. They also need to recognize and respond to the social and learning challenges associated with absence from school due to treatment.

Diabetes. Diabetes is an illness in which the body does not produce or properly use insulin (American Diabetes Association [ADA], 2005). Insulin is a hormone in the body that is required for the conversion of food (such as sugar and starch) into energy (ADA, 2005). There are two main types of diabetes diagnosed in children and adolescents: Type 1 diabetes and type 2 diabetes. Type 1 diabetes (previously labeled "juvenile diabetes") is typically diagnosed in children and adolescents (ADA, 2005). People with type 1 diabetes do not produce insulin in their bodies. This makes it difficult for their bodies to use sugar and to create energy (ADA, 2005). Type 2 diabetes is typically diagnosed in adolescence or adulthood and is the most prevalent type of diabetes (ADA, 2005). Individuals with type 2 diabetes do not produce enough insulin or their cells ignore the insulin produced (ADA, 2005). There has been an increase in the number of children/adolescents diagnosed with type 2 diabetes over the past few decades (ADA, 2000; Fagot-Campagna et al., 2000).

Until recently, type 1 (or juvenile diabetes) was the only type of diabetes deemed appropriate to diagnose during childhood or adolescence (ADA, 2000); however, medical experts have made a shift in how they think about type 1 and type 2 diabetes. The American Diabetes Association (2005) has reported that about 2 million overweight American adolescents have prediabetes. They indicate that diagnoses of type 2 diabetes in children and adolescents continues to be rare, but provide the caveat that we have not developed a sophisticated tracking system of type 1 versus type 2 diabetes diagnoses in children. It continues to be unclear how the number of type 2 diabetes diagnoses in children has shifted in recent decades.

The majority of children with type 2 diabetes are obese at diagnosis (ADA, 2000). Type 2 diabetes is typically diagnosed in children when they are in middle to late puberty or over the age of 10 (ADA, 2000). It has been speculated, however, that as younger and younger children become more overweight, the incidence of type 2 diabetes in children may increase and may be found in younger children (ADA, 2000). Risk factors associated with a type 2 diabetes diagnosis include (1) having a family member with type 2 diabetes, (2) being an obese adolescent, (3) being female, and (4) being a member of a racial/ethnic minority group (including American Indian, African American, Hispanic-American, and Asian/South Pacific Islander populations; ADA, 2000).

Children and adolescents in racial/ethnic minority groups are more likely to be diagnosed with type 2 diabetes than are their European-American counterparts (ADA, 2000). In particular, the Pima Indians of Arizona have been shown to have one of the highest prevalence rates of type 2 diabetes in any racial/ethnic group. In a study from 1992 to 1996, the prevalence rate for type 2 diabetes in Pima Indians ages 15 to 19 was 50.9 per 1000, and for Pima Indian children ages 10 to 14 it was 22.3 per 1000 (Fagot-Campagna et al., 2000). Overall, there have not been substantial population-based studies on the prevalence of type 2 diabetes in other racial/ethnic minority populations, but it is believed that these rates are higher than in European-American populations.

In a study regarding school nurses' perceptions of how adolescents diagnosed with diabetes manage school, 98% of nurses surveyed agreed that adolescents with diabetes need more support at school (Nabors, Troillett, Nash, & Masiulis, 2005). First of all, the nurses indicated that school staff needs to be further educated regarding diabetes and how it affects students. Teachers and other school staff need to make accommodations for students with diabetes to provide them with access to food and water at all times and to allow them to carry their testing equipment with them through the school (which may violate backpack carrying rules). Next, communication between the student, parents, school nurse, and the student's doctor needs to take place to ensure that the student is receiving appropriate care in school. Teachers need to be involved in these discussions as well to ensure that the student's health needs are being met in the classroom. Additionally, the nurses discussed how parental involvement was extremely important. Without continuity between caretakers and the school's management of a child's diabetes, it can be challenging to support the student in the healthy management of the student's diabetes. Finally, school staff (in particular, school counselors) need to be aware of how diabetes affects student mental health and social involvement with peers. It can be very challenging for a child with diabetes to have to avoid hanging out with peers due to their food choices or to endure being rewarded for good behavior in class with foods that they cannot eat. Many students can feel left out, depressed, and angry when they are constantly put in situations where they cannot participate in social functions that involve eating. School staff need to find ways to best facilitate overall support of children with diabetes in school.

How can educators provide appropriate services for children with chronic illness? Schools are faced with multiple challenges in offering appropriate services to children with chronic illnesses. Providing services for children with chronic illnesses can be particularly challenging due to the fact that these children tend to frequently fluctuate between states of good and poor health (Thies, 1999). Unlike with disabilities such as mental retardation and emotional/behavioral disorders, school health professionals and educators are required to more frequently alter their approach for working with these students' absences from school and daily abilities to participate in classroom activities. Thies provided five guidelines for schools to address the educational implications for students with chronic health conditions:

1. Schools should recognize that many students do have chronic health conditions and that this population is not shrinking.
2. Schools may need to identify students with chronic illness without self-disclosure from students or their families.
3. Educators and school health professionals need to create a system for identifying and aiding students with chronic illness.
4. Schools need to address the difference between providing accommodations for chronic illness (such as giving more time to make up assignments) and education for students with chronic illness (providing students with lessons, etc.). Just allowing students time to make up missed work may not give

them the necessary instruction to understand and learn certain lessons.
5. Schools can begin to think creatively about students with chronic illnesses and not try to fit them into previously existing programs.

It becomes extremely important for schools to begin to treat students with chronic health conditions as a separate population that has specific needs and will benefit most significantly from policies and programs catered to these needs.

Children who reenter school following hospitalization or other treatment for chronic illnesses may face many challenges to learning at school. First of all, many children may experience lethargy, chronic nausea, fatigue, and overall weakness that may make it difficult for them to learn (Sexson & Madan-Swain, 1993). Additionally, many children may be experiencing a lot of pain, which can hinder concentration (Sexson & Madan-Swain). Various medications can cause sedation, increase irritability, and decrease attention span in some students (Sexson & Madan-Swain). Finally, certain medical treatments can decrease children's immunity to common illnesses such as colds, which can lead to more absences from school (Sexson & Madan-Swain). All of these physical symptoms can make it challenging for students to attend to academic learning.

Children with chronic illnesses are also likely to suffer from symptoms of mental disorders as well. In a study of depression in adolescents with asthma, sickle cell disease, cystic fibrosis, insulin-dependent diabetes, and spina bifida, Beck Depression Inventory (BDI) scores were compared between healthy controls and adolescents with one of these chronic illnesses. Key, Brown, Marsh, Spratt, and Recknor (2001) found that a higher percentage of adolescents with chronic illness had moderate or severe BDI scores than the control group. Additionally, adolescents with chronic illness who rated their disease as moderate to high in severity reported more symptoms of depression than those adolescents that reported their chronic disease as mild (Key et al.). It appears that adolescents suffering from moderate to severe mental illness are also likely to experience multiple symptoms of depression, which can create additional challenges for adolescent learning in school.

In addition to physical challenges, students with chronic illnesses face many social challenges at school as well. Students are faced with the reality that many of their teachers do not completely understand their illness and many are not trained to work with children with chronic illnesses. In a survey of Midwestern teachers, almost all the teachers in the sample reported working with children with chronic illness, yet 64% reported no on-site training for working with these students (Clay, Cortina, Harper, Cocco, & Drotar, 2004). This lack of training can result in teachers' inaccurate assessment of the child's physical symptoms, as well as their academic and social skills (Sexson & Madan-Swain, 1995). In addition to a lack of training, many teachers have lower expectations for children with chronic illness (Northham, 1997), which can place children at risk for academic failure (Clay et al.). Teachers have reported feeling frustrated, helpless, and apprehensive regarding working as both educators and health managers in the classroom (Clay et al.). Additionally, many teachers are not given the support within their schools to personally deal with the death of a student (Rowling, 1995). Schools need to address the training needs of educators around chronic illness in students to improve teacher efficacy in working with these students, to increase the teacher's fund of knowledge about chronic illness that can address the questions of students in the classroom, and to provide a higher standard of care to children diagnosed with chronic health conditions.

In a qualitative study looking at the inclusion of students with chronic illness in mainstream schooling, students communicated what support they needed from their school and from their teachers in particular. Students in this study felt the need for support in managing school absences, taking part in school activities, developing and maintaining peer relationships, aiding other students to understand their health condition, and having someone to talk to at school about their illness (Mukherjee, Lightfoot, & Sloper, 2000). Teachers and school counselors could help students with chronic illness in their school by asking them what sources of support they feel are needed for them to succeed at school and by facilitating the previously identified support systems in classrooms and the school as a whole.

School counselors and other school staff need to pay particular attention to how other students in the school environment think about a child's illness and how they treat this child. In a study on fourth-, fifth-, and sixth-grade students' perceptions of peers with chronic illness, Cole, Roberts, and McNeal (1996) found that fourth graders were more likely to indicate that children diagnosed with the diseases studied (diabetes, asthma, AIDS, and cystic fibrosis) were contagious and that they were the least accepting of their peers diagnosed with these illnesses. This finding confirmed other research that older children tend to be more accepting of children with chronic illness (Royal & Roberts, 1987). Additionally, Cole and colleagues (1996) found that the students studied considered children with AIDS to carry the most responsibility for their diagnosis as compared with children with other chronic illnesses. The authors remarked that this finding is consistent with other researchers and may be due to the fact that AIDS is a frequently discussed disease and that children are taught about AIDS prevention (which may inadvertently teach

the presumption that individuals are responsible for their AIDS diagnosis). Overall, many children have biased and inaccurate perceptions regarding chronic illnesses. School counselors and other educators need to address disease contagion perceptions, children's responsibility for their disease, and acceptance of peers with chronic illness to provide students with accurate education about chronic disease and to provide students with chronic illnesses a supportive social space at school.

Other Childhood Medical Conditions

Weight-related disorders. One of the most prevalent and concerning current health conditions for people in the United States involves weight-related disorders (including obesity, eating disorders, and disordered eating behaviors). Not only are adults battling with being overweight or underweight, but an increasing number of children and adolescents are also being diagnosed with weight-related diseases (CDC, 2005d; Hoek & van Hoeken, 2003). These conditions are very prevalent in both staff and students at schools, with very few educators knowing how to best aid their students (or themselves) in developing and maintaining healthy body weight (Yager & O'Dea, 2005). Many schools are taking it upon themselves to provide preventive curricula for eating disorders and obesity. Many curricula, however, focus on only one end of the spectrum of weight-related disorders, which may end up unintentionally causing one disorder (e.g., anorexia nervosa) while teaching a curriculum to prevent another weight-related disorder (e.g., obesity; Neumark-Sztainer, 2003). Although anorexia nervosa is not necessarily the "opposite" of obesity, it can be helpful for educators to view weight-related disorders along the spectrum represented in Figure 16.1 in order to address both the extreme weight-related disorders, as well as more minor disordered eating behaviors. Some researchers in the field of weight-related disorders are encouraging prevention efforts to provide more of an integrated approach that focuses on many facets of disordered eating in an attempt to provide considerably clearer (nonconflicting) messages to children about weight, more cost-effective interventions (focusing on all weight-related disorders rather than one piece, e.g., eating disorders), and fewer time-intensive programs for students (and staff trainings; Neumark-Sztainer, 2003). The following overview of weight-related disorders focuses on defining the significance of weight-related conditions in the child/adolescent population, briefly defining the characteristics of these disorders, and finally, reviewing a few school-based interventions to prevent weight-related disorders in children and adolescents.

Overweight and Obesity The U.S. Surgeon General has named the obesity "epidemic" as one of the greatest health problems facing Americans today (DHHS, 2001). Over the past 20 years, individuals have made dramatic environmental, cultural, and vocational lifestyle changes that have ultimately contributed to the increased prevalence of overweight and obesity in the United States. Many factors have played a role in this epidemic, including (1) increased access and dependence on high-fat and high-caloric fast food, (2) increased consumption of sugary beverages (e.g., sodas, sports drinks, fruit juices with less than 100% fruit juice), (3) larger food portion sizes, (4) decreased vigorous physical activity, (5) increased sedentary leisure time (i.e., TV watching, Internet surfing, videogame playing), and (6) increased reliance on automobile and train transportation, to name a few. Additionally, research continues to uncover the genetic underpinnings of overweight and obesity diagnoses (CDC, 2002b). Alarmingly, not only are America's adults becoming fatter, but this epidemic has reached child and adolescent populations as well. Clearly, radical steps need to be taken to reverse the harmful effects of obesity and overweight in America's children.

In the medical community, overweight is typically defined as being children who are at or above the 95th percentile for Body Mass Index (BMI) for their particular age and sex (CDC, 2005b). Additionally, children who are classified as being "at risk" for overweight are those whose BMI scores fall ≥85 percentile and <95 percentile. BMI is the proportion of total body weight to skeletal height and is measured through national growth chart data collected since 1963 on population height and weight (CDC, 2000a). The national growth chart data are collected through a stratified, multistage probability sample of civilians, or noninstitutionalized people, living in the 48 contiguous United States (CDC, 2000a). In addition to BMI scores, many studies collect additional data on the triceps skinfold

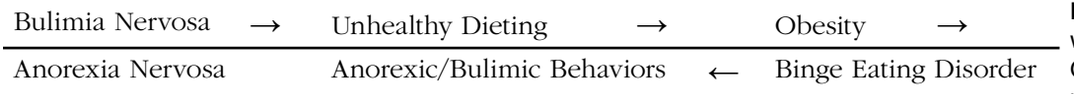

Figure 16.1 The spectrum of weight-related disorders. (From Obesity and eating disorder prevention: An integrated approach?, D. Neumark-Sztainer, 2003, *Adolescent Medicine, 14*(1), 159–173).

thickness (TSF) test and the subscapular skinfold test (SSF), which measure skinfold thickness in participants. Finally, some studies estimate body fat mass through bioelectrical impedance analysis (BIA), which uses electrical signal to estimate body fat mass. Overall, BMI, TSF, SSF, and BIA tend to be moderately correlated in studies.

Overweight and obesity is greatly affecting the child and adolescent population. From 1999 to 2002, 16% of American children ages 6 to 19 were overweight (Hedley et al., 2004). Additionally, 31% of children and adolescents were at risk of becoming overweight (BMI $\geq$ 85 percentile and $<$ 95 percentile). The current frequency of overweight in children has more than *doubled* and for adolescents has more than *tripled* since 1980 (Hedley et al.; Ogden, Flegal, Carroll, & Johnson, 2002). Additionally, it does not appear that these numbers have substantially improved in the years 2001–2003 (CDC, 2004d). Children and adolescents in the United States are much larger now than they have been in recent years, and it does not appear that these numbers will change any time in the near future.

Similar to other diseases, there continue to be large disparities between European-American populations and racial/ethnic minority populations regarding prevalence of overweight population. The National Health and Nutrition Examination Survey (NHANES) studied children and adolescents ages 6 to 19. The results from 1999 to 2002 demonstrated that non-Hispanic Black children and adolescents had a 20.5% obesity prevalence rate and a 35.4% prevalence rate for being at risk for overweight (Hedley et al., 2004). Mexican-American children and adolescents had a 22.2% prevalence for obesity and a 39.9% prevalence for being at risk for overweight (Hedley et al.). Additionally, in a smaller scale study in Washington, DC, El Salvadorian children had comparable numbers to Mexican-American children and adolescents of 38% overweight (BMI $\geq$ 95th percentile) and 22% at risk for overweight (BMI 85th–94th percentile; Mirza et al., 2004). These numbers are significantly different from the prevalence rates for non-Hispanic White populations at 13.6% and 28.2%, respectively (Hedley et al.). Because few large population-based studies have assessed the prevalence of obesity and overweight among Native American populations living on reservations (Story et al., 2003), the majority of our data regarding obesity and overweight in Native American populations turns to relatively small sample size studies. This makes it more challenging to establish prevalence rates for overweight and obesity in the Native American population. In general, these studies indicate that prevalence rates for obesity in Native American children/adolescents (BMI $\geq$ 95th percentile) range between 13.7% for both boys and girls (CDC, 2001) to 22% for girls and 18% for boys (Zephier, Himes, & Story, 1999). Additionally, prevalence rates for overweight in Native American children/adolescent populations (BMI 85th–94th percentile) ranged from 29.3% in both boys and girls (CDC, 2001) to 40% for girls and 35% for boys (Zephier et al.). Although it is still relatively unclear regarding specific prevalence rates, it appears that Native American populations are facing an obesity epidemic similar to other racial/ethnic minority populations. Overall, racial/ethnic minority populations have significantly higher rates of overweight than their European-American counterparts, which continues to speak to the marked rates of health disparities between groups.

In addition to racial/ethnic disparities in obesity rates, there are also disparities in obesity rates, based on socioeconomic status (SES), in children and adults. It appears that childhood obesity is more common in children of lower SES (Crawford, Drury, & Stern, 1999; Sobal & Stunkard, 1989). Additionally, it appears that childhood SES may have an impact on adult obesity status. In a cross-sectional study, Power, Manor, and Matthews (2003) found that social class from birth to 7 years of age predicted adult obesity for women and men. Although lower SES seems to be a risk factor for obesity, there tend to be differences among racial/ethnic groups. Zhang and Wang (2004) found that the degree of socioeconomic inequality varied considerably across ethnic group, gender, and age. Additionally, in a study of 9- and 10-year-old African American and Caucasian girls, Crawford et al. found that for the Caucasian girls, the prevalence of obesity dropped for girls with higher household income and higher parental education, but that for the African American girls, there was no significant correlation between household income, higher parental education, and prevalence of obesity. Overall, it appears that SES is a risk factor for childhood obesity, although this impact is dependent upon other variables such as gender, age, and race/ethnicity.

One hypothesis regarding the higher prevalence of obesity in lower SES groups is the lower prices of high-energy dense foods (e.g., butter, oil, margarine) as compared with lower energy dense foods (e.g., lean meats, vegetables, fruits). It has been shown that energy dense foods such as margarine, oil, and butter cost less than lower energy dense foods such as lettuce, other fresh vegetables, and frozen fish (Drewnowski & Specter, 2004). Additionally, the price of high-fat and high-sugar foods has become cheaper over the past few decades as compared with fresh fruit and vegetables (McCarthy, 2004). It is not surprising that it becomes more challenging for lower SES families to eat healthy foods such as lean meats, fresh vegetables, and fresh fruit.

Additionally, another factor that may be related to obesity in children of lower SES is the characteristics of their neighborhood. It has been shown that children of lower SES are more likely to live in urban neighborhoods and are more likely to encounter high crime rates in their neighbor-

hoods. This makes it challenging for these children to play outside and to engage in physical activity outside of school time. In a study of children who live in urban neighborhoods, it was found that neighborhood safety and social disorder were significantly associated with less physical activity (Molnar, Gortmaker, Bull, & Buka, 2004). Additionally, a study on preschool children's neighborhood safety, outdoor playtime, and television time demonstrated that children whose mothers perceived that their neighborhood was unsafe watched significantly more television, but did not play outside less than children in perceived safe neighborhoods did (Burdette & Whitaker, 2005). Some communities are attempting to address neighborhood safety issues by creating safe spaces for children to exercise in their neighborhood and/or at schools and/or by creating programs that promote safe transportation to school through walking or biking.

Children and adolescents who are overweight are at risk for having additional damaging health conditions. Recently, typical weight-related conditions that were previously diagnosed only in adults are now plaguing children as well. For instance, type 2 diabetes. more commonly known as "adult onset" diabetes, is becoming more frequently diagnosed in overweight youth (ADA, 2000). Additionally, it is estimated that 61% of children/adolescents who are overweight also have at least one risk factor for heart disease, including high blood pressure and high cholesterol (Freedman, Dietz, Srinivasan, & Berenson, 1999). Obesity is also associated with higher rates of sleep apnea and gallbladder disease in children (Dietz, 2004). Being an overweight child carries with it great risks of other significant health conditions.

In addition to the health concerns associated with being overweight during childhood, it is apparent that being an overweight child also carries risks for being overweight in adulthood. Children who are overweight are more likely to remain or become overweight as adults (DHHS, 2001). Additionally, adults who were overweight as children are more likely to have more severe obesity than adults who were not overweight as children (Dietz, 1998; Freedman, Khan, Dietz, Srinivasan, & Berenson, 2001). Similar to children who are overweight, being an overweight adult carries with it many health risks, including higher risk for type 2 diabetes, multiple cancers, cardiovascular disease, stroke, osteoarthritis, and premature death (DHHS, 2001). Given the health disorders that are associated with weight problems, it is vitally important to prevent childhood obesity, not only to improve child/adolescent health and well-being, but also to improve future quality of life in adulthood. Learning the proper management of nutrition and exercise needs to be integrated into all aspects of a child's schooling. School counselors need to integrate these concerns into their guidance programs from issues related to self-regulation and emotional self-awareness to the role of physical status on social relationships.

Obesity and overweight are not only diseases that impact individuals' physical health, but also have large influences on childhood mental health. Americans have been socialized to discriminate against overweight people. Typical stereotypes carried regarding overweight people include that they are lazy or lack self-control. The American media teaches us that the ideal body is very thin and that beauty is a function of physical appearance. All of these factors contribute to body dissatisfaction and low self-esteem in many youth, particularly in those who can be considered overweight or obese. Schwimmer, Burwinkle, and Varni (2003) found that severely obese children and adolescents scored lower on a measure of health-related quality of life than children and adolescents who had been diagnosed with cancer. Other studies have shown decreases in physical and social functioning in obese children, but not significant decreases in emotional and school functioning for obese children as compared with children who were not overweight (Williams, Wake, Hesketh, Maher, & Waters, 2005). In a study of African American youth (ages 5 to 10), overweight was associated with low appearance self-esteem and body size dissatisfaction with low global self-worth (Young-Hyman, Schlundt, Herman-Wenderoth, & Bozylinski, 2003). Additionally, Young-Hyman and colleagues (2003) found that weight-related peer teasing was associated with low self-esteem in African American youth. It appears that the emotional influences of obesity and overweight are incredibly apparent in children and adolescents.

Eating Disorders In addition to weight-based illnesses such as obesity, eating disorders have also become alarmingly prevalent among children and adolescents. Among adolescent women (ages 15 to 19), eating disorders are considered to be the third most common chronic illness (M. Fisher et al., 1995). Females are much more likely than males to develop an eating disorder, with only 5% to 15% of the people diagnosed with anorexia and bulimia being male (Andersen, 1995). The estimated mortality rate for people diagnosed with anorexia is very high at 0.56% per year which is 12 times higher than the annual death rate for all other causes of death for females 15 to 24 years of age (Sullivan, 1995). In looking at adult populations, anorexia is considered to have the highest mortality rate of any psychiatric illness (Gardner, Vitousek, & Pike, 1997). Due to the high relapse and mortality rates from eating disorders (specifically anorexia nervosa; Sullivan, 1995), prevention efforts are extremely important. Schools become an excellent context for evidence-based prevention of eating disorders for children and adolescents, interventions that can be delivered through the coordination of the departments of guidance, home economics, and nursing.

Similar to other diseases, the etiology or causes of eating disorders are biological, developmental, sociocultural, and psychological (APA, 2000). Although it is not completely known to what extent, eating disorders tend to be inheritable (Strober, Freeman, Lampert, Diamond, & Kaye, 2000; Walters & Kendler, 1995). Current research is finding genetic underpinnings of eating disorders (Kaye et al., 2000). One main predictor of eating disorders is excessive dieting and exercise (Patton, Selzer, Coffey, Carlin & Wolfe, 1999). Other predictors of eating disorders are physical and sexual abuse (Logio, 2003), early puberty, body dissatisfaction, and negative emotionality (Leon, Fulkerson, Perry, & Cudeck, 1992). Additionally, researchers hypothesize the reason that eating disorders tend to emerge during adolescence may be due to the vast and rapid physical changes that occur in the body during this period of emotional and physical development (Smolak & Levine, 1996). Although the actual combination of factors that are the prescription for the development of eating disorders is unknown, current research in the field points to the predictors described above.

The *Diagnostic and Statistical Manual of Mental Disorders IV-TR* (*DSM-IV-TR*; APA, 2000) provided the prescribed method that physicians and mental health professionals use for eating disorder diagnosis. The three eating disorders as classified by the *DSM–IV–TR* include anorexia nervosa (AN), bulimia nervosa (BN), and binge eating disorder (APA, 2000). The diagnostic criteria for assessing and diagnosing eating disorders can be helpful with older adolescent and adult populations but provides many challenges for diagnosing children and younger adolescents (M. Fisher et al., 1995; Kreipe et al., 1995). Kreipe et al. remarked that diagnosis is difficult because (1) menses is unpredictable in early menarche (and absence of a menstrual period is one component of a diagnosis of AN), (2) normal adolescents have limited ability to engage in abstract thinking (which may affect motivation to lose weight and self-awareness), and (3) there is an overall large variability in the rate and timing of height and weight gain during puberty among adolescents. Therefore, the typical criteria for diagnosing eating disorders in children and adolescents may be difficult to assess and may also be inapplicable.

Although the assessment of children and adolescents for anorexia nervosa (AN) continues to be a challenge, the *DSM–IV–TR* provides a framework that clinicians use to diagnose AN (APA, 2000). The onset of AN occurs at a variety of times within the population (Hoek & van Hoeken, 2003), and the lifetime prevalence rate for AN in females is estimated at 0.5% to 3.7% (National Institute of Mental Health [NIMH], 2001a). Many experts in the field, however, see a large number of adolescents with the disease, hypothetically due to the rapid periods of physical and emotional maturation during this time period (Steiner & Lock, 1998). People with AN have a fear of gaining weight or becoming fat, even when they are at or below their expected body weight (APA, 2000). Although these individuals reach points of being well below ideal body weight, individuals with AN are unable to understand the severity of their condition and do not see themselves as malnourished (APA, 2000). For many people with AN, self-esteem is highly tied to their weight and how they see themselves (which, typically, is a body shape or size much larger than they appear to others). To continue to lose weight in an attempt to reach their ideal body size, people with AN will heavily restrict caloric intake or practice excessive exercise, and some will even practice binging (consuming a large amount of food in a short period of time) and purging. In the end, some individuals with AN may reach such a low body weight that they are not able to function and may need to be hospitalized. AN can cause multiple other developmental issues during the onset of adolescence, and some studies indicate that many health risks associated with eating disorders may be irreversible (Katzman, 2005). Children/adolescents can suffer from acute and severe malnutrition, damage to the brain, and damage to bone tissue (Rome et al., 2003). In the end, the most common causes of death from anorexia nervosa are cardiac arrest, electrolyte imbalance, and suicide (NIMH).

Bulimia nervosa (BN) is an eating disorder that is less frequent in childhood/adolescence than AN, and it seems to have an onset in later adolescence (Steiner & Lock, 1998). The typical onset of BN is between 14 and 25 years of age (Bogliatto, Delvenne, & Flament, 1996); however, clinician reports of BN have been seen in children as young as 10 (Bogliatto et al.). Similarly to AN, BN is more common in females than in males (Hoek & van Hoeken, 2003). The lifetime prevalence rate for females with BN is higher than that of AN, with 1.1% to 4.2% of females acquiring BN in their lifetime (NIMH, 2001b). BN is characterized by uncontrollable episodes of binge eating (APA, 2000). These episodes almost always occur in private, due to the recognition of individuals with BN that this behavior is not "right" and the significant feelings of guilt around engaging in binge eating behavior that individuals with BN have (APA, 2000). Following episodes of binge eating, individuals with BN engage in some form of purging, which may include self-induced vomiting, fasting, use of laxatives, use of diet pills, use of enemas, excessive exercise, or rigid dieting (APA, 2000). Typically, after engaging in this purging behavior, individuals report feeling "relieved" (NIMH, 2001a). Overall, individuals with BN tend to be of normal body weight as compared with individuals with AN (NIMH, 2001a). Similarly to AN, the self-esteem of individuals with BN is highly tied to their body weight and shape (APA, 2000). Many individuals with BN fear gaining weight, feel very unsatisfied with their body size and shape, and have a

strong desire to lose weight (NIMH, 2001a). The process of binging and purging can cause significant health concerns for individuals with BN, including acute and severe malnutrition, brain damage, and bone tissue damage (Rome et al., 2003). Although the mortality rates for individuals with BN are not as high as they are for those with AN (Birmingham, Su, Hlynsky, Goldner, & Gao, 2005), the consequences of BN continue to carry great health risks for children and adolescents.

Binge Eating Disorder Binge eating disorder is one of the more recent eating disorders that has been added to the *DSM–IV–TR* as a "Criteria set and axes provided for further study" (APA, 2000). These disorders are included in the *DSM–IV–TR* because they are likely to have clinical validity but continue to have limited information to include as bona fide disorders (APA, 2000). The research criteria in the *DSM–IV–TR* indicates that individuals with binge eating disorder engage in frequent episodes of out-of-control eating (similar to bulimia nervosa) and have significant stress about the binges, but do not engage in compensatory behaviors such as purging and fasting (APA, 2000). These individuals are likely to present with varying degrees of obesity (APA). Additionally, it is proposed that, similarly to AN and BN, binge eating disorder tends to begin in adolescence or the early 20s (APA, 2000). Multiple population-based studies have confirmed the presence of binge eating disorder (Bruce & Agras, 1992; Spitzer et al., 1993); however, there continues to be questioning in the field regarding the presence of binge eating disorder (Fairburn, Welch, & Hay, 1993). Additionally, similar to other disorders, there is limited research in the area of binge eating disorder in adolescent populations and among racial/ethnic minority populations. As the creation of the *DSM V* is in progress, it is unclear whether binge eating disorder will be included in the next revision of the *DSM*.

A common misconception around eating disorders is that they are only prevalent in Caucasian, female, middle/upper-class populations. Although the majority of people that suffer from eating disorders are female, it is estimated that around 10% to 15% of people who are diagnosed with eating disorders are males (Carlat, Camargo, & Herzog, 1997). Overall, research has shown few differences between how eating disorders are manifested in female versus male populations, and there is a relative consensus that eating disorders are clinically similar in the male and female population (National Eating Disorder Association, 2002); however, a few differences have surfaced in research studies. First, as compared with females (mainly adults) with eating disorders, a higher percentage of males diagnosed with eating disorders identify as being homosexual (Bramon-Bosch, Troop, & Treasure, 2000; Carlat et al.). Only one of the studies that found the high association of homosexuality in the males diagnosed with eating disorders used a design that matched a female comparison group with each of the males studied. No population-based studies have been conducted that observe the incidence of homosexuality in the population and look at the incidence of males who identify as homosexual and are diagnosed with eating disorders within the overall population. Additionally, multiple studies have demonstrated a higher level of comorbidity of eating disorders and other psychiatric conditions (depression, anxiety disorders) in males as compared with females. Because the cultural standards of beauty for men and women are different, it is possible that additional differences regarding the etiology of eating disorders in men and women may surface in coming years.

Similarly to misconceptions around eating disorders and gender, information regarding eating disorders in ethnic minority populations continues to be limited. Since eating disorders tend to be highly tied to cultural ideals of beauty, it becomes increasingly important to study eating disorders within specific ethnic groups. It is possible that many within-group differences regarding eating disorders may be lost when the majority of studies on eating disorders in racial/ethnic populations pool multiple ethnicities under one racial group (e.g., Asian American, Latino/a; Pratt, Phillips, Greydanus, & Patel, 2003). In the end, we have a very limited understanding of how culture impacts the manifestation of eating disorders in racial/ethnic minority populations.

Although eating disorders can be viewed as a disease of affluence, there are considerable incidences of eating disorders in many populations of people worldwide (Pratt et al., 2003). Eating disorders tend to manifest themselves differently in racial/ethnic minority populations as compared with their European-American counterparts. It has been reported that racial/ethnic minority populations tend to have a lower level of "compensatory behaviors" such as dieting, purging, and excessive exercise, but are more likely to engage in binge eating and be diagnosed with partial eating syndromes (Pratt et al.). In a population-based study on dieting behaviors and body image perceptions of adolescents in Minnesota, population-specific differences were found among different racial/ethnic groups; SES was also found to be a factor. Story, French, Resnick, and Blum (1995) found that, in general, unhealthy weight control behaviors were not found just in White females of high SES. African American male and female adolescents were more likely to report being satisfied with their bodies, but also reported higher rates of vomiting as compared with their White counterparts. Asian females reported the highest frequency of binge eating and out-of-control eating, yet at the same time, Asian females were the least likely (along with African American females) to view themselves as overweight. As compared with White males, Asian

males reported more binge eating, out-of-control eating, and dieting in the past year. Hispanic females reported the highest prevalence of frequent dieting and use of laxatives or other diuretics to lose weight. Additionally, when looking at SES, there were significant differences between females of low, middle, and high SES. Females of lower SES reported less frequent dieting and were less likely to view themselves as overweight, but reported more intentional vomiting and use of diuretics to lose weight as compared with females of middle SES. In addition, females of higher SES reported less binge eating or vomiting and were more likely to report feeling proud of their bodies. In the discussion section, Story et al. (1995) presented the caveat that the measures used in this study were validated on Caucasian populations and it is unknown if these unmodified measures were used appropriately within the other populations. It appears that we continue to have a vague understanding of how adolescents of racial/ethnic groups view and understand disordered eating as well as the manifestation of eating disorders in racial/ethnic minorities and individuals of lower SES as compared with their White, middle/upper-class adolescents.

Although school counselors and other educators are typically not immediately involved in all aspects of eating disorder treatment, they become extremely important in aiding prevention efforts and in facilitating appropriate school conditions for children/adolescents who are in treatment for eating disorders. First of all, school counselors and other educators have the tremendous asset of spending large amounts of time with youth. This places them in an ideal context to model healthy body image, eating, and exercise routines. Additionally, they are in an ideal situation to see early signs of the disorders as they develop. Early detection of eating disorders can make the recovery much more successful (Rome et al., 2003). If a counselor or school educator believes that a child may have an eating disorder, the following strategies can be used to facilitate the process of helping the child and his/her family receive treatment (Manley, Rickson, & Standeven, 2000):

- Express concern to the student and a willingness to help, while still respecting his or her need for autonomy and privacy
- Do not force the student to eat
- Observe, describe, and document behaviors of concern across times and settings
- Find out where to go for support and encourage the student to seek help
- Consult with parents and the child on an information-sharing basis
- Consult with the school-based team regarding referrals to other experienced professionals for a thorough assessment.

Treatment for eating disorders takes place in both inpatient and outpatient settings. Therefore, students may be away from school for a large part of their treatment, or they may be attending classes while part of an outpatient program. School counselors and other school staff need to create an individualized plan for students' diagnosed with eating disorders to meet their emotional, educational, physical, and social needs while in school. This may include creating an individualized education plan (IEP) for the student, which can aid him or her in catching up on missed classes and provide physical education that is appropriate for his or her current health (Manley et al., 2000). Additionally, it is extremely important for educators to establish a healthy social environment for students which encourages students to find a support network within the school and involves a no-tolerance policy on weight-based harassment (Manley et al.).

Although many schools have good intentions in attempting to create a school environment that fosters healthy physical and emotional development, for many students diagnosed with eating disorders, school contexts can be extremely toxic and harmful to their recovery (Rich & Evans, 2005). In a qualitative study on the challenges of British adolescents who had been diagnosed with eating disorders, Rich and Evans described the many struggles that these students met when returning to school. Many students discussed how their private struggles with an eating disorder became very public knowledge to teachers and students at the school. The comments that many well-meaning teachers made were hurtful to these students in the recovery process. One student discussed returning from an outpatient unit during the sixth grade and remarked that the first time a teacher saw her in the hallway, he shouted across the corridor, "Are you putting on weight?" Another student remarked that while she was in line at the cafeteria, a teacher remarked, "Well, Hayley, is this really you in a queue for food?" The identities of these students end up being tied up in the sheer fact that they have an eating disorder (Rich & Evans). The school environment can be an extremely difficult context for a student to establish a different identity than the "anorexic" and to manage a successful recovery.

School-Based Prevention Efforts in Obesity and Eating Disorders Because obesity and eating disorders are difficult to treat (Power, Lake, & Cole, 1997; Pratt et al., 2003), prevention efforts are extremely important, particularly for children and adolescents. Although researchers are developing more effective weight-loss treatments, overall, these treatments tend to be costly, can be dangerous, and may have limited time-based effects. Additionally, due to the high mortality rate of anorexia nervosa and the limited success in treatment, it becomes particularly beneficial to

prevent eating disorders. It is extremely important, therefore, to raise children in a culture of physical health that includes frequent physical exercise, limited inactive leisure time, and healthy food intake, along with developmentally appropriate discussions of healthy weight levels and the impact of the media on our societal perpetuation of the thin ideal. By making healthy lifestyle choices routine and enjoyable for youth, it is presumed that they will continue to maintain these lifestyle choices into adulthood.

One of the challenges to effective weight-related health education is to teach extremely complicated lessons about weight-related health to children and adolescents, while also reaching them at a developmentally appropriate level. It can be difficult to work with younger students in particular, who may more easily create concrete associations of fat as being "bad" and thin as being "good." Therefore, educators need to be extremely savvy in their approach to working with younger children so as not to perpetuate cultural stereotypes about weight. Additionally, as children age and become more complex in their thinking, educators are given an opportunity to encourage children to think more abstractly about weight-related health, which will better help them to understand the complexities regarding these issues. It is hoped that if children are exposed to effective weight-related school-based interventions as they age, they will be more knowledgeable and prepared to understand the idiosyncrasies and current societal issues around weight and also to maintain a healthy weight into adulthood.

Since schools are one of the primary contexts in which most youth spend a large portion of their time, school communities are an ideal location to address healthy lifestyle choices that include obesity/eating-disorder prevention. Although many schools have high aspirations for adequately addressing the healthy physical development of their students, many fall short of creating an environment that facilitates healthy lifestyles. First, many educators report a lack of training in obesity/eating disorder prevention (Neumark-Sztainer, Story, & Harris, 1999). Although many teachers, counselors, coaches, and school nurses report an interest in acquiring more knowledge, few schools are providing these resources for their staff (Neumark-Sztainer et al.). Second, although attempts to establish effective school-based prevention efforts may be made in schools, occasionally, these uninformed attempts can be harmful to students. This may be due to curriculum choices (e.g., one that promotes an unhealthy body size and perpetuates the thin ideal). Curricula that promote these negative cultural images may sanction negative labeling of children who are overweight and lead students to make unhealthy drastic weight-loss choices such as enacting excessive food restrictions or vomiting (Yager & O'Dea, 2005). Additionally, individual educators can also be harmful to youth when they advertently (or inadvertently) promote drastic weight loss as the "ideal" picture of health or provide outdated weight loss prescriptions to overweight adolescents (those that focus only on decreasing caloric intake and increasing physical activity while ignoring genetic factors; Yager & O'Dea). It becomes extremely important for schools to correctly choose evidence-based programs that effectively teach students about healthy eating and exercise behaviors and also ensure that the educators who are delivering these materials correctly promote the curriculum through their teaching and role modeling.

The Centers for Disease Control (CDC) and other organizations have taken an active role in providing schools with assistance in developing their own prevention programs for obesity and eating disorders prevention. Many resources are now available for educators online, with assistance for implementing programs within schools and school districts. For instance, the CDC has published 10 guidelines that are most likely to promote lifetime healthy eating and physical activity in students (CDC, 1997; see also Wechsler, McKenna, Lee, & Dietz, 2004):

1. Address physical activity and nutrition through a Coordinated School Health Program (CSHP) approach
2. Designate a school health coordinator and maintain an active school health council
3. Assess the school's health policies and programs and develop a plan for improvement
4. Strengthen the school's nutrition and physical activity policies
5. Implement a high-quality health promotion program for school staff
6. Implement a high-quality course of study in health education
7. Implement a high-quality course for students in physical education
8. Increase opportunities for students to engage in physical activity
9. Implement a quality school meals program
10. Ensure that students have appealing, healthy choices in foods and beverages offered outside the school meals program.

The most effective curricula are "skill-based" programs that teach skills to adopt healthy behaviors, promote the practice and mastery of these skills, and aid students in overcoming barriers to achieving these skills (Wechsler et al., 2004). An important role for the school counselor in this process is in the evaluation of the effectiveness of existing programs. Often, the provider of the curriculum is focused on the transmission of content, so it is the school counselor who is in position to evaluate how well the curriculum translates into behavior. As changes in the school counsel-

ing program (see C. Dahir, chapter 3, this volume) call for school counselors to take an advocacy and leadership role, a focus on the acquisition of skills related to healthy behavior is certainly an important area of concern.

Many educators and schools are overwhelmed with education funding cuts and additional work responsibilities that have been added due to the demands of the "No Child Left Behind" legislation. It appears that schools are feeling pressure to cut program areas such as prevention programs and physical education in an effort to allocate more funding for required standardized testing and programs to improve student standardized test scores. These legitimate, pressing demands can be rationales for schools to reject plans of implementing school health programs and allocating additional resources to obesity and eating disorders prevention. It can be argued, however, that schools are required not only to educate and develop the minds of young learners, but also to teach youth skills in developing healthy bodies as well. Additionally, it has been shown that physically healthy (i.e., active and nutritionally fed) youth are more prepared and better equipped to learn than those who are not healthy (Chan, 2002; King et al., 2005). Therefore, it can be a tremendous asset for student learners when their schools provide them with adequate resources to reach optimum physical health. One way to address this challenge is to avoid the either/or thinking too common in schools. Rather than having to choose between socioemotional skill development and academics, addressing health issues such as nutrition can be integrated across the curriculum. For example, a seventh-grade curriculum might be an ideal time to address issues of assertion in guidance, nutrition in health class, exercise in physical education, gender images in social studies, self-image in English, and the underlying biology of nutrition in science class. Such an integrated curriculum would enhance the learning experience.

Additionally, many educators and school counselors feel overwhelmed regarding the prospect of treating children and adolescents with weight-related conditions. It is extremely important, however, to remind educators of their role in weight-related health condition prevention and treatment. Schools can be adequately trained to aid in the *prevention* of obesity and eating disorders, but not in the *treatment* of these diseases. It is not a school counselor's role to treat anorexia in a ninth grader or the physical education teacher's responsibility to prescribe a weight-loss treatment program for an overweight third grader. Instead, educators serve the role of teaching students about how to live healthy lives and teaching behavioral skills that students can use to achieve lifetime physical health. Additionally, educators play the important role of referring students who are struggling with weight-related conditions to the appropriate community resources for treatment (e.g., counselors, pediatricians, nutritionists) This role clarification allows educators to help struggling students within the scope of their training and expertise.

In addition to the CDC and other national organizations, many additional programs are being implemented in schools. The American Indian community has seen a high prevalence of overweight and obesity (Story et al., 2003). In an attempt to lower the percentage of body fat of American Indian children, a culturally grounded, large-scale, multi-site, school-based intervention entitled "Pathways" was implemented in 21 schools. The curriculum components included (1) a culturally based classroom curriculum designed to encourage healthy eating and increase physical activity, (2) a physical activity piece that emphasized maximum energy expenditure during physical education classes, (3) a food service component which intended to lower the amount of fat in school meals, and (4) a family program that contained take-home information for parents and encouraged them to prepare lower fat meals and promote exercise in their children (Steckler et al., 2003). School personnel (including food service staff) at the intervention schools were trained in the curriculum. In comparison with students at control schools (who were not involved in the Pathways intervention), the students exposed to the Pathways curriculum had an increase in healthy food intentions (intentions to choose more healthy foods over less healthy foods) and participation in physically active behaviors (J. Stevens et al.). Additionally, knowledge of messages about nutrition and physical activity increased in the intervention group (J. Stevens et al., 2003). The children involved in Pathways reported a significant decrease in the mean percentage of calories from total fat and saturated fat consumed in school lunches, and they reported a significant increase in the percentage of total calories from carbohydrates as compared with the control group (Himes et al., 2003). In looking at self-efficacy, girls were more efficacious to be physically active in the intervention group as compared with the control group, but this did not change for boys (J. Stevens et al.). Additionally, there were no differences between the intervention and control groups regarding student self-efficacy to make more healthy food choices (J. Stevens et al.). Finally, perception of healthy body size and weight-loss attempts did not demonstrate differences between intervention and control groups (J. Stevens et al.). Overall, it appears that the Pathways intervention was moderately successful in changing the eating behaviors and physical activity behaviors of American Indian students within a school context.

School-Based Health Centers

School-based health centers (SBHCs; also called coordinated school health programs) are clinics located in

schools that provide students with comprehensive physical and mental health services. Students who receive parental consent are able to receive care for basic health needs such as annual physicals, immunizations, asthma care, sexually transmitted infection treatment, smoking cessation behavioral interventions, and preventative counseling for various health issues. SBHCs are staffed by qualified health professionals such as nurse practitioners, physicians, social workers, and counselors. In a 2002 survey, there were 1498 SBHCs in the United States (Center for Health and Health Care in Schools, 2002). Many experts agree that SBHCs are an effective means to increase health literacy in students, reach student populations that do not have a primary source of care, and provide effective preventative health services for children.

There are eight basic components of effective coordinated school health programs (CSHPs): (1) health services; (2) counseling, psychological, and social services; (3) health education; (4) health promotion for staff; (5) healthy school environment; (6) nutrition services; (7) physical education; and (8) family/community involvement (C. Fisher et al., 2004). Organization of these programs typically comes from a state and community level. Many CSHPs have advisory boards that include teachers, school nurses, school principals, coaches, parents, and students to ensure that the CSHP is meeting the needs of the community. Funding for these programs includes federal, state, and private grants. Additionally, some CSHPs are able to receive payment through managed care and Medicaid.

Parents, students, and schools benefit from establishing SBHCs in their schools. First, it has been hypothesized that healthy students are more effective in the classroom than unhealthy students are. By providing all students with access to quality health care, students are better able to maintain good to excellent physical and mental health, which can have an impact on their academic performance (Geierstanger, Amaral, Mansour, & Walters, 2004). Next, SBHCs provide a convenient place for students to receive access to health care. By providing quality health care in schools, parents are able to avoid taking time off from work to transport children to physician's appointments. Additionally, since transportation time is not an issue, students are able to miss less classroom instruction time. Finally, many SBHCs are located in urban areas with higher physician-to-child ratios (Center for Health and Health Care in Schools, 2002). By coordinating with the community to establish health care for students in schools, it is likely that more underserved students will have access to health care, particularly in these areas with few available pediatricians (Center for Health and Health Care in Schools).

Effectiveness of School-Based Health Centers

Many schools have found measurable benefits from implementing SBHCs in their schools. For instance, after implementing an SBHC in a middle school in Florida, the school reported that school attendance increased from 92.1% to 94.2%, the percentage of students scoring above a 3.0 on a Florida writing exam increased from 86% to 99%, the percentage of students scoring above the 50th percentile on a mathematics standardized test increased from 69% to 79%, and the number of disciplinary actions of students was reduced (Marx, 2003). Although SBHCs account for only a portion of the multiple interventions used to aid students in succeeding academically, they can provide a service that allows students to become healthier and thus improve the likelihood that they will succeed in school. A quote from Jackson, Davis, Abeel, & Bordonaro (2000), *Turning Points*, demonstates the focal idea, "Good health does not guarantee that students will be interested in learning and able to learn, but the absence of good health makes learning all the more difficult" (pp. 168–169). Therefore, in the advent of a time when schools are required to demonstrate the use and benefit of every dollar spent within school systems, researchers have begun to conduct studies that show the effectiveness of SBHCs.

Health related impacts of school-based health centers. It has been demonstrated that students who have access to SBHCs at the elementary school level are more likely to see a health professional and receive higher quality care. Kaplan et al. (1999) conducted a comparison study between students at a school that had an SBHC and a neighboring comparison school that did not. Both schools enrolled children who were from large households, had parents with lower education levels, and were receiving high levels of public assistance, and about half of the students did not have health insurance. They found that students who had access to the SBHCs had significantly less difficulty receiving physical health care, used emergency departments less frequently, were more likely to have seen a physician in the past year, and were more likely to have had an annual dental exam. SBHCs can be a very effective method to provide elementary students with access to quality physical health care.

Additionally, SBHCs have been shown to be very effective in working with children who have asthma. In a longitudinal study conducted from 1997 to 2003, researchers found that children with asthma who received care within the context of a SBHC were less likely to be hospitalized (due to asthma complications) and were less likely to make emergency room visits as compared with children in non-SBHC schools (Guo et al., 2005). Additionally, Guo et al. estimated that the potential cost-savings for hospitalization

per child was $970. In a another study on the impact of SBHCs on children with asthma, researchers found that children with access to SBHCs in the Bronx, New York, had a reduction in hospitalizations and gained 3 school days in comparison with children who did not have an SBHC (Webber et al., 2003). Overall, it has been shown that SBHCs are able to provide both quality and cost-effective care for children with asthma.

Academic impacts of school-based health centers. The evaluation of the impacts of SBHCs continues to be a challenge for many school districts. Although many school districts intuitively believe that their programs are making an impact on students' academic performance, there continue to be insufficient well-conducted quantitative studies that demonstrate this relationship (Geierstanger et al., 2004). In a review of the literature on the relationship between SBHCs and academic performance, Geierstanger and colleagues found seven studies that met the methodological qualifications for studies that used an experimental or quasi-experimental design and were published in peer-reviewed journals. Of these seven studies, six found a statistically significant relationship between at least one academic indicator (i.e., absence/attendance, tardiness, promotion to the next grade, withdrawal/drop-out rates, graduation rates, disciplinary referrals, suspension rates, standardized test scores, GPA, educational motivation, receipt of failing grade, educational aspirations, or credit accumulation) and the presence or use of a SBHC. They concluded that although there continues to be insufficient evidence regarding the direct link between SBHC and positive academic performance outcomes, the intermediate outcomes of SBHCs along with other social or educational factors can influence academic performance indirectly (Geierstanger et al., 2004).

In a similar review of the same seven studies on the relationship between SBHCs and academic performance, the National Assembly on School-Based Health Care (Geierstanger & Amaral, 2005) also concluded that it is difficult to establish a direct link between SBHCs and academic performance. Additionally, some individuals on the committee argued that because SBHCs are not a direct educational intervention, they should not be held responsible for directly accounting for the educational performance of students. They wrote that due to the idea that SBHCs are primarily created to impact student health, any benefits to academic performance should be seen as secondary. The committee also acknowledged, however, that schools are being held to increasingly higher standards to demonstrate where their dollars are being spent, and that if SBHCs cannot demonstrate a direct link between their presence in schools and the effects of academic achievement, that it will be difficult to rationalize the funding of these programs. In the end, the committee also communicated a great need to improve the methodological design in studies used to demonstrate the relationship between SBHCs and academic outcomes (Geierstanger & Amaral). It is currently unclear if more rigorous studies of SBHCs will demonstrate significant, direct links between SBHCs and academic outcomes. More importantly, it may be more advantageous for SBHCs in the long run to argue for their inclusion in school programs as an indirect influence on academic performance and as being an integral component of the development of the whole student with both mind and body included.

Implementation of school-based health centers. School counselors can be instrumental in establishing SBHCs in their schools. By networking with other individuals in their community (including superintendents, principals, teachers, parents, students, community leaders, etc.), school counselors can create a unified group that can lobby state and local leaders for support. Although many communities fear that establishing SBHCs is too expensive, there are many grants available through organizations such as the Centers for Disease Control's Division of Adolescent and School Health (CDC, 2005c). As key players in establishing prevention efforts within schools, counselors are able to work with the community to recognize how creating SBHCs can be more cost-effective in the long run.

Additionally, the CDC has created a free publication entitled *Stories from the Field: Lessons Learned about Building Coordinated School Health Programs* (Marx, 2003), which aids educators in adopting, initiating, implementing, and institutionalizing SBHCs in their schools. In addition to a practical implementation guide, this publication tells the stories of nine school districts across the country who successfully implemented SBHCs in their communities. This publication can be an extremely helpful resource for communities looking to address physical and mental health issues in their schools.

Ultimately, the creation of SBHCs in schools is highly dependent on funding and those organizations that contribute to the payment for health based services. Because health care tends to be funded primarily through Health Management Organizations (HMOs), national programs (e.g., Medicaid), and personal contributions, if schools are to implement SBHCs, it would be necessary to encounter means to provide services that would be covered by various payment entities. This is a potential barrier to the establishment of SBHCs in some areas, which may need to be addressed at a state policy level. Regardless of the ultimate method of delivery, it is important for schools to find a means to coordinate how to effectively meet the physical and emotional health needs of students in schools.

Conclusions

School counselors and other educators are being required to have increased influence over the physical health of their students. This additional responsibility is a reality that requires that educators have access to appropriate training and funding for these school programs that address physical health issues. It is hoped that by increasing physical health based prevention programs in school, children will be less likely to suffer from preventable physical health conditions and that they will be better prepared to learn and succeed academically. School counselors can be excellent resources in schools to help address, advocate for, plan, implement, and evaluate school health initiatives. Through coordinated school health efforts, which may include school-based health centers (SBHCs), schools can be at least one environmental context that is concerned with not only the successful mental and social development of youth, but also their optimal physical development as well.

XVII
ADOLESCENT SEXUAL HEALTH AND DEVELOPMENT

LAURA FILLINGAME KNUDTSON AND HARDIN L. K. COLEMAN
University of Wisconsin–Madison

Currently, one of the most controversial topics regarding adolescent physical health is sexuality. Parents, educators, counselors, physicians, and youth leaders continue to struggle with issues around adolescent sexuality including but not limited to abstinence-only versus comprehensive sex education, the role of schools versus parents in sexual health education, minors' rights in consenting to receive sexual health services and/or birth control, the role of religion/spirituality in sexual health, communicating with adolescents about sexuality, and our nation's overwhelming discomfort in talking about sex. The politically charged nature of the topic of adolescent sexual health can be particularly challenging for school counselors and other school personnel who readily observe the developmental changes of middle and high school students and become closely integrated into adolescents' negotiation of this challenging developmental milestone, but are increasingly meeting roadblocks in how they are allowed to be involved in the life transition of sexual development in their students. Although, states differ in their legal requirements around sexual health education, this chapter can aid school personnel in understanding the issues around adolescent sexual health and then applying the information to their current state's legal statutes about counselors' and educators' roles in sexual health education and counseling. (The Alan Guttmacher Institute has excellent fact sheets on state specific policies on sex education and minor access to contraception, STI treatment, abortion, etc., available at http://www.guttmacher.org/statecenter/spibs/index.html.) Additionally, this chapter will provide information about coordinated school-based health centers as a beneficial addition to school programs that address issues of adolescent physical and sexual health.

Current State of Adolescent Sexual Behaviors

The state of adolescent sexual behaviors has changed over the past 12 years in the United States. The number of teens who have *never* had sexual intercourse is declining (from 54.1%, CI [confidence interval]: ±3.5%, in 1991 to 46.7%, CI: ±2.6%, in 2003) and continues to be a significant issue for almost half of all adolescents (Centers for Disease Control and Prevention [CDC], 2005b). See Table 17.1 for racial-/ethnic-specific rates for adolescents who have reported having sexual intercourse. Every year about 1 million teens become pregnant (which is about 10% of all women aged 15 to 19; Alan Guttmacher Institute, 1999). The teen pregnancy rate in the United States has declined (Singh & Darroch, 2000). However, the United States continues to lag behind other developed nations regarding adolescent pregnancy, abortion, and birth rates. See Table 17.2 for pregnancy, abortion, and birth rates as reported per 1,000 adolescents aged 15 to 19. See Table 17.3 for race/ethnic pregnancy and birth rates in the Unites States and Table 17.4 for information on pregnancies and out-of-wedlock births for adolescents under age 20. It is estimated that 78% of teen pregnancies are unplanned (Alan Guttmacher Institute, 1999). This is a major health issue, as adolescent pregnancy carries with it many risks. One third of pregnant teen mothers receive inadequate prenatal care. Babies born to adolescent mothers are more likely to be of low birth weight, to have childhood health problems, and to be hospitalized than are babies born to older mothers. Additionally, adolescent mothers are less likely than nonparenting teens to go on to college (Alan Guttmacher Institute). As compared

Table 17.1 Race-/Ethnic- and Gender-Specific Percentages of Teens That Report Ever Having Sexual Intercourse

Race	Percentage of Teens (15–19) Who Report Ever Having Sexual Intercourse	
	Female	**Male**
African American	60% (1995)	80% (1995)
Asian/Pacific Islander	27.9% (aggregate)[a]	28.5% (aggregate)[a]
Caucasian	50% (1995)	50% (1995)
Latino	56% (1995)	61% (1995)
Native American	52.3% (2001)[b]	65.5% (2001)[b]
Total—All Youth	51% (1995)	55% (1995)

[a] Combined data from the 1991, 1993, 1995, 1997 Youth Risk Behavior Surveys—due to small sample size of Asian/Pacific Islander students. [b]Survey conducted by the Bureau of Indian Affairs in 2001. National percentages were reported as 42.9% for females and 48.5% for male adolescents in 2001. From National Campaign to Prevent Teen Pregnancy, 2004a, 2004b, 2004c, 2005b.

Table 17.2 Developed Nations' Adolescent Pregnancy, Abortion, and Birth Rates (per 1000 adolescents aged 15–19 years)

Nation	Pregnancy Rate	Abortion Rate	Birth Rate
Australia (Singh & Darroch, 2000)	43.7	19.8	23.8
Canada (WHO, 2004)	45.4	21.2	24.2
Denmark (WHO, 2004)	Not reported	14.4	8.3
Finland (WHO, 2004)	Not reported	10.7	9.8
United Kingdom (WHO, 2004)	46.9	18.6	28.4
United States (Singh & Darroch, 2000)	83.6	29.2	54.4

Note: From World Health Organization. (2004). *Adolescent pregnancy: Issues in adolescent health and development.* Geneva, Switzerland: Author.

Table 17.3 Race-/Ethnic-Specific Pregnancy and Birth Rates in the United States (per 1000 youth surveyed)

Race	Pregnancy Rate (2000)[a]	Birth Rate (2002)
African American	153.3	66.6
Asian/Pacific Islander	Not available[b]	18.3
Caucasian	54.7	28.5
Latino	137.9	83.4
Native American	Not available[b]	53.8
Total—All Youth	83.6	43.0

Notes: [a] 2000—latest year available for pregnancy rates. [b] Not available due to lack of information on number of abortions. From National Campaign to Prevent Teen Pregnancy, 2004a, 2004b, 2004c, 2005b.

with adolescents of similar socioeconomic status, adolescent mothers are more likely than their nonparenting counterparts to end up on welfare (52% of women on welfare were teen mothers; National Campaign to Prevent Teen Pregnancy, 2002). The reality is that adolescents in the United States *are* engaging in sexual behaviors and although pregnancy rates are dropping, they continue to be much higher than other developed countries. We need to continue to promote greater adolescent sexual health awareness and effective interventions to align pregnancy, abortion, and birth rates more equally with other developed nations as well as to curb some of the inherent risks of adolescent pregnancy for youth.

Table 17.4 Race-/Ethnic-Specific Percentages of Teens Who Become Pregnant at Least Once by Age 20, and Percent of Teens Who Gave Birth out of Wedlock

Race	Percent that Become Pregnant at least Once by age 20	Percent of Teens that Give Birth Out of Wedlock (2001)
African American	57%	95.7%
Asian/Pacific Islander	Not available	71.5%
Caucasian	25%	75.4%
Latino	51%	73.9%
Native American	Not available	86.6%
Total—All Youth	35%	80%

Note: From National Campaign to Prevent Teen Pregnancy, 2004a, 2004b, 2004c, 2005b.

In addition to the number of adolescent births and abortions, adolescent sexual behaviors carry an increasing risk of acquiring sexually transmitted infections (STIs). Adolescents and young adults are at a higher risk for acquiring STIs than other adults are (CDC, 2003b). Every year, about 3 million (or 1 in 4) sexually experienced teens will acquire an STI (Alan Guttmacher Institute, 1999). In 2003 (and similarly in previous years), adolescent women aged 15 to 19 years had the highest gonorrhea rates at 634.7 cases per 100,000 females (CDC, 2003b). In adolescent males, aged 15 to 19 years, this rate was 262.4 per 100,000 males for gonorrhea in 2003 (CDC, 2003b). The *National Job Training Program* tracks chlamydia rates for young people entering their program (typically a diverse group of working class young people). In women entering the program in 2003, the median state-specific rate for chlamydia infection was 9.9% and for men was 7.8% (CDC, 2003b). Some studies report as many as 15% of sexually active teenage women have been infected with the human papillomavirus, which has been linked with cervical cancer (Alan Guttmacher Institute). In 2003, there were an estimated 7,081 adolescents and young adults aged 15 to 24 living with AIDS in the United States, which was a 37% increase in AIDS cases from 1999 (CDC, 2005a). Although it is unknown exactly how these youth acquired HIV/AIDS (e.g., unprotected sex, sharing needles, blood transfusion, perinatal transmission), it is likely that many of these youth acquired the AIDS virus through unprotected sexual behavior. African Americans are the largest group of young people affected with HIV, with 56% of all new HIV infections (CDC, 2004). Additionally, young men who have sex with men (particularly of minority racial/ethnic groups) are at a high risk of HIV infection (CDC, 2001). The inherent risks associated with adolescent sexual behavior continue to raise our concerns and additional interventions are needed to encourage safe sexual experiences for all adolescents.

Why Have Pregnancy Rates Dropped in the United States?

It is unknown exactly why national teen pregnancy rates have dropped. Overall, it appears that teens can take a large amount of credit for this decrease in adolescent pregnancy rates because they are making more educated and responsible decisions regarding their sexual health (Kirby, 2001). In addition to teens' making better choices, many programs have been established to encourage teens to practice abstinence or to use contraception if they have sex (Kirby). Although it is currently unclear exactly what has led to the drop in teen pregnancy rates, some researchers credit the greater use of contraception (e.g., condoms and birth control), while others credit delayed sexual behavior initiation for this decrease in births. In the end, it is probably a combination of these two concepts that have contributed to the decrease in adolescent pregnancies.

Racial/Ethnic Differences in Contraceptive Use

In 1991, the percentage of youth that reported using condoms at last intercourse was 46.2% (CI: ±3.3%) and, in 2003, it was 63% (CI: ±2.5%; CDC, 2005b). See Table 17.5 for information pertaining to adolescents' use of contraception at first and most recent intercourse and Table 17.6 for information pertaining to male adolescents' report of consistent use of condoms. Similarly, 17% (CI: ±2.3%) of adolescents reported using birth control pills in 2003 (CDC, 2005b). In an attempt to explain the current decline in teen pregnancy rates during the 1990s, Santelli et al. (2004) used data on estimated youth sexual activity and contraceptive use from the *National Youth Risk Behavior*

Table 17.5 Percent of Female Teens Who Used Contraception at First Intercourse and Most Recent Intercourse

Race	Percent of Female Teens Who Reported Using Contraception at First Intercourse (1995)	Percent of Females Who Reported Using Contraception at Last Intercourse (1995)
African American	68%	70%
Asian/Pacific Islander	Not available	49.9%
Caucasian	81%	71%
Latino	53%	52%
Native American	Not available	Not available
Total—All Youth	75%	68%

Note: National Campaign to Prevent Teen Pregnancy, 2004a, 2004b, 2004c, 2005b.

Survey along with method-specific contraceptive failure rates to estimate the degree to which delayed initiation and improved contraceptive practice contributed to the decline in teen pregnancy rates. Although Santelli et al. reported an almost equal contribution between delayed initiation and improved contraceptive practice, they also reported extremely large confidence intervals (CI: ±25%), which virtually rendered their results inconclusive as to the contribution of either factor (Constantine, 2004). However, when these data are examined looking at group specific outcomes over and above the pooled data, Santelli et al. found very different population specific data. They reported change rates in initiation as being a 16% decline for the combined group, 14% in the White group, 28% in the Black group, and no change in the Hispanic group (Santelli et al.). Additionally, the reported change rates in contraceptive method risk were 15% for the combined group, 9% among White teens, 20% among Black teens, and 24% among Hispanic teens (Santelli et al.). Apparently, it appears that larger change rates are taking place in specific ethnic groups (e.g., Black adolescents). It will be important for researchers to determine why specific ethnic groups are making greater changes over others and using this information, they may be able to determine how to target more focused interventions to specific populations. Additionally, school counselors will need to be knowledgeable about the ethnic characteristics of their students in order to adequately address the sexual health needs of their students.

Table 17.6 Percent of Male Adolescents Who Reported Consistent Use of Condoms (100% of the time)

Race	Percent of Male Teens Who Reported Using Condoms 100% of the Time (1995)
African American	47%
Asian/Pacific Islander	Not available
Caucasian	46%
Latino	29%
Native American	Not available
Total—All Youth	44%

Note: National Campaign to Prevent Teen Pregnancy, 2004a, 2004b, 2004c, 2005b.

Issues in Adolescent Sexual Health

What Is Considered "Sex" to Current Teens?

Although there is a broad scope of behaviors involved in the act of sex, many teens feel that sexual intercourse (vaginal/penile sex) is the only type of "real" sex. As Remez (2000) suggested, it appears that current youth and adults tend to equate sex with vaginal/penile sexual intercourse. In a study with Midwestern university students, 59% believed that oral sex was not "sex," and 19% believed that anal sex was not "sex" (Sanders & Reinisch, 1999). Therefore, engaging in oral and/or anal sex appears to be an option that youth believe will not get them pregnant, will not expose them to STIs, and will allow them to maintain "virgin" status.

However, many of these beliefs are myths that can have harmful consequences. There continue to be many inherent risks (e.g., STI and HIV/AIDS infection) that are involved in other noncoital sexual acts, including oral and anal sex. First, noncoital behaviors are seen as a gateway to further sexual experimentation (Smith & Udry, 1985). Although oral and anal sex may not be immediately involved in causing pregnancy, youth may be more likely to experiment with further sexual behaviors such as sexual intercourse. Furthermore, many STIs including gonorrhea, syphilis, chlamydia, human papillomavirus, herpes simplex virus, and hepatitis B can be transmitted through

oral and anal sex (CDC, 1999, 2000). It is rare to transmit HIV through oral sex (CDC, 2000), but relatively easy to transmit the HIV virus through anal sex (CDC, 2003a). Additionally, it is perceived that few if any teens or adults use dental dams or condoms when practicing noncoital sex. Boekeloo and Howard (2002) found that very few adolescents reported using barrier protection during oral sex. Finally, many sexual health curricula, sexual health educators, parents, and clergy have failed to define exactly what "sex" is for our youth. This may be out of fear that, if we define what sexual behavior is, we will be telling our youth how to engage in sex, and therefore, they will engage in sexual activity. However, without proper definitions of what "sex" is, it becomes difficult for youth to abstain from sex. Therefore, America's youth are creating their own definitions of what constitutes "sex," which is currently placing them at risk.

It is not only America's youth who struggle with defining sex and abstinence from sex. The definitions for what constitutes sex and abstaining from sex are largely dependent on the type of sexual health information taught (abstinence-only, comprehensive, religious-based, parental-only education) and an individual's critical analysis of personal beliefs. Even adults including sexual health educators struggle in determining a definition for abstinence from sex. In a 1999 survey, 30% of health educators believed that oral sex was abstinent behavior and 71% believed that mutual masturbation was abstinent behavior (Mercer, 1999, as cited in Remez, 2000). It appears that to work effectively with youth around issues of sexual health development, one of our goals, as school counselors and educators, is to define for ourselves what constitutes abstinence from sex and also encourage our schools and districts to reach a solid definition of abstinence that allows us to communicate with youth, other educators, and parents without confusion.

Oral Sex Prevalence in the Teen Population

It is presumed that teens are engaging in unprotected oral and anal sex. However, due to the controversial nature of asking teens about these sexual behaviors, there is little research available on the prevalence of oral and no specific research on anal sex in the teen population (Remez, 2000). In a recent study of ethnically diverse 9th graders, more participants reported ever having oral sex (19.6%) than vaginal sex (13.5%) and more participants reported intending to have oral sex (31.5%) than vaginal sex (26.3%) in the next 6 months (Halpern-Felsher, Cornell, Kropp, & Tschann, 2005). Additionally, these participants found oral sex to be significantly less risky, to be more acceptable than vaginal sex among their peers, and to be less of a threat to their values/beliefs (Halpern-Felsher et al.). In a retrospective study on college students, over 50% of participants reported engaging in fellatio or cunnilingus prior to their first experience with vaginal intercourse (Schwartz, 1999). Finally, there tends to be a difference in the engagement of Black and White adolescents in noncoital sexual behaviors (e.g., oral sex). Smith and Udry (1985) found that Whites were more likely than Blacks to engage in a predictable series of noncoital behaviors before their first vaginal intercourse. Although no recent studies have been conducted in this area, there may be differences in the amount that certain racial groups engage in noncoital behaviors prior to first sexual intercourse. Overall, it appears that adolescents are engaging in noncoital behaviors prior to first intercourse, but little is known regarding the specifics of these behaviors.

Anal Sex

Overall, there is very limited data on the prevalence and characteristics of anal sex in adolescents. There are many reasons regarding this limited research body. First, anal sex tends to be considered very taboo in our society (Remez, 2000). Adults are very uncomfortable talking about anal sex and adolescents tend to avoid discussing anal sex as well. Second, anal sex tends to be attributed to a sexual behavior that takes place only between men who have sex with men in our society. Therefore, many individuals assume that only gay men have anal sex, even though anal sex is a sexual behavior that is not solely attributed to a particular sexual identification. Men who have sex with men (but may not identify as gay) have anal sex as well as men who have sex with women, and so forth. For people who are uncomfortable or unfamiliar with same-sex sexual behaviors, there can be a tendency to consider anal sex wrong because they associate it with homosexuality. Finally, since anal sex continues to be such a difficult topic to discuss in our society, many human subject review panels, parents, and schools are reluctant to allow researchers to ask adolescents questions about anal sex. Therefore, the majority of our research on anal sex revolves around adult men who have sex with men and HIV/AIDS prevention research.

In a study on anal sex in heterosexual college students, Baldwin and Baldwin (2000) found that 22.9% of nonvirgins indicated that they had engaged in anal intercourse. These students reported using condoms during anal intercourse 20.9% of the time as compared with 42.9% of the time with vaginal intercourse. Finally, individuals in the study who had engaged in anal intercourse were more likely to report having had at least one STI and having had been tested for HIV as compared with those that did not report having anal intercourse. Although many individuals feel that anal intercourse is prevalent only in gay communities, it is apparent that both heterosexual and gay/

lesbian/bisexual students need to be educated regarding the risks of anal intercourse.

When Does Sexual Initiation Occur for Teens?

Although the majority of school-based sexual health programs begin to teach students about abstinence, teen pregnancy, contraception, and STIs in the ninth-grade year, many teens report having initiated sexual behaviors prior to their ninth-grade year. One in five teens reported having had sex before age 15 (National Campaign to Prevent Teen Pregnancy, 2003d). Additionally, the percentage of adolescents in the United States who reported having engaged in sexual intercourse before the age of 13 was 7.4% (CI: ±1.2%) in 2003 (Grunbaum et al., 2002). Although the majority of adults (and teens) do not believe that young adolescents are prepared to be sexually active (Moore & Stief, 1991; National Campaign to Prevent Teen Pregnancy, 2004d, 2005a), many are engaging in sexual behaviors at very early ages.

Since around half of all teens will have sex prior to graduating from high school, where are they having sex? It appears that the majority of 16- to 18-year-olds who reported having sex for the first time in 2000 are having sex in their family's home, in their partner's family home, or in a friend's home (National Campaign to Prevent Teen Pregnancy, 2003e). Additionally, much smaller numbers reported having sex in their own home/partner's home (e.g., apartment, dorm room), in a car or truck, in a hotel or motel, in a park or outdoors, or somewhere else. Most teens (70%) report that their first sex occurred in the evening or nighttime. However, African American teens were more likely to have sex during the late afternoon hours than other racial/ethnic groups were. There do not seem to be any significant seasonal differences in when teens first initiate sex (National Campaign to Prevent Teen Pregnancy, 2003e). Overall, it appears that most teens are engaging in sex in their family's home (or partner or friend's home) and that first sex appears to be taking place in the evening hours (possibly when parents are present). It has been shown that first sexual experience increases with the number of hours teens spend unsupervised (Cohen, Farley, Taylor, Martin, & Schuster, 2002). Therefore, prevention efforts may be directed at structuring more afternoon and evening times when teens are involved in adult-mediated activities.

What are the first sexual partners of adolescents typically like? Many teens report that their first sexual partners was a friend first (National Campaign to Prevent Teen Pregnancy, 2003c). Additionally, teens report having met their first sexual partners at school or a place of worship. Few teens report that their first sexual partners were strangers. Most teens report having participated in "couple-like" behavior (e.g., going out together in a group, going out together alone, meeting their partners' parents, thinking of themselves as a couple, telling others that they were a couple, exchanging presents, and exchanging the words "I love you") prior to their first sexual experience. This percentage is higher for non-Hispanic White and Hispanic teens than African American teens. Additionally, most adolescents reported having engaged in intimate behavior with their partners (i.e., kissing, holding hands, and touching each other under clothes or with no clothes on) prior to their first sex. The majority of teens (69%) reported having touched their partners' genitals before having sex for the first time. In looking at contraception, 40% of adolescents surveyed never discussed contraception with their partners before having sex for the first time. Adolescents who reported engaging in more couple-like behaviors were more likely to discuss contraception prior to sex as compared with those that did not. Finally, teens who had sex at or before 14 years of age reported less couple-like activity and were less likely to discuss contraception with their partners (National Campaign to Prevent Teen Pregnancy, 2003c). Overall, it appears that teens who engage in couple-like behaviors with their partners appear to have better communication skills with their partners and may feel more comfortable talking with their partners about contraception.

Early sexual initiation in adolescents is correlated with some other health risk behaviors. For teens who were sexually active before the age of 13 in 1991, fighting, carrying a weapon to school, and early experimentation with cigarettes and alcohol were associated with early sexual activity (Coker et al., 1994). Additionally, Coker et al. found that those teens who initiated sex early had a greater number of sexual partners, were 50% less likely to use condoms, and were more likely to have been pregnant or have caused a pregnancy, and females who initiated sex early were more likely to have had an STI. For those teens who are initiating sex prior to age 13, it is apparent that they are likely to be engaging in other health risk-taking behaviors and that they are less likely to have received formal education about health behaviors. It seems that, to reach this population of adolescents, sexual health education needs to take place prior to age 13.

Alcohol and Teen Pregnancy

When looking at risk factors for sexual risk taking and teen pregnancy, many studies have pointed to the possible risk of using alcohol prior to sex as decreasing the

likelihood that adolescents will act responsibly (i.e., use protection) during intercourse (Biglan, Metzler, Wirt, & Ary, 1990; Gold & Skinner, 1992; Hingson, Strunin, Berlin, & Heeren, 1990; McEwan, McCallum, Bhopal, & Madhok, 1992; Mott & Haurin, 1988; Robertson & Plant, 1988; Rotherham-Borus et al., 1994). This is based upon the hypothesis that adolescents who are drinking will be unable to behave responsibly while affected by alcohol and also that adolescents who engage in underage drinking are more likely to be risk takers overall and, thus, are more likely to take risks in sexual behavior as well. Additionally, other researchers have pointed to the probability that adolescents will be more likely to be victimized sexually when alcohol has been used by the perpetrator or the victim. Champion et al. (2004) found that both binge drinking in the past 2 weeks and age of first drink were associated with sexual victimization (among females). However, other studies have found no association between alcohol use and sexual risk taking (Fergusson & Lynskey, 1996; Fortenberry & Orr, 1997; Halpern-Felsher, Millstein, & Ellen, 1996; Lowry et al., 1994; Santelli, Robin, Brener, & Lowry, 2001). In a study on adolescents with a high level of sexual risk taking, rates of condom use did not differ significantly between sexual events that were preceded by drinking (use in 54% of events) versus those that did not (use in 52% of events; Morrison et al., 2003). It appears that few conclusive findings have demonstrated that adolescent alcohol use conclusively diminishes the likelihood that adolescents will engage in protected sexual encounters. Additionally, the data on middle school and high school students suggest that sexual activity occurs within ongoing intimate relationships (National Campaign to Prevent Teen Pregnancy, 2003c). Although, researchers and youth workers should continue to be concerned about ensuring that adolescents have the knowledge and skills necessary to decrease involuntary sexual experiences, educational efforts also should focus around the likely perception that intercourse is more likely to be a natural progression within a relationship.

Sexual Identity Development of Gay, Lesbian, and Bisexual Teens

The majority of research on adolescent sexual health tends to be on adolescents who identify as heterosexual or the researchers make assumptions that all adolescents in the sample identify as heterosexual. However, a small population of teens identifies as gay or bisexual and/or have sex with same-sex partners. This population tends to be overlooked in research even though many adolescents and adults who have sex with same-sex partners engage in sexual risk-taking behaviors (CDC, 2001). Particularly, in an adolescent population where sexual identity development is an evolving process, many adolescents may choose to have sex with same-sex partners and not identify as gay/lesbian/bisexual, while other adolescents who will later identify as gay/lesbian/bisexual will choose to have sex with the opposite sex. Sexual identification does not necessarily predict behavior in adults and is particularly inaccurate among adolescents. Given the nature of the evolving process of sexual identity development in adolescence, school counselors and other educators need to be aware of the fluid process of sexual identity to work with this population of youth appropriately.

How Are Religious Teens Different From Teens Who Are Not Religiously Identified in Terms of Sexual Behavior?

Since sexual behavior tends to be largely tied to values and morals in the United States, many researchers have turned to the role of religion in sexual behavior to understand why some adolescents tend to delay sexual intercourse and others do not. Multiple studies have found that adolescents that identify as being religious and attend religious services frequently are at a reduced likelihood of engaging in sexual intercourse (Billy, Brewster, & Grady, 1994; Brewster, Cooksey, Guilkey, & Rindfuss, 1998; Resnick et al., 1997; Thornton & Camburn, 1989). Additionally, Brewster (1994) found that women without a preidentified religious affiliation are at a greater risk of engaging in sexual intercourse than are mainline Protestants.

Although it appears that there is a connection between religiousness in adolescents and delayed first intercourse, not all studies have found this conclusion. Meier (2003) found that there was only an effect of religiosity on first sex for females and that over and above religiosity, personal and relational attitudes about sex (cost/benefits of sex) were more influential for both males and females. Miller and Gur (2002) found that the personal devotion (i.e., an adolescent's sense of personal connection to God) was positively associated with decreased risk of sexual activity outside of a romantic relationship. Personal devotion and attendance at religious events were found to be associated with sexual responsibility. Additionally, they found that personal devotion, institutional conservatism, and participation in religious events were associated with decreased number of sexual partners in the last year. However, they found that no dimension of religiousness (e.g., personal devotion, institutional conservatism, personal conservatism, and participation in religious events) was associated with a decreased likelihood of sexual intercourse. Additionally, they found a marginally significant trend that personal conservatism (i.e., a close or rigid adherence to

religious creed) actually posed a risk for sexual risk taking behavior such as unprotected sex. It seems that, overall, religious participation continues to be a protective factor in terms of adolescent sexual activity but that it may not protect adolescents from intercourse to the degree previously hypothesized (especially when adolescents follow personal strict guidelines around sexual behavior). It might be that religious activities tend to be adult mediated and occur during the times in which youth, not similarly occupied, may be initiating sexual activity.

Another reason religiosity and spirituality may delay sexual activity is not due inherently to a belief in God and adherence to a specific religious denomination, but due to a connection with a group of people involved in spirituality. Holder et al. (2000) found that "spiritual interconnectedness" (supportive components of an individual's ties to friends and associates within a body of faith) was the only spirituality variable negatively associated with a history of sexual activity. Additionally, the booming adolescent pledge movement (where adolescents publicly pledge to abstain from sex until marriage) also indicates ties to the importance of building a pledge identity within a moral community (Bearman & Bruckner, 2001). Adolescent pledgers are found to be significantly less likely to have intercourse than adolescents who do not pledge. However, this significance is heavily contingent upon the number of pledgers in the community (where too few or too many pledgers are not effective) and on the age of the pledger (the effectiveness of pledging tends to be less effective for older adolescents; Bearman & Bruckner, 2001). Overall, it appears that adolescents who have built connected relationships with other adolescents around religious/spiritual issues are more likely than other adolescents are to delay sexual intercourse. This delay in sexual intercourse appears to have more to do with these spiritually connected relationships with the people involved in the faith community than with their religiosity or spirituality.

Although it appears that pledging significantly delays sexual initiation, it may not completely protect adolescents from getting STIs. Based on data from the *National Longitudinal Study of Adolescent Health,* the rate of STI for pledgers was not significantly different than it was for nonpledgers (Bruckner & Bearman, 2005). The authors proposed that this may be due to the finding that pledgers are less likely than nonpledgers are to use condoms at their sexual debut and that they are less likely to be tested and therefore diagnosed with STIs (Bruckner & Bearman, 2005). From this study, it appears that the pledge movement has not been effective in decreasing STI acquisition in adolescents.

Debate Around Sexual Health Education

The extremely political debate over how to educate our students on sexual health issues centers the decision to teach our youth through abstinence-only curriculum or through comprehensive sexual health education. Abstinence-only programs focus on values, character building, and occasionally sex-refusal skills. These programs promote abstinence from sex, refrain from presenting information on contraception and abortion, and give information about STIs and HIV/AIDS as reasons to abstain from sex (Collins, Alagiri, & Summers, 2002). Comprehensive sex education programs or "abstinence-plus" curricula explore and discuss sex through the promotion of abstinence and the dissemination of information about contraception, STIs, HIV/AIDS, and abortion (Collins et al.). The type of sex education that a student receives in school is largely dependent on state statutes, parental wishes, public/private education, and federal funding.

Since 1981, the federal government has played a large role in the funding and promotion of abstinence-only education programs. Most recently, in 1996, Congress added a provision to welfare legislation indicating that any program that wishes to receive funding must teach that "sexual activity outside of marriage is likely to have harmful psychological and physical effects" (Starkman & Rajani, 2002, p. 316). To receive this money, states were required to match federal dollars with state dollars, a challenge that most states have met. Overall, from 1996 to 2002, funding for abstinence-only education has increased by 3,000% (Starkman & Rajani, 2002). The federal government has taken large measures (through funding allocation) to determine the type of sex education students receive in the United States. Although individual states (and many times local governments) have the right to determine the type of sex education provided to youth in schools, through the restriction of funding, the federal government is making a tremendous impact on how today's youth are being educated around sexual health issues.

What Does the Evidence Say?

In the end, there is no confirmatory evidence regarding which types of programs work better to delay adolescent sexual initiation, prevent teen pregnancy, and decrease STIs in adolescents (Kirby, 2001). In an attempt to compile and make conclusions upon the large amount of quality research on sexual health programs, Kirby and the

National Campaign to Prevent Teen Pregnancy compiled a report to develop some conclusions based on the programs that have been effective. In the end, Kirby came to a few basic conclusions. First, he found that there were few rigorous studies conducted on abstinence-only programs and only three programs ended up meeting the research criteria for inclusion within the report. Of the three programs included, none of them demonstrated an overall positive effect on the sexual behavior of participants (Kirby). Kirby commented that we cannot make a definitive conclusion regarding the effectiveness of abstinence-only programs at this time due to the diversity of abstinence-only programs and the scarcity of programs that have been subjected to rigorous research. Next, he concluded that programs that discuss sex and HIV education do not increase adolescent sexual activity. Although many parents, educators, politicians, and so forth believe that, by talking with children about contraception and sex, they will initiate sexual behaviors, the review of these rigorous studies has shown that is not the case. Finally, Kirby found that many of the sex and HIV education programs evaluated were effective in delaying adolescent sex, increasing condom or contraceptive use, and decreasing unprotected sex. These effective sex and HIV programs all shared the following necessary characteristics. These programs

1. focused on reducing one or more sexual behaviors that lead to unintended pregnancy or HIV/STD infection;
2. were based on theoretical approaches that have been demonstrated to influence other health-related behavior and identify specific important sexual antecedents to be targeted;
3. delivered and consistently reinforced a clear message about abstaining from sexual activity and/or using condoms or other forms of contraception (this appears to be one of the most important characteristics that distinguishes effective from ineffective programs);
4. provided basic, accurate information about the risks of teen sexual activity and about ways to avoid intercourse or use methods of protection against pregnancy and STDs;
5. included activities that addressed social pressures that influence sexual behavior;
6. provided examples of and practice with communication, negotiation, and refusal skills;
7. employed teaching methods designed to involve participants and have them personalize the information;
8. incorporated behavioral goals, teaching methods, and materials that were appropriate to the age, sexual experience, and culture of the students;
9. lasted a sufficient length of time (i.e., more than a few hours); and
10. selected teachers or peer leaders who believed in the program and then provided them with adequate training (Kirby, 2001).

Our current knowledge regarding effective programs to delay sexual behaviors, prevent teen pregnancy, and decrease unprotected sex among adolescents has shown that there are many components of effective programs and in particular those programs that stress both abstinence and contraception are the most effective.

What Does the American Public Want?

Although the United States government has painted a picture that the majority of American adults and teens want abstinence-only education provided to youth, this is not the case. In a national 2003 survey to adults and teens, the National Campaign to Prevent Teen Pregnancy (2003b) found that 75% of adults and 60% of teens wish that adolescents were getting more information about abstinence *and* contraception. Additionally, 67% of adults and 66% of teens surveyed reported that they would urge policy makers in Washington to place greater emphasis on abstinence *and* contraception in their legislation and funding allocation. Given this wish to have access to comprehensive sex education for teens, nearly all teens and adults surveyed (92% and 94%, respectively) believe that teens should be given a strong message from society that they should not have sex until they are at least out of high school. Additionally, most teens and adults (77% and 68%) feel that offering comprehensive sex education to teens does not offer a confusing or mixed message about teenage sexual activity (National Campaign to Prevent Teen Pregnancy, 2003b). Overall, it appears that the American public supports providing comprehensive sex education to adolescents that stresses abstinence.

Many national organizations have publicly announced their support of comprehensive sex education for all adolescents in an effort to encourage school districts to provide this for their students and in hopes that our national government will begin to change its funding policy of supporting exclusively abstinence-only sexual health programs. The American Medical Association, the American Academy of Pediatrics, the American College of Obstetricians and Gynecologists, the American Nurses Association, and the American Public Health Association, to name a few, have all endorsed comprehensive sex education for adolescents (Starkman & Rajani, 2002). Overall, it appears that both the American public and prominent medical associations

within the United States are in support of comprehensive sex education.

Sexual Health Education for Gay, Lesbian, and Bisexual Youth

In order to provide comprehensive sexual health education for all adolescents, it is very important that any education or interventions include information and conversation about same-sex partners among youth. Although many school districts and states do not allow for the discussion of homosexuality within the context of adolescent sexual health, students have questions and need correct answers to provide them with education to avoid risks and to promote healthy adolescent sexual identity development. School counselors and sexual health educators are likely to face barriers to the education and discussion of homosexuality in schools. However, in order to provide sexual health education for all students, this is a necessary component of all sexual health curricula.

In a 1995 study of school health teachers, Telljohann, Price, Poureslami, and Easton found that only 46% of teachers surveyed formally taught about homosexuality in their health classes. Additionally, only 1 in 4 teachers felt that they were very competent to teach about homosexuality in their health classes. Finally, teachers were asked to identify where they received their information regarding homosexuality, and the four leading sources of information were the mass media (66%), textbooks (50%), college classes (44%), and professional journals (44%). Overall, it appears that even when teachers are attempting to talk about issues related to homosexuality in health classes, many do not feel completely competent and may not be teaching correct information to their students.

When access to information about sexual health is not available or incomplete, many students choose to gain their sexual health education through other sources such as the Internet. Students who are engaged in the process of sexual identity formation may find some of these sites particularly appealing when they are not educated about gay, lesbian, and bisexual sexual health issues elsewhere. However, even when searching the Internet, it appears that many students are not given correct and adequate information regarding gay, lesbian, and bisexual sexual health. In a study of online sexuality education sites, Bay-Cheng (2001) found that only 9 of the 52 sites evaluated communicated an expanded definition of sex that extended beyond just vaginal–penile intercourse. Many sites failed to address the reality of same-sex sexual behaviors. Students who are engaging in same-sex relationships are rarely given spaces where they can ask questions about these sexual relationships and/or learn the risks inherent in same-sex sexual relationships.

Many teachers and school counselors desire to incorporate effective teaching about homosexuality in sexual health curriculum and overall school climate. The "Advocates for Youth" (2005) Web site provides multiple guidelines that educators can use to attempt to create inclusive programs in their schools. In particular, they suggested that educators (a) assess their own values and beliefs regarding sexual orientation and gender identity, (b) make it clear that homophobic sentiments and actions have no place in your class or school, (c) consider posting a "Safe Zone" sticker, (d) use inclusive language such as talking about "partners" or using ambiguous names such as Leslie or Chris when talking about relationships, (e) schedule training sessions (for both staff and students) to debunk myths and stereotypes, (f) provide peer support, (g) ask GLBTQ youth and adults to participate in panel discussions or as speakers, and (h) consider working with students to begin gay/straight alliances. By providing a safe space to ask questions about homosexuality, sexual health teachers and counselors can begin to address many of the incorrect assumptions children/adolescents have about gay/lesbian/bisexual youth and also to allow for supported sexual identity development of all youth.

How Can We Talk About Sexual Development Using a Positive Youth Development Approach?

At this point in their sexual development, adolescents are looking to adults in their lives to fulfill their curiosity about sex. However, for many, it appears that adults are unwilling to discuss or, more likely, uncomfortable in discussing sex with youth, which can lead teens to learning information about sex from their friends or to making assumptions on their own (which can come from erroneous details learned through the media, online searches, friends, uninformed adults, etc.).

One of the challenges for sex educators, school nurses, school counselors, youth mentors, and parents is learning to communicate the inherent risks of sex with youth while also emphasizing the positive aspects of sex. Although sexual education heavily emphasizes the biology of sexual development, the psychological impact of sexual development can be far more relevant for students who are looking for answers. This psychological piece of teen sexuality is a critical component of most sexual development curricula (more than the biological) because it draws youth in by addressing the values and morals inherent in sexual behavior. This component tends to attract teens because

it is here that they can begin to answer the burning questions, including the following: When will I be ready for sex? How will I know if I love someone? What if I am attracted to someone of the same sex? How can I say "no" to having sex? What will people think of me if I decide not to have sex? And, what will they think of me if I do? However, when particular sets of values and morals are integrated into sexual health curriculums, these questions tend to be stifled. It is much easier for educators to deliver messages of complete abstinence until marriage and fear-based messages around STIs and HIV/AIDS than it is to really talk to America's youth about the emotional and behavioral components of sex. Obviously, no sex educator can tell any teen when he or she is ready for sex. However, a positive youth development framework would ask educators and counselors not to frighten our youth about sex. Instead, teens want us to provide them with valid and comprehensive information, real-life discussions about feelings and desires during adolescence, lessons in negotiating relationships, and ultimately, a little faith that they are going to be able to make healthy choices about their sexual health as most teens do. Although sexual behavior carries with it many risks for youth, we are doing our youth a disservice by instilling guilt, secrecy, discomfort, fear, and alienation around sexuality.

What would a positive youth development approach to adolescent sexual health education look like? Just as the more academic subjects taught in schools, sexual health programs need to promote critical thinking skills in their students. In addition to factual information about the physical aspects of sexual development, adolescent pregnancy, birth control, and STIs, a comprehensive sexual health program would include discussions around sex and the media; America's discomfort in talking about sex; positive aspects of sexuality; how to negotiate teen relationships; feelings around sex including pleasure, desire, guilt, anxiety, and so forth; and ways to assert oneself in sexual encounters (when and how to say "no" or "yes" to sex; how to ensure that a partner uses protection; how to get oneself out of an uncomfortable sexual situation, e.g., you can say "no" at anytime). Adolescents want honest and real-world answers about how to manage their sexual development. If this information is not provided in discussions with knowledgeable adults they will find it elsewhere (which may not be adequate or healthy information). Although challenging, adults need to trust that if they provide our youth with comprehensive, factual, relevant, and real-life information, they will be able to make positive and responsible choices in their own lives.

Another means by which schools can integrate information about sexual health in the school community is by forming school-based health centers (SBHCs). SBHCs are clinics located in schools that provide students with basic health care including annual physicals, immunizations, asthma care, STI treatment, smoking cessation behavioral interventions, and preventive counseling for various health issues (for further information on SBHCs, see "Physical Health and Emotional Development," Knudtson & Coleman, chapter 16, this volume). It is important to note that SBHCs do not just offer services pertaining to adolescent sexual health (and some SBHCs do not even offer sexual health services for their students). SBHCs are mentioned because school-based clinics are an important means by which schools can create safe spaces for students to gain knowledge and receive services pertaining to adolescent sexual health. Providing students with sexual health resources at school can alert students that their school is concerned with helping them negotiate romantic relationships and is investing in their students' abstention from sex as well as helping students to prevent unplanned pregnancies and STIs.

How Can School Counselors and Educators Be Involved in the Sexual Health Education of Their Students?

The educational attainment of students is greatly affected by teenage pregnancy. Only 41% of teens who begin families prior to age 18 complete high school (National Campaign to Prevent Teen Pregnancy, 2001). Additionally, only 1.5% of teenage mothers earn a college degree by the time they are 30 years old (Maynard, 1996). The children of teen parents are also likely to struggle in school. It is reported that the children of teen parents are 50% more likely to repeat a grade in school (National Campaign to Prevent Teen Pregnancy, 2001). Educational failure and teen pregnancy seem to have a reciprocal relationship. Manlove (1998) found that 28.2% of teen parents had dropped out of school prior to becoming pregnant and 30.3% dropped out after they had become pregnant. Additionally, educational failure has been found to be a key predictor of adolescent pregnancy (Robbins, Kaplan, & Martin, 1985). Overall, teen pregnancy is a barrier to educational attainment of high school students, and it is more likely that adolescents will become pregnant if they are not in school or are performing poorly while in school.

School counselors and educators can help to curb the likelihood that adolescents will engage in sexual activity or become pregnant by creating a safe school environment where students feel connected to their school (for information concerning creating a caring school community, see Lindwall & Coleman, chapter 24, this volume). Blum (2005) found that students who feel a strong connection to their school and have a higher GPA were more likely

to postpone sexual activity. Additionally, female athletes have been found to postpone sex until later in life, to have sex less often, to have fewer partners, to be less likely to get pregnant, and to be more likely to use contraception (National Campaign to Prevent Teen Pregnancy, 2003a). Adolescents have identified counselors and teachers as the second most reliable source of sexual health information they receive (parents were first; Ehrlich & Vega-Matos, 1998). Overall, adolescents are better able to negotiate their sexual health development successfully when they feel connected to their schools and are able to communicate openly and honestly with their counselors and teachers about their sexual health.

School counselors can be important team members in the construction and delivery of sexual health education curriculum. In particular, the major factors that facilitate and constrain sexual activity are the core components of a developmental guidance curriculum. For example, in the state of Wisconsin, students are to acquire 10 skills as an outcome of a development guidance program. These skills include the abilities to (a) understand the connections among family, school, and work; (b) solve problems; (c) make decisions; (d) set and achieve goals; (e) harness emotions productively; and (f) be empathic. As has been consistently presented in this chapter, these are the skills adolescents need to effectively negotiate the risks and opportunities of sexual development. With these skills, an adolescent is better prepared to use the content provided in sex education. We advocate for the integration of sex education with social skill development as a potentially more effective educational model. However, there are no examples of such integration in the literature. Ultimately, school counselors can contribute significant information and skills to their schools' discussions on how to educate their students around issues pertaining to sexuality and sexual health.

School counselors can be instrumental in facilitating individual student growth around sexual health issues. The following includes two case study examples of how a school counselor may address sexual health issues with a student.

Mariah

Mariah is an 11-year-old, Latina sixth grader at an urban middle school. In the past 10 years, her community has experienced an increase in violence, including two public sexual assaults that occurred in her neighborhood. Mariah became sexually active at age 10 and has been involved the previous year with four male partners. After discovering that Mariah was sexually active, her mother contacted the school counselor, Delia, to attempt to support Mariah in stopping her risky sexual behavior. After speaking with Mariah, Delia discovered that Mariah had made the decision that she no longer wanted to have sex (at this stage of her life), but that she was struggling in creating a new identity for herself as a girl who is not "easy." Mariah was struggling in school because she was experiencing teasing from her peers around her past sexual involvement. Additionally, she struggled with developing healthy relationships with her male peers that were not grounded in having sex. Delia determined that Mariah would benefit from the development of positive social skills as well as psycho-education around healthy relationships. Mariah joined a healthy relationships girls' group at the school to allow her to connect with other female students and learn skills in developing healthy friendships and romantic relationships. Additionally, she worked individually with Delia to address how Mariah could learn to connect with others in romantic relationships without the need to use sexual activity as a means to build connections.

Abdulle

Abdulle is a 16-year-old, Somali 10th-grade student at a suburban high school. He has been coming to see the school counselor, James, for one year due to academic struggles and depression. During his most recent meeting, Abdulle discloses to James that he has been involved sexually with other males in the community. Abdulle adamantly states that he does not consider himself gay and that he has not told his friends or family about his relationships with other men. James asks Abdulle if he has been using condoms when he has sex with other men. Abdulle states that he does not need to use condoms because he is not gay and he storms out of the office.

The next week, Abdulle returns to see James for their regular weekly meeting. James tells Abdulle that he did not make the assumption that Abdulle was gay and that he was sorry that he had given Abdulle that impression. Abdulle states that it is not okay for people to be gay in his community and that he does not want to be associated with this label or for others to know that he has been having sex with men. James stresses confidentiality with Abdulle and states that he will not share Abdulle's disclosure with anyone in Abdulle's community unless it appears that he is harming himself or someone else. James also tells Abdulle that he encourages all students to use condoms when having sex regardless of sexual orientation and regardless of whether they are having sex with same-sex or opposite-sex partners. James indicates that he is concerned about the potential of Abdulle acquiring an STI like HIV if he continues to have unprotected sex. Additionally, he encourages him to be tested for STIs at the confidential teen clinic in

town. Abdulle continues to state that he does not believe that he needs to protect himself because he is not gay.

Over the next 6 months, James continues to work with Abdulle on understanding his evolving sexual identity as well as coming to terms with the need to protect himself from STIs even when he does not identify as gay. James continues to encourage Abdulle to engage in healthy relationship-building activities (e.g., discussing past sexual history with sexual partners, encouraging sexual partners to wear a condom, and practicing open communication with sexual partners). Additionally, he works with Abdulle at understanding his community's prejudice around gay people and how this impacts how Abdulle feels about himself and his current sexual experimentation with men.

Conclusions

In our roles as educators, parents, siblings, grandparents, caretakers, and adults, we are consistently reminded of the saying "children grow up too fast." As we watch children grow up, we are amazed at how fast they learn to crawl and walk on their own, begin their first days of kindergarten, read their first books aloud, attend their first sleepovers away from home, dance at their first boy/girl parties at school, and kiss their first boyfriends/girlfriends. These huge milestones tend to come very quickly for most adults, and it can be hard to comprehend that once young children will soon be adults. Therefore, many adults struggle with realizing that children need information regarding romantic relationships and sexual health at a younger age than many adults feel is appropriate. It is important for us to remember that as children age, they *will* find answers to their curious questions about relationships and sexual health. Therefore, to prevent them from learning at times inappropriate and incorrect information about relationships and sex through the media, the Internet, and their peers, we must provide them with timely and accurate information about their developing sexuality. SBHCs are an excellent addition to any sexual health education program that can provide students not only with information about their sexuality but also with the sexual health services that are needed as adolescents begin to learn about themselves as a sexual beings. Schools are perfectly situated not only to provide students with academic knowledge and skills, but also to assist them in learning how to successfully manage romantic relationships with others as well as begin to understand their developing sexuality.

XVIII
SCHOOL COUNSELORS' ROLE IN PROMOTING LITERACY IN ELEMENTARY SCHOOL–AGED CHILDREN

CARRIE J. LINSKENS
Office of the Attorney General, Nevada Department of Justice

HARDIN L. K. COLEMAN
University of Wisconsin–Madision

Introduction

According to Bloome (2001), literacy is not an abstract and independent concept, but one that depends on the context for its meaning. How individuals, especially students, identify, use, and interpret reading and writing and how written texts are constructed depends on and differs across communities. Every personal encounter and situation entails a construction of a new style of communication. Thus, even though a community often creates the definition and patterns of literacy, it is significant to note that our understanding of literacy is a continuously evolving process that is often specific to a community. In this chapter, we want to accomplish two goals. The first is to help school counselors understand and have the language to describe how important literacy is to academic accomplishment. The second is to share a model, derived from interviews with school counselors, of how literacy skills can be developed through participation is a school counseling program.

Why Literacy Is Important in Childhood

According to Serpell (2002), three themes capture the importance of literacy and children being literate: (a) entertainment, (b) skills, and (c) everyday life. First, literacy can be a form of entertainment to children because they can read books they enjoy, write stories, and assist in finding new interests that can steer them out of troublesome activities. Second, literacy is also important because it can assist children in acquiring certain skills. For example, literacy activities can encourage children to recite the alphabet, to recognize letters, and to learn letter sound correspondences and can even aid children in practicing reading words from cards or lists. These literacy skills can be important early in a child's life and can promote future reading achievement or language development in later school years (L. Baker, Scher, & Mackler, 1997). The third and final theme emphasizing the importance of literacy identified by Serpell is everyday life. In this form of literacy, children who read find it is useful and beneficial in everyday activities, such as going to the grocery store or reading traffic signs. It is also important for children to become literate in order to function in society, for instance by reading the bus schedule, paying bills, or looking up phone numbers.

Other authors have written about additional ways in which literacy during childhood leads to positive outcomes. For example, literacy development is linked to early interest in reading and achievement (L. Baker et al., 1997). Furthermore, interactions about literacy may foster social connections, promote interests in reading and writing, and motivate activity by engaging the children in reading and writing with adults or other peers in order to achieve goals (Morrow, 1997). Finally, literacy fosters family interactions and communication (L. Baker et al.). In sum, literacy development is viewed as a crucial component in a child's life. Becoming literate appears to be important in order for children to succeed in school and to become successful citizens in society.

Current Perspectives on Literacy Definitions and Acquisition

To understand the topic of literacy, it is necessary to analyze current definitions of literacy and different perspectives regarding the process of becoming literate. A study by Evans, Shaw, and Bell (2000) describes young children's early literacy and oral language skills as letter name knowledge, letter sound knowledge, phonological sensitivity, and receptive vocabulary. This study examined what types of activities are done with children (e.g., being read to regularly), which do or do not enhance literacy skill development. Their findings support the role of parental involvement in enhancing children's reading achievement—both before and during early formal reading instruction at school. In contrast, Duffy (2003) defined literacy mostly in terms of reading behavior and contended that one should not only teach reading but should also explain and model the process of reading. He discussed four critical aspects of reading: (a) concepts about reading, (b) vocabulary, (c) skills that readers learn automatically, and (d) strategies that readers employ thoughtfully and adaptively. Duffy illustrated that the most effective way to explain the concepts of reading to children is via scaffolding. Scaffolding uses cues that focus students on key elements and then gradually reduces the amount of assistance when the students show evidence of achieving the objectives. As students make sense of the material, they observe each student's responses closely in order to determine how the student is making sense of the cues provided. All of this is done in order to be able to change or modify a cue in response to the child's level of understanding.

According to Pressley (2002), there has been too much controversy about literacy instruction between the skills instruction approach and the whole language approach. Pressley believed that literacy is better taught by maintaining a balance of skills instruction and holistic reading and writing experiences by both methods. Pressley claimed that literacy development strongly depends on the type of instruction and that it is important to have a balance in order to meet all different reading and learning styles in the classroom.

In addition to focusing on how literacy is acquired in particular domains (e.g., at school or at home), Morrow (1997) suggested that literacy can be acquired by different processes and methods. Morrow asserted that the following four processes assist learners in acquiring literacy abilities and skills: (a) observation, (b) collaboration, (c) practice, and (d) performance. First, children may often observe different literacy behaviors in others. For example, children may watch other children being read to or may see other children reading and writing. This may introduce the child to the idea of reading and writing and may begin to formulate ideas in the child's head regarding literacy activities. One hopes that the child will see a positive interaction between an adult and a child reading a book, for instance, and become more interested in pursuing a book him- or herself. Second, children may experience collaboration with classmates and peers regarding literacy activities. For instance, a child may have a social interaction with a learner or with other children who may provide encouragement, help, or motivation about reading and writing skills. Third, after a child observes and possibly receives some positive feedback and collaboration from other children about literacy activities, the child may practice literacy activities on his or her own. For example, a child may actually try out what was learned by reading and writing with the other children or by him- or herself. Fourth, a child may actually perform the literacy activity and share what he or she accomplished. The child may then seek approval or guidance from others about what he or she read or wrote. Overall, there are many different processes involved in literacy besides the actual performance portion of reading and writing.

Overall, there is a wide range of literacy-based activities that promote literacy in children (Serpell, 2002). Joint storybook reading with parents or with peers and teachers, language games, visits to the library, observation of pictures and written texts, and even dinnertime conversations can all be forms of literacy in children. Even activities such as reading picture books, magazines, newspapers, comic books, word puzzle activity books, or any other kind of book can promote reading skills in young children. Not only do reading activities promote literacy in children, but writing activities do as well. For instance, drawing; coloring; writing letters, stories, and poems; playing games involving words and writing; and even writing in journals and diaries promote writing skills in children, which may also enhance literacy development.

While many view literacy as a set of cognitive–linguistic skills that are acquired by an individual, literacy can also be viewed as a set of social and cultural practices that are enacted by a group (Bloome, 2000). This point of view examines the interactions among individuals in social and cultural activities that usually involve written language. It also examines how certain literacy abilities may affect the individual's social and cultural identities as well. This view of literacy examines the variations in literacy practices that may reflect individual's cultural differences, socioeconomic differences, gender relationship differences, or even different orientations in political activities.

Literacy has also been conceptualized by Gee (1989) in terms of the use of discourses. He described discourses as a way of being in the world and as a form of life that integrates words, values, beliefs, acts, attitudes, and social

identities, not excluding body positions, clothes, gestures, and glances. However, he defined literacy as "the mastery of or fluent control over a secondary discourse" (p. 8). Primary discourses usually involving home life, and peers are the way we make sense of the world and others. On the other hand, secondary discourses include interactions with various non-home-based social institutions in the public sphere that is beyond the family and peer group (e.g., schools, local stores, churches, community groups, and local, state, and national businesses, agencies, and organizations). Secondary discourses entail being able to "use" the discourses and function in the discourse. For instance, literacy involving school discourse may mean reading and writing. However, to be literate in this discourse is to be able to function in school and to be able to read and write in order to complete tasks.

Gee (1989) argued that literacy is not taught; rather, it is acquired. For example, teachers do not teach literacy in school. Rather, teachers provide the opportunity for children to acquire literacy through experiences at school. In addition, the school gives children opportunities to practice what they are acquiring. Gee also stated that learning cannot take place unless literacy skills are acquired both in school and through experiences at home. Thus, school does not directly enable children to become literate; it does equip children with metalevel cognitive and linguistic skills that they can use to critique discourses in their lives. This may pose a problem to children who are not receiving school congruent literacies at home or the opportunity to acquire these literacy abilities in a school setting. Disadvantaged children may have few opportunities for the acquisition of these secondary discourses within the home setting; thus, they cannot use the learning and teaching to develop the metalevel cognitive skills within the school setting. Another problem that may occur is that nonmainstream children's discourses may be very different from the mainstream discourses provided and taught, which may cause a conflict with the child's family values and beliefs. Although Gee's construction of the literacy process may reinforce a deficit model for those whose secondary discourse is different from the discourse of schools, it is important to acknowledge that this difference creates learning challenges for the child who has to learn these different discourses in order to be effective in either context.

There are many secondary discourses; thus, there are many forms of literacy (Gee, 1989). We have all acquired some forms of literacy and have failed to have others. Today's modern society and its secondary discourses usually involve print. However, literacy can take on many forms, including interactions and conversations, for example. Thus, it is important to understand that when one is using a mainstream definition or understanding of literacy and what constitutes literacy, it may be different from what constitutes a child's culture, family, discourses, and access to literacy activities.

A recent article by Daggett (2003) examines three separate definitions of literacy that were taken from the National Adult Literacy Survey (NALS) and the International Adult Literacy Survey (IALS). Daggett highlighted three definitions of literacy, and he reported that school counselors must play an integral role in redefining education to coincide with essential 21st century employability skills and technology competencies. Daggett also noted the importance of the need to redefine literacy and the ambiguity that comes along with it. The three definitions are as follows: First, prose literacy is described as the knowledge and skills needed to identify, understand, and use information from continuous text sources (e.g., newspaper editorials, magazine articles, reference sources, and fiction). Second, document literacy is defined as the knowledge and skills required to locate and use information contained in functional materials (e.g., job applications, payroll forms, transportation schedules, online consumer surveys, maps, graphs). Third, quantitative literacy is defined as the knowledge and skills required to apply arithmetic operations, either singly or sequentially, using numerals and quantitative data embedded in printed materials (e.g., balancing a checkbook, figuring out a tip, completing an order form). These three definitions are often helpful to contextualize literacy and how it may be defined differently in many domains and to different researchers.

In this chapter, we will focus primarily on Gee's (1989) concept of secondary discourses. From this perspective, literacy is the ability to manipulate symbols and to communicate and express one's understanding of self and of the world and to understand how others express these experiences. This includes the understanding that the dominant form of literacy is through print, but that other forms of communication (e.g., music, film, or drawing), are legitimate methods for expressing and understanding ways of sharing views of the self and the world. Being literate, therefore, means being competent to express and understand the process of communication. We believe that effective communication is one outcome of a school counseling program. For this reason, we think an understanding of literacy and how school counselors are involved in its development is an important professional competency.

The School Counselor and Literacy

What is the school counselor's role in the process of developing literacy in school-aged children? The American School Counselor Association's (ASCA; 2003) *National Model* summarizes what is evolving as a set of expectations for the school counselor's role. The ASCA model of

school counseling has four main systems (i.e., accountability, delivery, foundation, and management). The ASCA model also incorporates four themes to guide the school counselor's role: leadership, advocacy, collaboration, and systemic change as part of the framework. The four themes represent the importance of the school counselors' work within these areas. School counselors play an important role in improving student achievement and are unique in that they are advocates for students and systems.

Hardesty and Dillard (1994) examined the role of the elementary school counselor in comparison with middle and secondary school counselors and found three major differences in the ranking of school counselor activities by elementary school counselors. First, elementary school counselors were found to perform more coordination activities and consultative activities (e.g., consulting with faculty and parents, and coordinating programs). Elementary school counselors were also found to perform fewer administrative activities, such as paperwork and scheduling, than middle school counselors were. Finally, even though both elementary and middle school counselors were found to work with student concerns on an individual basis, elementary school counselors tended to work systemically (e.g., with families, community agencies, and teachers). In addition, the least likely activity performed by elementary school counselors involved vocational and post-high-school educational activities. However, the larger emphasis on coordination activities is consistent with ASCA's suggestion that classroom guidance and curriculum is an important component of elementary school counseling.

One of the shortcomings in the current understanding of the school counselor's role is that none of the existing models address how the school counselor's responsibilities apply to core areas of academic competence such as literacy. Specifically, research is vague or nonexistent on the school counselor's role in literacy. This leads to questions about whether school counselors even have a role in promoting literacy in school-aged children and, if so, why. These common questions are not answered in the current literature.

According to Delpit (1995), "[S]tudents must be taught the codes needed to participate fully in the mainstream American life, not by being forced to attend to hollow, inane, de-conceptualized sub-skills, but rather within the context of meaningful communicative endeavors" (p. 45). Delpit highlighted the multiple flaws that take place in our educational system, especially when it comes to children of color and even more so when it comes to the development of literacy. She emphasized the difficulty that children of color have in academia because they are being taught in a White American frame of reference, by White teachers, and like White children. She pointed out that children of color do not learn well this way and, therefore, they often lag behind their White peers and fall behind in school. Referring back to Gee's (1989) perspective, the cultural difference in primary discourses increases the difficulty of effectively acquiring secondary discourses such as literacy. Delpit's quote illustrates the importance for all cultures to be brought into the classroom and for having literacy interactions and different methods of literacy to which students of color can relate and from which they can learn. Teachers are not capable of achieving this ideal goal alone; hence, other school personnel have an important role regarding literacy development. Delpit suggested that school counselors are in a unique position to use developmental guidance and counseling as an aid for teachers and other school staff in the promotion of literacy and "meaningful communicative endeavors." From this perspective, literacy is not only a teacher's job but also an important focus of schoolwide activity. School counselors can collaborate with parents, students, teachers, and other school personnel and can join and take part in the literacy movement that needs to occur in order to make classroom instruction more effective across various cultural groups.

The perspective that school counselors should be involved in literacy development in school-aged children was also shared by Daggett (2003). He suggested that school counselors who take leadership roles in schools need to question current definitions about literacy and learning and expectations about student achievement and success. School counselors need to track changes happening in the world that require new ways of thinking in order to assist students in gaining those resources to adapt to the changes. School counselors are also equipped to integrate relevant activities into classrooms, especially using technological information. If school counselors can become educated in the manner in which computer and Web industries are redefining literacy, they will be able to assist students in becoming computer literate in order to keep up with the current job market and computer industry. Daggett asserted that school counselors can be student literacy advocates by alerting parents, decision makers, and students that the reading tasks required by adult roles now involve higher readability levels than ever before. The current gaps between graduates and employer needs are continually increasing; school counselors can help bridge the gap. Daggett emphasized, "With the influence school counselors hold in student curriculum decisions, their leadership in promoting greater attention to literacy cannot be understated" (p. 240). Daggett suggested that school counselors need to expand their influence, assume a role in mentoring teachers about the changing workplace, convince administrators to provide only rigorous and relevant learning options, and alert parents and students of the increasing literacy expectations in society. He also argued that if school counselors do not assume some leadership

roles in academics and greater levels of achievement, their roles in modern schools will soon become irrelevant. It is important that school counselors become involved in any type of movement that will prepare students with the literacy skills they will need to succeed.

Another perspective suggests that some students struggling in literacy may not need expert instruction at all times (Allington, 2001). Some instruction sessions could be taught by other school personnel (e.g., the school counselor) who would allow the teacher more time to assist students who are having difficulty. It would also give the school counselors a chance to get involved in literacy development. Allington believed school counselors should support teachers in their efforts to become more expert and reorganize all of the aspects of the educational system so that they can teach as expertly as they know how. School counselors can be supportive in literacy development in many ways. For example, they can support the children and help with one-on-one assistance or instruction of literacy, and they can also support the teachers in learning more about literacy instruction and what works best for the students.

D'Andrea (1995) gave a final example of the school counselor's role in literacy development in school-aged children. He emphasized the importance of multicultural literacy, which is defined as a state of being knowledgeable and respectful of the history, traditions, and values of persons from diverse backgrounds. With the increase in cultural diversity in the United States, the need to increase multicultural literacy among students is crucial. D'Andrea proposed that elementary school counselors, teachers, and administrators will soon be pressed to implement educational strategies that help children develop skills necessary to manage the technological demands and the interpersonal challenges related to living in a highly diverse society. He suggested that elementary school counselors, who continue to increase their own level of knowledge and skills in the areas of multiculturalism, in turn, can consult with teachers and administrators about ways to bring multicultural and computer literacy into the curriculum.

Although the research on the role of school counselors in the development of literacy in school-aged children is still in its infancy and most of it is theoretical, it is clear that scholars in this area are advocating for a more explicit focus on literacy as a pathway to student achievement and an appropriate focus for school counselors. The existing literature suggests several ways in which school counselors can integrate a focus on literacy within their current role. The first is as a change agent within a school. In this role, the school counselor would focus on ways in which teachers can be provided more resources to address literacy development (e.g., culturally relevant curriculum or support within the classroom to focus on students with higher needs). The second is as a coordinator of services. In this role, the school counselor would work with parents, teachers, students, and others to increase the focus on the literacy needs of particular children or the whole school. The final approach is that of a direct stimulant to literacy. Hence, the school counselor would be explicit about the developmental guidance program used to promote literacy. Each of these approaches has conceptual merit, yet each is not based on empirical support.

In the research on literacy development, many limitations and strengths are important to note. Some of the weaknesses in the existing research are that many of the articles and books continually focus on what is wrong within school systems, with certain models, or in what is currently being done in literacy that is not working well. Rarely do studies actually test methods to determine the changes needed to improve the literacy of children. Generalizability is difficult because situations and problems related to literacy development are often context specific. Another common limitation of the literature is the lack of recognition of the many duties that the school counselors already have. School counselors are having trouble finding time to do direct services as it is, much less finding time to work on literacy activities. Finally, the articles do not talk about training for literacy educators. It is difficult for school counselors to become more involved in literacy development, for example, when their training programs have not adequately prepared them.

There are also many strengths of the literature examined. Almost all give a definition of literacy. This literature comprises books, national guidelines, instructional guides, articles, and qualitative and quantitative studies, providing many different views on the topic. Some of the books presented provide examples of programs and interventions for literacy improvement, which serve as a groundwork for future programs. A final strength of the literature is that it examines cultural factors by recognizing that mainstream culture sometimes tries to teach literacy only in one "mainstream" form. However, programs and research are being implemented to consider children of color and the influence of sociocultural factors on their literacy development.

Even though there are strengths and limitations in the domain of literacy development, there are still some gaps in the literature that need to be filled. More needs to be known about literacy development, especially in relation to school counselors' roles. Rowell and Hong (2002) suggested that new standards for education would enhance counselor involvement in students' academic development; would help strengthen the bond among school counselors, teachers, administrators, students, and parents; and would help demonstrate the importance of school counselor involvement in the educational system. They suggested

school counselor training should involve more academic support of students.

More research needs to examine what school counselors actually do, what their stated job responsibilities are, and what roles can be altered to best improve the student and the educational system as a whole. Therefore, given Bloome's (2001) earlier definition of literacy and how it depends on a child's culture and interactions, it seems important to understand how practicing school counselors perceive their role in literacy. In this chapter, we share a phenomenological understanding of how professional school counselors perceive their involvement in the development of literacy in school-aged children.

A Beginning Phenomenological Understanding of the School Counselor's Role in Promoting Literacy

Given the lack of research examining the role of the school counselor in promoting literacy in school-aged children, there is a need for creating a baseline understanding of the school counselor's role in the development of literacy. To achieve this understanding, we asked eight practicing school counselors to share with us the activities they use to promote literacy in their developmental guidance and counseling programs. To focus the interviews we defined literacy as the ability for children to understand and manipulate a written word. What we found reinforces the hypothesis that school counselors can be actively engaged in helping all students develop and practice literacy skills. Using a thematic analysis, we found four core themes (represented in Table 18.1) around which a school counselor may organize his or her involvement in the process of literacy development.

Table 18.1 Four Core Themes

1. The school counselor has multiple roles.
2. Contextual considerations are crucial.
3. School counselors are promoters of literacy, not instructors.
4. Ambivalence leads to enlightenment.

Theme 1: The School Counselor Has Multiple Roles

Across all of the interviews, it was evident that school counselors in every school and in every district have multiple roles and duties. The primary duties that were consistent for all of the participants were to (a) produce desired outcomes in students, (b) adopt a team approach with other school staff, (c) facilitate socioemotional development as primary, and (d) promote literacy as a secondary outcome to their work. For instance,

> My role is to support the child in academics, not to teach the child in academics. My role is to make sure that the child is healthy enough so that he or she can be learning in the way that he or she needs to. I see it certainly as part of what I'm helping the child do by means of helping with the things that are impeding his or her academics, so that I can remove those impediments then indirectly I'm helping with literacy.

Theme 2: Contextual Considerations Are Crucial

Many of the interviewees found contextual factors to be crucial considerations in their jobs, suggesting that certain structural school considerations, such as contextual factors (e.g., family) or the difference in school counselor training program, may hinder what work is done with the children. The school counselors stated that the work that they do with students largely depends on the contextual considerations. For instance, if a school has very involved parents, the school counselor may not need to be as involved in the promotion of literacy in the students. Another example could be, "I have 800 to 900 children that I am responsible for as a school counselor," or on a positive note in relation to literacy, "In our district, anyway, there are really a lot of people dedicated to specific literacy issues that are helpful to the teachers." Thus, contextual considerations, whether positive or negative, were consistent across all eight interviewees and in their duties as school counselors.

Theme 3: School Counselors Are Promoters, Not Instructors, of Literacy

The third core theme was that the school counselors were promoters or enhancers of literacy development in children, but not instructors. These school counselors felt that they were not trained to instruct literacy-related lessons and that it was more of a teacher's job for the phonetics and instruction of literacy. However, they stated that they do play a strong role in enhancing literacy activities in children, even if they did not realize it before sharing their stories in these interviews. The school counselors in the study promoted literacy through the techniques and interventions that they employed in developmental guidance and counseling situations (e.g., focus on communication of ideas or reading about situations of relevance to the

students) by facilitating socioemotional development and developmental guidance instruction. One school counselor stated,

> Sometimes we'll play a game where they have to read the cards or read the problem-solving cards. That is not my specific goal; I think it happens as a side sometimes. I don't set up the literacy components, I get them ready to be able to be receptive to them.

This is an example of the manner in which school counseling programs support literacy development. Many of the school counselors described the multiple literacy-related techniques that they do with children, however, they did not think of them as explicitly related to literacy promotion because often times it was not their intention. With reflection, they were able to see how much of their work did provide the underpinning for literacy.

Theme 4: Ambivalence Leads to Enlightenment

The final core theme was that the interviewees began the interviews by saying that they did not promote literacy and that teachers primarily fulfilled that role. However, during the hour interview, almost all participants had an increased awareness of "enlightenment," meaning that after they told of the activities that they did with children, they realized that many of them were involved in literacy promotion. For example, one interviewee stated at the end of the interview,

> If you would have asked me that first I think my answer might have been different. Now we've been talking as long as we have and I've made some realizations on what I've been doing, I feel I'm doing a pretty good job in promoting literacy in the time frame that I have. I'm incorporating it into my developmental guidance lessons, I'm trying to use it on a whole school basis with the assemblies. I feel overall that I'm doing a good job with it and just having a positive attitude with literacy in general and promoting reading. I'm actually realizing now that I do quite a bit with it. At first I would have been like I don't know. . . . I could do more. I think that every one of my guidance lessons has something to do with literacy.

Another example was a comment that, "I'm seeing that it is important and there are things that I do and there are more things that I could do to promote literacy in the classroom." Once again, the theme emerged that once discussing the topic of the promotion of literacy, school counselors realized that they actually did more than they thought. Furthermore, they also considered the notion that they could possibly do more in this area of academic development. Along with the enlightenment phase of this theme, there was also some ambivalence about saying that they do promote literacy. For example, the same counselor who was just quoted said,

> I'm not instructing literacy, am I promoting it? I mean I guess I am! Do I see that as part of my job though? I see that as something that I do, but I don't know if as a counselor I see this as part of my job expectation.

Overall, this last core theme represents the increased awareness of what school counselors actually do, including the promotion of literacy development as a large part of their job description once they look at it from that perspective. In this manner, school counselors are providing opportunities for students to develop their skills in the secondary discourse of literacy that Gee (1989) suggested is fundamental to the learning process.

Implications from the Phenomenological Exploration of Elementary School Counselors and Promotion of Literacy

The purpose of this chapter is to heighten the fields' understanding of the importance of literacy in the academic progress of students and to show that school counselors are actively involved in the process of literacy development. Using Gee's (1989) conception of secondary discourses (which suggests that literacy is the ability to manipulate symbols and communication to express one's understanding of self and of the world and to understand how these experiences can be expressed by others), we wanted to show how school counselors perceive their role in this process. What we have found is that the dominant relationship school counselors have with literacy development is one of ambivalence. School counselors assert that they are not reading specialists, that they are not teachers, and therefore, that they do not organize their daily activities around literacy development. Upon reflection, however, school counselors came to understand that their work is focused on helping children develop a deep and emotional understanding of the secondary discourses, which creates their sense of the world. In turn, this understanding is a fundamental stepping-stone in becoming literate. We found that this insight could move school counselors from

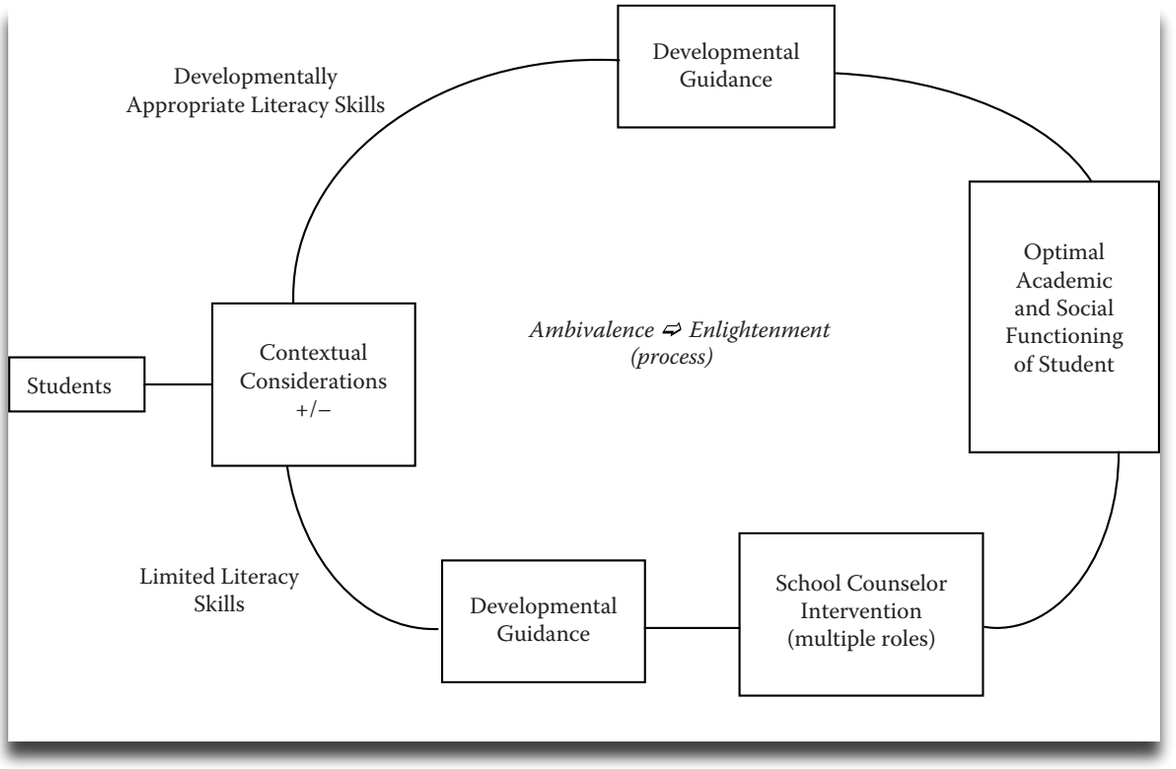

Figure 18.1
School counselor's role in Literacy Development.

ambivalence concerning their role in literacy development to one of enlightenment as to how much of their work created the context in which students developed literacy.

As represented in Figure 18.1, there are four core themes that represent this perspective on the school counselors' role in literacy development. The first is that they are charged with understanding and working with the contextual factors that affect a student's preparation to become literate. Contextual factors include family conditions, teacher competence, quality of instruction, and other factors around the child, which influence or facilitate his or her preparation for becoming literate. If these contextual factors facilitate literacy, then the school counselor can focus on a developmental guidance program, which supports, enhances, and practices the literacy skills and perspectives a child gains from his or her parents, peers, and teachers. If they do not, then the school counselor uses developmental guidance to stimulate the student's interest in acquiring an understanding of secondary discourses through reading about emotional and behavioral issues as a way to motivate the student to develop school-oriented literacy. If developmental guidance activities are insufficient to the task, the school counselor uses a variety of roles (individual or group counseling, consultation, or teaching) to stimulate the child to acquire literacy.

The middle of the model has a bubble that represents the movement from ambivalence to enlightenment. This area is the process that occurred throughout these interviews. This model was formulated after the school counselors realized how much literacy promotion they actually did with their students and how different it was with each student at each school. This core theme happened with many of the different school counselors at many different times throughout the interviews. Some participants experienced ambivalence to enlightenment while in the midst of the interview, and some realized it at the end. We are not suggesting that this model is applicable to each child, let alone each school counseling program. We are suggesting that there may be a pattern to the paths that students take to develop their literacy skills through a school counseling program.

Erford (2003) supported our notion that school counselors can support the facilitation of literacy acquisition. He described 10 roles of a school counselor, over half of which can impact literacy development. First, Erford suggested that developmental guidance could be a means of achieving academic achievement in children. We found that most of the literacy-based activities these school counselors do with children are done during either individual counseling or developmental guidance periods. Second, Erford stated that school counselors should be collaboration specialists between community and school members. We also found that school counselors act as collaborators by teaching parents how to enhance literacy skills in the home set-

ting. Third, Erford stated that a school counselor's role is as a career and educational planning specialist. The school counselors we interviewed also said they perform literacy enhancing tasks with children involving career and computer activities and in academic areas in which the child may be struggling within the classroom. Fourth, the school counselor performs individual and group counseling as a role, which can be utilized as a way to incorporate literacy activities in counseling interventions. For instance, a group on self-esteem issues might give the children an opportunity to read a book on positive self-affirmations or allow them to engage in a writing activity in which they write down positive things about themselves in a journal. Fifth, Erford suggested that a school counselor's role is an advocate for social justice. This role involves school counselors working toward removing the barriers that students may experience in an effort to educate students and promote social and emotional development. This is reflected in the experiences that were shared by the participants in the study via the literacy-based activities that they had implemented. Finally, Erford suggested that school counselors are agents of diversity and multicultural sensitivity. The school counselors that we interviewed fulfilled this role by creating diversity groups or making signs of diversity and putting them around the school. D'Andrea (1995) also suggested that it is important for school counselors to help with the promotion of multicultural literacy. In the study that we presented, we found that many of the school counselors had discussions on multicultural and diversity topics in the developmental guidance periods or during individual or group counseling.

Delpit (1995) suggested that school counselors can help teachers minimize cultural barriers and can act as an additional supportive person who can provide literacy to children, which would maximize the effectiveness with the child. We found that other barriers, which are a focus of school counseling programs, also impede student academic achievement. Furthermore, many of the school counselors knew that a proper diet and clothing, social skills, love, support outside of the school, and positive peer interactions were crucial before a child could learn academically. As school counseling programs focus on the socioemotional development of children, they are serving to promote literacy.

Finally, these findings are consistent with Allington's (2001) thesis that school counselors should help struggling readers and be supportive of teachers in literacy development. Although many of the interviewees did not feel they were instructing literacy, they did see that they were promoting and enhancing literacy in their office by reading and writing with children and doing other literacy-based activities besides instruction. Many of the school counselors interviewed stated that before delivering developmental guidance lessons, they would talk with the teachers about current issues in the classroom at the time and then could address the issues (e.g., bullying) via literacy activities or other means in their lessons—thus supporting the teachers.

We suggest that there are some important conclusions regarding the school counselor's role in literacy development that warrant further consideration. First, it is clear that there is a paucity of research in this area, resulting in little empirical evidence to guide research or practice. When the school counselors were initially asked about their roles in literacy, they were often confused as to why the question was even being asked. This speaks to a gap in their training as school-based professionals. Literacy is often viewed as a teacher's role and the school counselor deals only with socioemotional issues. However, after the interviews it was clear that school counselors do have a large role in the promotion of literacy in elementary school students—they just did not realize it. It was well stated by the participants that their ultimate goal when working with children was fostering their socioemotional development and that involvement in literacy-oriented experiences was just a means of achieving this goal. However, after discussion, it became apparent that there is a direct link between socioemotional development and literacy—they go hand in hand. It was very rare to talk about socioemotional development without literacy being a part of the discussion or to discuss literacy without issues of socioemotional development being raised.

While school counselors do have a role in promoting literacy in elementary school students, it is significant to note that often their role in literacy is indirect. Teachers are viewed as having the direct role of promoting literacy because they instruct literacy; however, school counselors promote literacy indirectly because they are using it as a means to achieve an alternative goal—socioemotional development.

A final conclusion is that even though school counselors are promoting literacy, not instructing it, they are not trained or told to do so; they just pick up that responsibility based on the school needs. Some schools may need the school counselors to take on an extra role in literacy development and some may not, depending on contextual considerations. It is also significant to note that the personal view that the school counselor has may also impact his or her role in literacy development. If a school counselor firmly believes that it is not his or her role and was not instructed to do so, he or she is oftentimes hesitant to take on that role of literacy promotion much less admit that it is a role of the school counselor. On the other hand, some school counselors who take on the "team approach" to helping students see literacy promotion as everyone's role and are more likely to be actively involved and admit it is also their responsibility.

We also found that awareness was a key issue, which was explained in the ambivalence-to-enlightenment section. The interviewees who realized how much literacy promotion they do became excited to do more, to recognize what they were already doing as positive, and to be a member of the "literacy bandwagon." Many of the participants did not realize how they specifically promoted literacy, which includes more than simply reading a book with a child.

We suggest that training guidelines for school counselors be altered in order to articulate literacy promotion as a role of the school counselor. It is clear that this assistance and help from the school counselors in relation to literacy is greatly needed; thus, school counselors need to be trained to develop this competence. For school counselors practicing right now, it is important to review current research on this topic and to provide proper training on how to promote and assist in literacy development. It is also important to be aware of the amount of literacy promotion they do and what more they could do to benefit the child, e.g., finding alternative literacy techniques that could facilitate their goals in working with children.

Conclusion

Socioemotional development is a foundation of academic achievement and is the primary goal of school counselors. This chapter indicates that school counselors reinforce socioemotional development in children by using literacy-related techniques. How is a child going to be able to learn academically if he or she has barriers preventing the academic achievement? It is true that a teacher or a reading specialist may instruct literacy and may be the first person called to help a struggling reader; however, who follows through and makes sure that the child is emotionally stable in order to fulfill this academic instruction? Who is the one who connects the socioemotional development with literacy development? That individual is a school counselor. School counselors, both directly and indirectly, reinforce literacy and academic instruction through counseling techniques and developmental guidance. School counselors remove barriers in children's lives and prepare children to succeed academically. School counselors have a critical and valuable impact on the development of literacy and the socioemotional well-being in children's lives.

DESIGNING CULTURALLY RESPONSIVE SCHOOL COUNSELING CAREER DEVELOPMENT PROGRAMMING FOR YOUTH

KIMBERLY A. S. HOWARD
University of Wisconsin–Madison

V. SCOTT H. SOLBERG, NEETA KANTAMENI, AND MELISSA KRAEMER SMOTHERS
University of Wisconsin–Milwaukee

The focus and scope of school counseling has expanded in recent years from a primary focus on work transition to include a comprehensive range of developmental services that address academic, interpersonal, and vocational readiness. Currently, the design of most school counseling programs is on the provision of "comprehensive" services that include a developmental guidance curriculum; individual services to children, youth, and their families; and responsive services (American School Counselor Association [ASCA], 2003; Gysbers, 2001). Recent large-scale evaluations indicate that programs offering comprehensive services result in positive outcomes for youth (Lapan, Gysbers, & Petroski, 2003; Lapan, Gysbers, & Sun, 1997; Sink & Stroh, 2003). Youth attending schools that implement a comprehensive school counseling model reported higher grades and higher achievement test scores; they believed that more career information was available to them, could see the relevance of their current school work to their future endeavors, and perceived a more positive school environment, in terms of feeling safe in school and feeling connected to their teachers (Lapan et al., 1997, 2003; Sink & Stroh). One such study also examined student outcomes by various types of student characteristics, including race/ethnicity and socioeconomic indicators (Lapan et al., 1997). The researchers discovered that, overall, students of color reported lower grades on average than White students did. While comprehensive guidance programs were found to positively influence grades for all students, these programs did not reduce the achievement gap between youth from racially and ethnically diverse backgrounds and White youth or between youth from lower income and higher income backgrounds.

This achievement gap is troubling and deserves immediate attention for we know that youth from low-income and diverse backgrounds are three times more likely to leave high school prior to gaining a degree and that growing up in poverty is the strongest predictor of future unemployment (National Research Council, 1993). Reducing the achievement gap refers not only to increasing high school graduation rates, but also to providing youth from racially and ethnically diverse backgrounds and youth from lower income backgrounds with the skills needed to successfully enter and graduate from 2- and 4-year colleges. Adults with a 4-year college degree earn a median income of $41,800 while those who do not graduate from high school earn a median income of $18,300—a difference of $23,500 per year (U.S. Census Bureau, 2005). When considered over a 45-year work life, this totals more than $1 million. Figure 19.1 breaks down the economic implications of a college degree by racial and ethnic background. While individuals from African American and Latino backgrounds continue to earn less than individuals from White and Asian American backgrounds, the relative income differences that result from having a college degree across all groups is quite staggering.

At the same time, however, we must also keep in mind that economic success is not solely reflected by one's annual income, but also entails avoiding periods of unemployment and poverty. As we would expect, unemployment and poverty rates are closely tied to level of education. In 2003 (U.S. Census Bureau, 2005), 12.5% of Americans lived in poverty. When considering just those individuals who did not complete high school, we see a jump in poverty

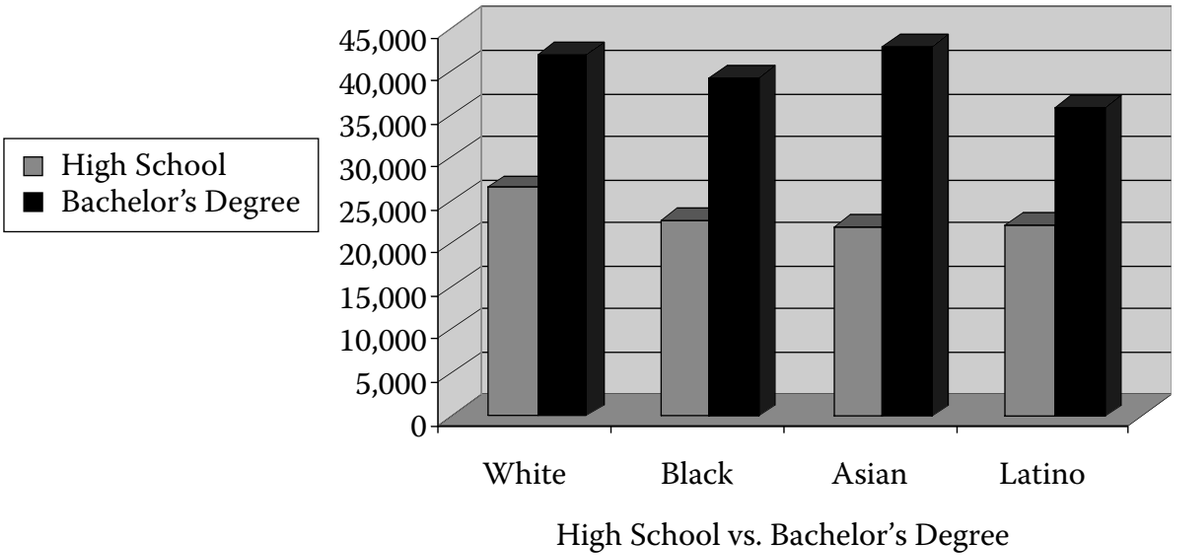

Figure 19.1 Income levels by ethnicity and degree.

rates to 21.3%. This rate steadily declines with additional education; high school degree or GED: 11.3%; some college: 8.5%; and a 4-year degree or more: 4.2%. So, too, does the unemployment rate. Individuals 25 years and older who did not have a high school diploma were almost twice as likely as high school graduates and over three times more likely than those with a 4-year college degree to be unemployed (U.S. Bureau of Labor Statistics, 2005). Figure 19.2 examines poverty rates by academic degree status and by racial/ethnic group. Even among individuals possessing no high school diploma we see differences in poverty rates for African-Americans and Latinos versus their White and Asian-American counterparts.

In short, unless the achievement gap is addressed, serious economic inequities are likely to continue in the United States. One of the most serious signs of the severe inequities occurring in the United States is that the median net worth for individuals from White backgrounds has been estimated at $120,000 compared with $17,000 for individuals from non-White backgrounds (Aizcorbe, Kennickell, & Moore, 2003). By establishing culturally responsive comprehensive school counseling programs that narrow the achievement gap, school counselors are promoting a more socially just society. While some critics of the multicultural movement believe that good practice should work equally

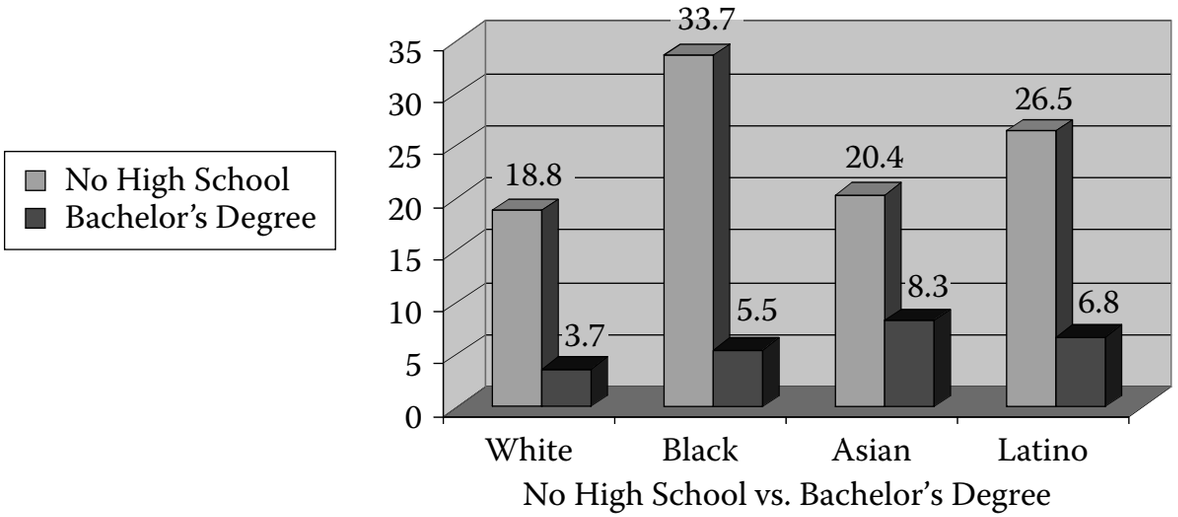

Figure 19.2 Poverty by education level.

for everyone (an assertion with which we disagree), the Lapan et al. (1997) investigation suggested that "working equally well" with all groups, in fact, serves to maintain the status quo of unequal outcomes for culturally diverse and low-income youth. Instead of focusing on strategies that work equally well across groups, we must, instead, turn our attention to strategies that provide opportunities for youth to experience *equal levels of success,* both in school and in their postsecondary plans.

Where, then, do we begin when aiming to provide culturally responsive programs of career development for children and youth? One logical place to start is consulting the *ASCA National Model* of comprehensive school counseling (ASCA, 2003). This model includes four main components: (a) the theoretical foundation underlying the profession, (b) a management system for the school counseling program, (c) a services delivery system, and (d) accountability methods (ASCA). It was designed to support school counselors' efforts to develop and implement a comprehensive, developmentally appropriate program of school counseling. The *ASCA National Model* clearly describes the importance of disaggregating outcome data in order to evaluate whether services are effectively impacting all youth. It does not, however, provide adequate discussion with regard to "how" to design such services in a manner that makes these services responsive to youth from culturally diverse or low-income backgrounds. We agree with the many advocates who have argued that a culturally appropriate school-counseling program begins with both preservice training and professional development opportunities in multiculturally competent counseling (Coleman & Baskin, 2003; Constantine & Yeh, 2001; Hobson & Kanitz, 1996; Schwallie-Giddis, Anstrom, Sánchez, Sardi, & Granato, 2004).

In the remainder of this chapter, we will discuss the topic of culturally appropriate, school-based career interventions for youth. We concur with scholars and practitioners in the field that the application of counseling knowledge and skills to the career domain, as in the academic and personal/social domains, requires an integration of multicultural competence (Arbona, 2000; Hargrove, Creagh, & Kelly, 2003) and a social justice perspective (Vera & Speight, 2003). It requires knowledge of major career theories and contemporary developmental perspectives that are relevant to school-age children and youth. It requires familiarity with the current state of research knowledge in career interventions with youth in school settings, as well as with exemplars of well-developed and effective school-based career intervention programs. Thus, after reviewing the literature on multiculturally competent career counseling and interventions, we will describe a social justice perspective to school counseling and then review relevant theory, summarize the current state of research in school-based career interventions, and describe two examples of career interventions designed for culturally diverse youth. Let us now turn our attention to the role of multicultural counseling competence in school counseling.

Multicultural Competence

Each year the United States' population becomes more and more diverse. It is projected that by the year 2050 people of color will compose roughly 50% of the national population (U.S. Census Bureau, 2005). With the growing diversity in our nation's population comes an increased recognition regarding the importance of working in ways that are knowledgeable, respectful, and affirming of other cultures' ways of being (Carey & Reinat, 1990; Hobson & Kanitz, 1996). D. W. Sue and D. Sue (2003) explained that multicultural counseling competence has historically been conceived of as including three core dimensions: (a) an awareness of one's own cultural self; (b) knowledge of the history, values, and worldviews of various racial, ethnic, and cultural groups; and (c) skills to create and implement culturally responsive interventions. Holcomb-McCoy (2003) explained that for school counselors, practicing in a culturally competent manner demands a "paradigm shift" in how one conceptualizes students and student issues. This shift requires one to understand the influence of a number of factors on students' academic and social functioning at school. These factors include students' racial and/or ethnic identity, language status, and country of origin; their socioeconomic status, social resources, and family status; and their cultural expectations of school counseling. Further, practicing in a multiculturally competent way requires that school counselors appreciate the ways that a student's home, community, and cultural contexts shape how they perceive schooling and their roles as students. Indeed, for Coleman and Baskin (2003), it is the ability to naturally incorporate an understanding of these contexts into the therapeutic process and method of service delivery that captures the "essence" of being a multiculturally competent school counselor.

Previous research found that practicing school counselors recognized the need to become more skilled at working with culturally diverse students (Carey & Reinat, 1990). Specifically, school counselors reported a need for becoming more aware of their own cultural background, more effective in interacting and working with culturally diverse youth, and more aware of how their actions were being perceived by students (Carey & Reinat). More recent research has found that for school counselors, multicultural counseling knowledge and awareness is related to the number of multicultural courses taken previously, a commitment to interacting with culturally diverse individuals, and an appreciation for and a valuing of the ways that

we are all similar as well as different (Constantine et al., 2001). Thus, establishing multicultural competence as a school counselor includes maintaining an appreciation for the diverse ways of being and thinking found across racial and ethnic groups and actively seeking out cultural experiences and new learning opportunities.

Scholars within the field of career development, too, have called for multiculturally competent approaches to the generation and application of career theory, research, and practice (e.g., Betz, 1993; Swanson & Fouad, 1999). Hargrove and colleagues (2003) explained that three foci have emerged in the area of studying multiculturally competent career counseling. These foci include (a) attempts to articulate racial/ethnic group-specific career-counseling guidelines, (b) the identification of culturally appropriate principles of career counseling that may be used with all clients, and (c) the creation of multicultural career-counseling competencies. Seeing the need for a model of multiculturally competent career counseling to guide the work of practitioners and scholars, Hargrove et al. proposed a three-part framework based, to some extent, on the multicultural counseling competencies of the American Counseling Association (ACA). Consistent with D. W. Sue and D. Sue (2003), this framework includes the importance of career counselor self-awareness, awareness of the client's worldview, and the development and use of culturally appropriate interventions and strategies.

It is hard not to recognize that becoming multiculturally competent is critical for success as a school counselor. At the same time, however, we argue that multicultural competence is a necessary, but not a sufficient condition for working in optimal ways with culturally diverse and low-income youth. The disparities apparent in high school graduation rates, college attendance, incomes, poverty rates, and unemployment rates make it clear that a more proactive stance is needed to address the differential life outcomes experienced by our young people. We concur with Vera and Speight (2003) who argued that multiculturally competent practice will be limited in its impact without a focus on promoting a more socially just world. It is our contention that in order to be well prepared to provide appropriate and culturally relevant career development services, one must adopt a social justice perspective.

Social Justice Perspective

While the multicultural competencies (American Psychological Association, 2003) describe the characteristics and qualities necessary for working with individuals from diverse cultural backgrounds, a social justice perspective expands the role of school counselors to include efforts to change the school context in ways that promote academic, interpersonal, and vocational success for youth. From a school-based social justice perspective, the primary goal is for youth to experience power and the ability to influence their academic and life outcomes in self-determined ways (Howard & Solberg, 2006). According to Prilleltensky (1997), traditional service delivery methods focus on working with individual clients in ways that encourage them to take ownership of the problem and establish a plan for ameliorating it. Traditional methods assume that problems lie within the individual and that the individual possesses the ability to address the problems that he or she may have in a relatively independent manner. Cognitive therapeutic methods, for example, focus on the beliefs of the individual as the source of the problem; treatment consists of helping the individual learn to become aware of the problematic thoughts and to actively challenge and replace them with more effective thoughts.

Prilleltensky (1997) articulated an Emancipatory Communitarian (EC) framework that is notably different from traditional service delivery methods. The EC framework identifies problems as being relational, such that both the individual and the context in which one finds one's self share responsibility for the development of the problem as well as its solutions. In school settings, the EC framework seems particularly applicable because school counselors can work with youth and the school context. For example, one of the authors helped a school decrease its truancy rate by working with the administration to establish a new late-arrival policy. Rather than having tardy youth wait in an atrium outside of school until they were processed one at a time, a new procedure was enacted whereby all youth who were late to school entered the cafeteria. Two things occurred when they entered: First, opera music playing, creating a situation that these youth found to be "unpleasant." Second, the students completed a short survey about the reasons for their tardiness. A paradox was created by the school whereby youth avoided being late so they did not have to listen to the opera music. As a result, the number of students late for school dropped substantially within 2 months time from approximately 100 per day to fewer than 25.

At the same time, an examination of youths' written statements regarding their tardiness revealed that many of them had legitimate reasons for being late. The administrators realized that it was not uncommon for these students to be responsible for dropping off siblings at elementary school in the morning making them late as a result. Now the administrators knew that many of these students wanted to arrive on time, but had family responsibilities that prevented them from doing so. Armed with this knowledge, they began to work with these students differently to address their tardiness. Such an intervention is consistent with an EC framework because the context that contributed to the problem was being addressed in ways

that prevented the problem of late arrival from occurring while simultaneously empowering youth to influence the perceptions of administrators by writing down their reasons for being late.

A social justice perspective in school settings defines the problematic behavior of a student as an interpersonal problem between the individual and the context within which the problem occurs. As such, solutions to problem behaviors must involve changing both the individual and the context. From this perspective, youth are perceived as having potential, while the context is perceived as either facilitating the development of or subverting this potential. Rogers (1961) argued that at the root of one's problems are interpersonal relations that provide conditional regard. Within such contexts, one is challenged to actualize one's true potential. These types of contexts are deemed "oppressive" in nature. Currently, large populations of youth from diverse cultural and economic backgrounds are not achieving to their true potential, as indicated by persistent achievement gaps in standardized and college entrance examinations, differential dropout rates, and lower college participation rates (National Center for Education Statistics, 2001). This suggests that, at best, many schools are failing to facilitate equal levels of achievement across students and, at worst, they are contributing to oppressive conditions experienced by youth. Oppression occurs through policies and procedures that result in differential educational and economic outcomes for specific groups of individuals in our society. In the truancy example just discussed, administrators initially felt at some level that students were late for school because they did not value the importance of being on time and were not interested in learning. Waiting outside in the building atrium on a cold morning communicated to the students that the school did not care about their well-being. The school policy that required youth to wait outside and enter one at a time only contributed to the problem because any student anger was interpreted by school administrators as further evidence that they were not interested in school. Reorganizing the rules for being late facilitated more positive patterns of behavior in three ways: First, moving the youth inside to the cafeteria was appreciated by the students. Second, the opera music that was played created a different motivation for arriving on time. And, finally, students' written explanations for their chronic tardiness challenged the administrators' assumptions as to why students were late for school.

While changing the rules and resources that contribute to maintaining oppression is certainly important, according to Freire (1970), oppression operates most significantly at the psychological level. He argued that individuals in the oppressed category and individuals in positions of power share common beliefs that maintain the status quo. From this perspective, battling oppression is accomplished when both individuals—the oppressed and oppressor—become aware of their own unconscious beliefs and how the rules and resources within the context contribute to the problem. Friere's position allows schools to move away from attributing blame to focus instead on becoming aware of the shared responsibility that the school context has in maintaining differences in academic achievement. There is no doubt that youth from culturally diverse and lower economic backgrounds enter school with different levels of readiness. And there is no doubt that many families from lower income communities are working in jobs that do not allow them to participate as fully in their child's education as they would like. School counselors engage in EC when they work with their school to identify ways to address these challenges so that all youth achieve their highest potential.

In multicultural counseling, research has identified a number of models for understanding how unconscious belief patterns—worldviews—impact behavior. Four lines of research drawn from the multicultural literature are described here, including false versus critical consciousness, racial identity development models, White racial identity development models, and collectivism versus individualism. Each of these models offers school counselors useful tools for assessing how both students and educators approach their racial identity and their understanding of racial issues. Thus, an understanding of these models is important for the provision of culturally responsive career programs in schools.

False Versus Critical Consciousness

Recently, Quintana and Segura-Herrera (2003) catalogued the unconscious beliefs that influence one's racial identity into two categories. They described false consciousness as being marked by an internalized inferiority and mental colonization—a situation in which the oppressed have been convinced of the legitimacy of their oppression. Alternatively, critical consciousness is described as "contesting the legitimacy of the oppression . . . without reifying negative in-group stereotypes" (p. 275). Quintana and Segura-Herrera also described the conditions necessary for the development of critical consciousness. They explained that engaging in a critical examination of oppression and of the claims of "truth" used to justify it requires a certain level of sophistication of social cognitive abilities. They explained, "Being able to formulate a generalized group perspective for other racial groups provides an important development in the ability to contest the legitimacy of oppression as well as the truth claims attempting to justify the oppression" (p. 279).

Racial Identity Development Models

Other models of identity development attend to the degree to which individuals from diverse racial and ethnic backgrounds share in majority culture perspectives and practices, react against the majority culture, or have established integrated perspectives that allow them to participate in society in a self-determined manner (Ponterotto & Pederson, 1993). Although several models have dominated multicultural literature over the past several decades, the Minority Identity Model developed by Atkinson, Morten, and Sue (1998) includes many of the characteristics of these models. One shared feature is that these models consist of different worldview orientations (initially referred to as developmental stages). The first worldview orientation of the Atkinson et al., model is related to conformity to the majority culture. This worldview is characterized by the individual from a culturally diverse background maintaining a clear preference for the majority cultural values over their own cultural values. The second worldview orientation is labeled Dissonance and Appreciation. This worldview is characterized by the individual questioning and challenging of one's own beliefs and values, specifically those related to the assumptions regarding majority culture values. The third worldview orientation is entitled Resistance and Immersion. Individuals within this orientation actively challenge their beliefs and tend toward endorsing views and beliefs from their culture of origin while rejecting the majority culture values and beliefs. The fourth worldview orientation is Introspection. Individuals within this orientation begin to evaluate the efficacy of values and beliefs from both their culture of origin and the majority culture. Finally, the Integrative Awareness worldview orientation occurs when individuals develop an inner sense of security and an appreciation of one's cultural values and beliefs as well as the dominant culture's values and beliefs (Atkinson et al.).

White Racial Identity Development Models

A social justice perspective involves consciousness raising on the part of the individuals within the oppressed position *as well as* individuals within positions of power. The White Racial Identity Development model was established for individuals from White cultural backgrounds to evaluate the degree of conscious awareness they have developed regarding race and factors that maintain oppression (Helms, 1984, 1995). Helms (1995) described the worldview orientations as ego statuses and elaborated on the dynamic process involved in racial identity. According to Helms, the first ego status is called Contact Status. A person who possesses a Contact Status worldview orientation is one who lacks complete awareness of racism and factors within his or her community that contribute to racial differences. The Disintegration worldview orientation is characterized as an existential conflict the individual experiences whereby he or she begins to understand that differences do exist in how people from different racial/ethnic groups are treated, but simultaneously want to believe that his or her values and beliefs do not contribute to these differences. The Reintegration worldview orientation often evolves from the Disintegration orientation whereby the individual regresses to a pro-White values orientation and perception of inferiority as the main cause for perceived racial differences. The Pseudoindependence worldview orientation often occurs when a person is finally faced with an experience of injustice that cannot be accounted for by inferiority attributions. Such an orientation may involve renewed efforts at helping individuals from culturally diverse backgrounds to understand the White values and beliefs in order to avoid future injustice. The Immersion/Emersion worldview orientation involves becoming aware of White privilege and the ways that one contributes to racism. As a result, the individual is likely to become involved in efforts to educate other individuals from White backgrounds about privilege and work to actively intervene against racism. The Autonomy worldview orientation involves the strengthening of one's own understanding of one's White privilege and increasing understanding of the role one plays in supporting the continuation of racism.

Collectivism Versus Individualism

Another identity model evaluates whether the society in which a person lives operates according to an individualist or collectivist worldview orientation (Triandis, 1995). Individualist societies are those that value autonomy and perceive normal human development in terms of separating from the family through the articulation of unique and personal goals and attributes. Societies that value individualism are characterized as highly competitive and support meritocracy based on individuals' competing for status, recognition, and achievement.

Other societies rely on a collectivist orientation that values family over individual goals and cooperative versus competitive work environments. Collectivist cultures often have an interdependent nature, placing the needs and interests of the larger group over the desires of individuals (Triandis, 1995). This is clearly displayed within the family, when individuals in the family are expected to work together to fulfill needs and goals. Individuals with a collectivistic orientation often consider the benefits for everyone in the group not just individual needs. Thus, when they compete, they work to gain status, recognition, and achievement for their group as a whole. This orientation is sometimes hard for individuals in the mainstream U.S. culture to understand and is often overlooked when work-

Sample Characteristics of a Social Justice Perspective

- School counseling must contribute to achieving social equality and economic inequity by establishing culturally relevant strategies for narrowing the achievement gap.
- The achievement gap results from oppression operating in school settings and communities that contribute to youth from culturally diverse and low incomes from performing below their true potential.
- Intervention strategies battle against oppression when they help educators challenge prevailing worldviews that contribute to educational inequity.
- Intervention strategies battle against oppression when they establish intervention strategies that help youth experience power to influence their academic, interpersonal, and vocational outcomes.
- Problems youth experience are perceived as emerging from interpersonal problems between the individual and the context.

Figure 19.3 Social justice perspective.

ing with clients. Many times over, certain clients have been described as "dependent" without a thorough examination of their cultural background (Sue & Sue, 2003). From this perspective, oppression can also occur when someone whose culture of origin is collectivist is living within a society that values individualism. Oppression occurs when the individual in the oppressed position values a collectivist worldview while the person in the position of power values and judges others from an individualist worldview.

Social Justice and School Counseling

In order for school counselors to effectively address the academic, interpersonal, and vocational development needs of youth from diverse cultural and low-income backgrounds, they must maintain a social justice perspective that incorporates multicultural competence and an understanding of the complex individual and context interactions that maintain differential rates in achievement and life success (Figure 19.3). As such, school counselors must perceive their role as intervening both with youth and with the school context in order to eradicate the achievement gap, lower dropout rates, and increase the number of youth from diverse and low-income backgrounds participating in postsecondary education. At the core of these interventions are unconscious beliefs that are held by both youth and educators. Many of these beliefs consist of patterns, or worldview orientations, that can be understood in terms of the degree to which they possess a critical consciousness of their racial and ethnic background, their level of identity development, and/or the collectivist versus individualist perspective they hold (Figure 19.4).

In sum, the unequal academic, career, and economic outcomes of diverse and low-income youth require that school counselors develop and provide culturally responsive programs of career development. Such an undertaking necessitates the development of multicultural competencies and an adoption of a social justice perspective on the part of school counselors. It also requires school counsel-

Worldview Conceptualizations

False versus Critical Consciousness (Quintana and Segura-Herrera, 2003)

For individuals from culturally diverse backgrounds, false consciousness is characterized by internalized inferiority beliefs that result from sensing legitimacy of prevailing oppressive forces existing in one's community. Critical consciousness is achieved by challenging sources of oppression and claims of "truth."

Racial Identity Models (Ponterotto & Pederson, 1993)

For individuals from culturally diverse backgrounds, these models describe a number of worldview orientations associated with the degree of conformity to majority culture values and beliefs versus movement toward appreciation and value for one's own culture of origin.

White Racial Identity Models (Helms, 1995)

For individuals from White ethnic backgrounds, this model describes worldview orientations associated with becoming aware of racism and oppression. Worldviews range from a complete lack of awareness of racism to possessing an understanding of how one's personal privilege status contributes to racism.

Individualism versus Collectivism (Triandis, 1995)

Describes how cultures vary according to worldview orientations associated with individual, personal goals versus family, collective goals. Collectivist worldview orientations are associated with valuing cooperation versus competition, down playing personal achievements for the collective efforts, and maintaining group harmony versus striving for individual goals.

ors to be knowledgeable of both common and contemporary theoretical approaches to understanding the career development of youth. The next section of this chapter will briefly summarize relevant career theories and models of development.

Vocational and Career Development: Past and Present

Vocational guidance traces it roots to the beginning of the 20th century. During this time, the United States was experiencing frequent waves of immigration, an increasing industrialization of the work world, and a growing number of individuals and families moving from rural to urban areas. It was in this time that Frank Parsons (1909) established the Vocations Bureau in Boston, Massachusetts. The purpose of this bureau was to help youth and adults assess their interests and skills, learn about the world of work, and identify work opportunities that would allow them to utilize their skills while providing enjoyable work activities. Parsons argued that choosing a vocation involves the following three conditions:

> First, a clear understanding of yourself, aptitudes, abilities, interests, resources, limitations, and other qualities. Second, a knowledge of the requirements and conditions of success, advantages and disadvantages, compensation, opportunities and prospects in different lines of work. Third, true reasoning on the relations of these two groups of facts. (p. 5)

Parsons' early vocational work laid the foundation for the later person–environment fit models of vocational development (Baker & Gerler, 2004; Schmidt, 1999).

At the same time that Parsons was establishing the Vocations Bureau, early pioneers in this field were establishing vocational guidance programs in schools (Baker & Gerler, 2004; Schmidt, 1999). Individuals such as Anna Reed, Jesse Davis, and Eli Weaver (Gibson & Mitchell, 2003) were designing and implementing programs to assist youth in transitioning into the world of work. In 1910 Boston Public Schools became the first school district in the United States to begin assigning vocational counselors to elementary and secondary schools (Gysbers, 1997).

Beginning in the 1920s, Western countries saw the rise of the psychometric movement—a movement that was fueled by the development of intelligence testing by Binet in France. During World War I, the American military developed and began using the Army Alpha Test—an assessment designed to quickly determine the best placement for recruits. Soon, vocational guidance counselors began using testing techniques to determine the interests, personality characteristics, and relative strengths and weaknesses of their clients and, in school settings, youth (Baker & Gerler, 2004; Gibson & Mitchell, 2003; Schmidt, 1999). The decades of the 1950s and 1960s were intense periods of theory development in vocational psychology. During this period, theorists such as Ginzburg, Holland, Roe, Super, and Tiedeman provided professionals of career development with conceptual frameworks in which to ground their work (Schmidt).

Alarmed by the Soviet Union's successful launch of the Sputnik I satellite in 1957, the U.S. Congress passed the National Defense Education Act of 1958 (Public Law 85-846, U.S. Congress, 1958). Among other things, this act provided funding to high schools to identify and guide talented students into careers deemed as critical to the national good. It also improved and expanded school counselor preparation programs to meet the guidance needs created by the new NDEA funding. As a result, within the next 10 years the number of counselors in schools increased fourfold (Baker & Gerler, 2004; Schmidt 1999; U.S. Congress, 1958). Whereas traditional vocational guidance focused on helping youth transition into the world of work, the NDEA shifted the focus of the field to include the identification of individuals with math and science aptitude. These youth were often tracked into special course offerings to further develop their math and science skills.

Recent changes in the world of work and the advent of standards-based education (e.g., No Child Left Behind) have changed the role of vocational guidance, and with that has come a change in title from vocational guidance to school counselor. Current conceptualizations of the role of school counselors organize the foci of their work into three developmental domains: (a) academic, (b) interpersonal, and (c) vocational (ASCA, 2003). It is not uncommon for today's school counselors to feel pulled in multiple directions. Schools need school counselors to support their school improvement efforts to meet grade-level expectations as mandated under new federal legislation. Yet, youth will not be prepared to enter the world of work without requisite readiness skills. The Secretary's Commission for Achieving Necessary Skills (Resnick & Wirt, 1996; SCANS, 1992) provides a template of academic, social, technology, and related readiness skills that youth will need to be competitive in today's world of work. While it appears that school counselors are being faced with a multitude of responsibilities, the methods needed for being effective in each task are not mutually exclusive. For school counselors working with youth from culturally diverse and low-income backgrounds, their support of efforts to increase youth literacy and numeracy test scores, for example, can

also result in improvements in academic achievement as well as better postsecondary readiness skills. Both of these outcomes position youth better for their post-high-school plans. In other words, school success is the foundation for career development.

Traditional Career Development Perspectives

Presently, vocational psychology and career development theory can be divided into three categories: (a) person–environment fit theories, (b) developmental theories, and (c) social cognitive theories.

Person-Environment Fit Theories

The rise of survey assessment methods in the early and mid-1900s brought about an emphasis in personality measurement. Assuming that personality consists of stable "traits," it was possible to identify the traits a person possessed and then match the individual to the types of work environments that effectively used those traits (Chartrand, Strong, & Weitzman, 1995). Holland's (1996) theory of vocational types and work environments is one of the best known person–environment fit theories. His Self-Directed Search (SDS) instrument allows youth to select from a variety of interests, skills, and occupations in order to generate scores that vary along six personality types: (a) realistic, (b) investigative, (c) artistic, (d) social, (e) enterprising, and (f) conventional. According to Holland, the six personality types emerge as dispositions within complex family contexts. While genetics plays a role in the formation of these types, interactions within the family and community shape their development. From a social justice perspective, the issue is whether youth from culturally diverse or low-income backgrounds receive the same range of opportunities for developing their personality type. While a family from a low-income background may expose their child to realistic-type experiences, corresponding assessment evaluations may confirm a realistic personality type, but one must wonder if there is a range of other dispositions that could emerge if the learning contexts offered other experiences. With art, music, and theater programs being cut from many schools in lower income areas, it is possible that youth may have a disposition for artistic-related career interests but may not be provided the opportunity to develop this part of their personality.

Holland (1996) recognized that personality does not consist of hard-wired traits. As dispositions, these types can be modified and will change through interactions with the environment. As a consequence, school counselors should consider waiting to use interest assessments until after they have provided youth with opportunities to explore different interests. The caution against interest assessment is advised especially for youth who have experienced lower academic achievement. Interest assessments designed to help these youth explore how their personality types may fit within the world of work and postsecondary opportunities should occur after they have experienced school success and have developed the confidence that they can succeed in school. Otherwise, their results will be more indicative of their low academic self-efficacy than their true interests or potential.

Developmental Theories

Developmental theories of vocational psychology focus on helping youth develop a healthy self-concept. Super's Life-Span, Life Space theory is the best known of these theories (Super, 1953, 1990; Super, Savickas, & Super, 1996). Similar to person–environment fit models, this theory views career choice as an extension of one's self-hood processes. Super posited that each individual carries with him or her a unique set of interests, abilities, goals, and values. Work settings, too, have unique combinations of values, abilities required, etc. Individuals, by virtue of their constellation of interests, values, and abilities, can "fit" well within various types of work settings (Super, 1953, 1990; Super et al., 1996).

According to Super (1953, 1990), individuals construct self-concepts (e.g., of self as worker) through feedback from themselves and important others. Self-concepts develop throughout childhood and adolescence and become relatively stable as an individual matures. Super et al. (1996) defined self-concept as "a product of the interaction of inherited aptitudes, physical makeup, opportunity to observe and play various roles, and evaluations of the extent to which the results of role-playing meet with the approval of supervisors and peers" (p. 125). Occupational choice is one instance of the implementation of self-concepts. Thus, this theory posits that career choices are influenced by one's natural abilities and acquired skills, one's occupationally related experiences, vicarious learning, and feedback from significant others such as parents, authority figures, siblings, and peers. School counselors can support the development of a healthy self-concept by providing elementary and middle school youth with world-of-work experiences. By visiting various work environments and meeting individuals from similar cultural or socioeconomic backgrounds, youth have the opportunity to meet important role models. During adolescence and into young adulthood, school counselors should offer experiences that help youth explore career options, learn how to secure selected career options, and develop a plan of action with regard to

how they will begin realizing these career options (Super, 1953, 1990; Super et al.).

Social Cognitive Theories

Social cognitive theories of career development make up the third general category of career theories. Emerging from the application of Bandura's (1986) social cognitive theory to vocational development (Betz & Hackett, 1981), social cognitive career theory (SCCT) is a model of vocational development that focuses on how one's occupational self-efficacy beliefs determine the direction of one's career interests (Lent, Brown, & Hackett, 1994). According to Bandura, self-efficacy is defined as the confidence one feels in one's ability to successfully perform a specific task. Occupational self-efficacy refers to one's confidence in his or her ability to perform tasks associated with specific occupations. Betz and Hackett's seminal application of Bandura's work found that women who were confident in their ability to complete math and science related tasks expressed stronger career interests in those fields. In the context of 1981, women were facing a number of challenges with regard to entering what at that time were termed "nontraditional" careers.

Bandura (1986) has empirically validated four ways in which the learning context could be designed to promote self-efficacy. An individual's confidence beliefs associated with a given occupation increase when he or she is provided with learning opportunities that offer mastery experiences, modeling (vicarious) experiences, verbal persuasion, and anxiety management (Bandura). Mastery experiences involve the successful performance of the targeted skill, while modeling refers to watching someone successfully perform the skill. Verbal persuasion involves someone such as a school counselor or teacher expressing a belief in the person's ability to successfully perform the task by pointing out other related skills the person possesses. The final source refers to developing the skills needed to manage the anxiety often associated with learning new tasks. Breathing and relaxation exercises are two avenues for helping in this regard.

Fouad and Smith (1996) tested the social cognitive career theory with a diverse population of predominately Latino and African American, urban middle school youth. Consistent with social cognitive career theory, results indicated that self-efficacy expectations related to math/science, decision-making, and outcome expectations were associated with career interests in math and science. Also, interest in math/science careers was related to intentions to complete math and science courses and, unexpectedly, self-efficacy was also directly related to these intentions. Fouad and Smith also found a strong relationship between self-efficacy and outcome expectations; that is, youth who felt able to successfully perform math and science tasks also believed that math and science pursuits would help them achieve desirable outcomes.

Bandura's social cognitive theory has also been applied to "career search self-efficacy" (V. S. Solberg, 1998) and academic self-efficacy (Multon, Brown, & Lent, 1991). Career search self-efficacy refers to an individual's confidence in his or her ability to successfully perform career search tasks such as exploring career values and interests, conducting job interviews, seeking out information about possible careers, and networking with peers and others who may offer job leads. Career search self-efficacy has been found to be linked to a number of interpersonal and vocational outcomes. Individuals with high career search self-efficacy have indicated higher assertiveness and more career readiness, and they have engaged in more career exploration (V. S. Solberg, 1998). Academic self-efficacy refers to one's confidence for performing specific classroom learning tasks such as reading textbooks, asking questions, and relating to peers. This type of self-efficacy has been found to be an important determinant of school success. In a meta-analysis of the literature, Multon et al. found that academic self-efficacy yielded a medium effect size with regard to school outcomes. This means that academic self-efficacy should be considered a central contributing factor in school performance. Youth with higher academic self-efficacy expectations are more likely to perform better, persist longer when performing challenging tasks, and approach challenging tasks rather than avoid them.

The SCCT model has also been extended to the study of school engagement. Recently, Wettersten et al. (2005) successfully created and tested such a model with rural high school youth. Specifically, they found that students' academic self-efficacy and outcome expectations, career outcome expectations, perceived level of social support, and parents' involvement in their education accounted for 40% of the variance in their school engagement attitudes. While not as strong, results also indicated that this model successfully predicted a significant amount of the variance in school engagement behaviors, such as time spent on various academic courses. In sum, the SCCT model is a useful tool for school counselors wishing to create programs that support youths' school engagement as well as their academic and career development.

Social Justice and Traditional Career Theory

Person-environment fit approaches were initially used with adult populations in order to help match personality traits to occupations that were deemed to support those traits. As mentioned earlier, we caution the use of interest assessments with youth for a number of reasons. First, with regard to youth development, personality is in formation during

childhood and adolescence, and there are differences of opinion with regard to whether personality consists of traits or modifiable dispositions (Lerner, 2002). Consistent with life-span, life-space theory, it is essential that all youth receive a full range of opportunities to explore the world of work and become aware of the relevance and value of education to one's developing identity. Moreover, school counselors should focus their efforts on collaborating with educators in schools to establish the conditions for optimal growth and development. Social cognitive applications to career development describe four sources of self-efficacy beliefs that can be used to design such experiences. In addition, a number of contemporary developmental perspectives are described here that offer additional ideas in regard to designing school experiences in ways that maximize youth development (Figure 19.5).

Contemporary Developmental Perspectives

Developmental Contextualism

Developmental contextualism (DC; Lerner, 1995) is a metatheory that describes how academic, interpersonal, and career development emerge from complex interactions between youth and the various systems in which youth are embedded. Drawing from Bronfenbrenner (1979), three interrelated systems include (a) microsystems, (b) exosystems, and (c) macrosystems. Microsystems involve direct interactions youth encounter in school, home, and community. Exosystemic factors indirectly impact youth development through their influence on microsystems.

Traditional Career Development and Contemporary Developmental Theory

Person–Environment Fit (Chartrand, Strong, & Weitzman, 1995)

Successful transitions into work are expected when individuals make career decisions that represent a fit between personality traits and skills, and occupations that need those traits and skills. Assessment tools are often used to evaluate personality traits, interests, and skills and then offer individuals a fit index with regard to a range of occupational possibilities.

Life-Span, Life Space (Super, Savickas, & Super, 1996)

Evaluates the role of work as one role within the person's self-concept. Developmental in nature, this theory encourages exposure to various occupational settings in order to help individuals develop an understanding of different opportunities.

Social Cognitive Theory (Bandura, 1986)

From social cognitive theory, the concept of self-efficacy has been applied to career development through the Social Cognitive Career Theory (Lent, Brown, & Hackett, 1994), academic self-efficacy (Multon, Brown, & Lent, 1991), and career search self-efficacy (V.S. Solberg, 1998. This theory provides four developmental sources of self-efficacy which has been defined as one's confidence to successfully perform a targeted task.

Developmental Contextualism (Lerner, 2002)

A meta-theory that conceptualizes development in terms of human potential being realized only through supportive contexts that effectively promote growth. As such, the context – such as the school or classroom – becomes the focus of interventions rather than the individual.

Developmental Assets (Search Institute, 2002)

The Search Institute has identified 40 individual and contextual factors that promote optimal development. Divided into 20 external (i.e., contextual) and 20 individual characteristics, youth possessing more assets and who are embedded in environments that offer more assets demonstrate better academic outcomes.

Selection, Optimization, and Compensation Model (SOC) (Baltes, 1997)

Research indicates that helping individuals make better life transitions occurs when they learn how to select a few goals, optimize their chances of achieving a goal by taking advantage of opportunities to develop the skills, and are able to compensate by selecting back-up goals when challenges are too great.

Self-Determination Theory (Deci & Ryan, 1985)

Individuals who are learning in environments in which they feel connected to adults in authority and peers will perform the activities because they are enjoyable and meaningful. In school settings, youth will become motivated to engage in school when interventions focus on building stronger relational connections between youth and their teachers and peers.

Figure 19.5 Traditional career development and contemporary developmental theory.

For example, the quality of work available to a parent or guardian impacts youth through the amount of financial resources available to the home and the energy and enthusiasm the parent or guardian may have when at home. Differential school resources impact youth in relation to quality of textbooks, access to technology, and the quality of the school environment. McLoyd (1998) described in detail how living in lower income communities severely impacts one's ability to actualize his or her true potential. Macrosystems involve the cultural context and history of the community and society. One primary assertion in DC is that the various systems in which youth interact are interconnected such that change in one area can impact other areas. While it is clearly understood that what happens in students' home lives can seriously impact their school performance, from a DC perspective, the school counselor can still promote development even though he or she may not be able to intervene directly in the family system. Instead, school counselors can provide opportunities for youth to learn how to cope with these home pressures, and thus indirectly support the well-being and continued academic success of their students. In severe situations, school counselors can mobilize social service providers in the community to provide support and intervention. As the home becomes more stable, youth will be better able to focus on learning. As such, positive development and change that occur in school impact home and vice versa. DC also emphasizes that the impact of school-based interventions that help at-risk youth generate conceptions of self as a "competent learner" can extend beyond the school walls. This new conception of self can serve to encourage youth to seek out experiences both at home and in the community that support and reinforce the belief that one is a skilled and curious seeker of knowledge (Ford & Lerner, 1992). With regard to school counseling, DC conceptualizes education as a powerful learning context that can positively shape youth development, regardless of income levels and home situations. Consistent with the *ASCA National Model* (ASCA, 2003), DC challenges school counselors to examine the types and quality of the learning experiences they offer to youth and to design such experiences so as to facilitate youths' realization of their true potential with regard to academic, interpersonal, and vocational development.

Developmental Assets

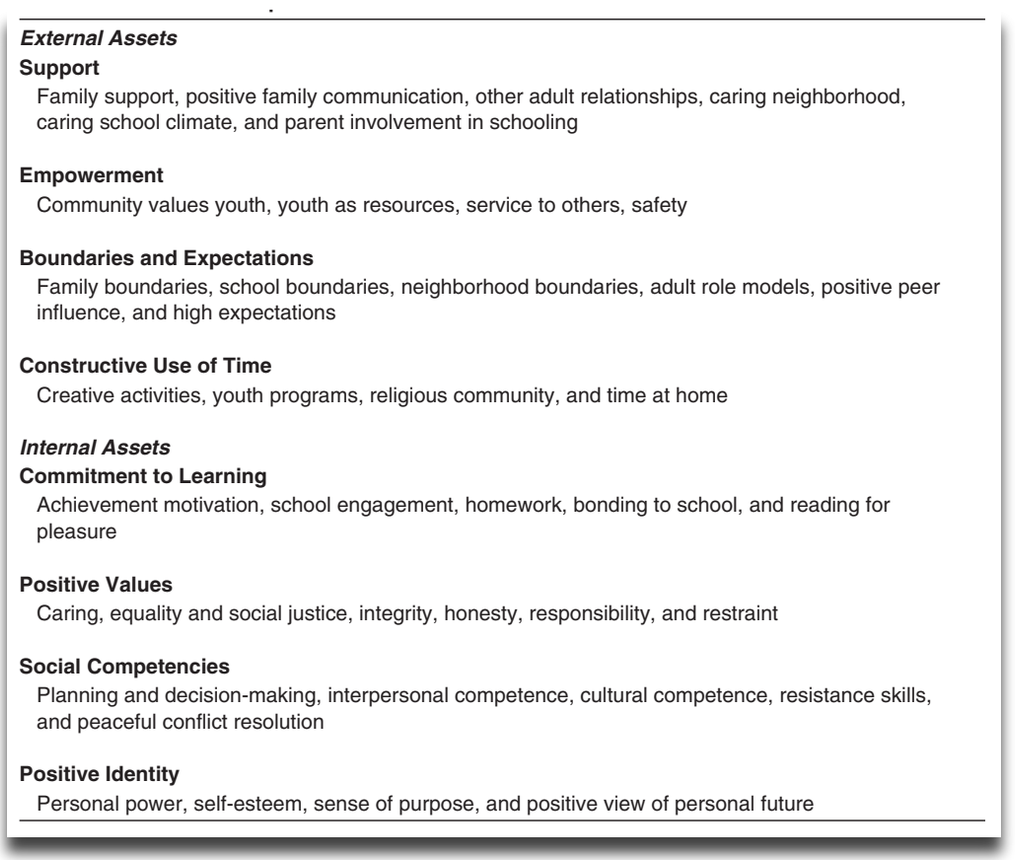
The Search Institute in Minnesota has been studying the individual and contextual variables—called developmental assets—that support positive youth development. They have identified 40 developmental assets that include 20 external and 20 internal assets. The 20 external assets are organized into four categories that include (a) support, (b) empowerment, (c) boundaries and expectations, and (d) constructive use of time. Similarly, the 20 internal assets are also grouped into four categories: (a) commitment to learning, (b) positive values, (c) social competencies, and (d) positive identity. Research indicates that youth who reported possessing more assets are found to experience better life and academic outcomes (Figure 19.6). In a longitudinal study conducted by Scales and Roehlkepartain (2003), it was found that the level of developmental assets present in youths' lives during the ninth grade was significantly correlated with their ninth-grade GPA. This relationship continues to exist even after controlling for gender, family composition, socioeconomic status, and race/ethnicity (Scales & Roehlkepartain; Sesma & Roehlkepartain, 2003).

Selection, Optimization, and Compensation Model

The selection, optimization, and compensation (SOC) model developed by Paul Baltes and colleagues (Baltes, 1997; Freund & Baltes, 1998) contends that there are three sets of strategies that individuals use in their strivings to be successful. Individuals are more likely to achieve their desired goals when they (1) selectively choose future goals, (2) develop methods to optimize their chances for success, and (3) utilize compensatory strategies when faced with barriers or losses. Thus far, this model has effectively predicted positive health outcomes among aging (Freund & Baltes) and adult populations (Wiese, Freund, & Baltes, 2000). Application of the SOC model to youth populations seems especially relevant to youth career interventions because it focuses not just on selecting an occupational choice, but also on how youth maximize the skills and opportunities available to them in order to achieve the occupational choice, as well as how they manage when the path to that occupational choice is particularly challenging or potentially blocked.

Self-Determination Theory

Self-determination theory describes a model of motivation that focuses on four reasons youth will perform a task, such as attending school. Whereas social cognitive theory focuses on youth's belief in their ability to perform a task, self-determination theory (Deci & Ryan, 1985) is concerned with *why* youth are motivated to perform the task. While social cognitive theory is concerned with whether "I think I can" perform the task, self-determination theory is concerned with "why do I want to" perform the task. According to self-determination theory, there are four types of motivation involved in performing a task—two external



External Assets

Support

Family support, positive family communication, other adult relationships, caring neighborhood, caring school climate, and parent involvement in schooling

Empowerment

Community values youth, youth as resources, service to others, safety

Boundaries and Expectations

Family boundaries, school boundaries, neighborhood boundaries, adult role models, positive peer influence, and high expectations

Constructive Use of Time

Creative activities, youth programs, religious community, and time at home

Internal Assets

Commitment to Learning

Achievement motivation, school engagement, homework, bonding to school, and reading for pleasure

Positive Values

Caring, equality and social justice, integrity, honesty, responsibility, and restraint

Social Competencies

Planning and decision-making, interpersonal competence, cultural competence, resistance skills, and peaceful conflict resolution

Positive Identity

Personal power, self-esteem, sense of purpose, and positive view of personal future

Figure 19.6 Search Institute's developmental assets. (Reprinted with permission from *The Asset Approach: 40 Elements of Healthy Development.* Copyright © 2002 by Search Institute℠, Minneapolis, MN.)

and two internal. The two external reasons include performing the task so that others will not be let down or feeling forced to perform the task. The two internal reasons include performing the task because it is enjoyable or because it is perceived as meaningful. Self-determination theory also prescribes the conditions within which youth will be more likely to perform the tasks because it is enjoyable or meaningful. These include learning contexts in which youth feel strong connections to their teachers and peers.

A study by Close (2002) integrated social cognitive and self-determination theories in a study of predominately Latino urban high school youth. She found that students reporting stronger connections with teachers and peers were more likely to report that they attended school because it was meaningful and enjoyable (internal motivation). She also found that students who were confident in their ability to perform the academic tasks (academic self-efficacy) and were attending school because it was enjoyable and meaningful recorded higher attendance and grades. The implication of this research is that the sources of self-efficacy and internal motivation can be found in the classroom context. Armed with an understanding of how to promote the development of academic self-efficacy and internal motivation, school counselors can work with teachers in classroom settings to create optimal learning contexts (V. S. Solberg, Howard, Blustein, & Close, 2002).

Career Interventions Research

Career development research with youth has not enjoyed the same level of interest as research on career development of adults, especially college-aged adults (Whiston, Sexton, & Lasoff, 1998). Similarly, research assessing the impact of career *interventions* is not conducted as readily as research that examines aspects of career development more generally. Nevertheless, there is much to be learned from a review of the small body of available career intervention research with youth. This research has covered such diverse topics as personal definitions of occupational success and career decision-making self-efficacy and has focused primarily on interventions with middle school and high school youth.

Sample research

As explained earlier, one important area of focus in the field of vocational development is the confidence that individuals feel for performing various career-related tasks. Several researchers have explored the ability of various interventions to improve youths' career self-efficacy. Through a series of activities, discussions, and observations of role models, O'Brien and her colleagues were able to raise middle school youths' beliefs that they had the skills nec-

essary to engage in career planning and exploration activities and that they had the academic skills necessary to pursue career paths of interest to them (O'Brien, Dukstein, Jackson, Tomlinson, & Kamatuka, 1999). Turner and Lapan (2005) were also able to successfully improve these same areas of career self-efficacy by utilizing a computer-based program that includes two exploration and career development activities as well as an interpretation and discussion session with a counselor. Kraus and Hughey (1999) targeted career decision-making self-efficacy specifically and found that their eight-session course assisted female students to become more confident.

Along with feeling confident in one's ability to engage in career development tasks, one must also be able to use a range of career exploration activities so as to capitalize upon the exploration opportunities that are presented. Jones, Sheffield, & Joyner (2000) found that, while there is some variation from instrument to instrument, interest inventories can encourage youth to use various approaches to career exploration. Engagement in career planning and exploration activities, active decision making, and pursuing and using occupational information can be successfully fostered by parent–student activities (Palmer & Cochran, 1988). Further, engagement in exploration behaviors is also impacted by the importance one assigns to making a career choice (Jones et al., 2000). Thus, timing of interventions designed to teach exploration behaviors may be important to consider. During times when youth are being asked to make decisions for their future plans (e.g., 8th graders choosing high school courses; high school students planning for post–high school), they may be particularly ready to learn career exploration strategies.

Just as important as the confidence one has for engaging in the process and tasks of career development and the actual career exploration behaviors one uses is the number of occupations one considers. As Gottfredson (1981) asserted, youth narrow the range of occupations that they believe are appropriate for them by a number of variables including gender typing. Thus, for many interventionists and practitioners, the focus of their work is to stall and, it is hoped, reverse this trend of circumscription. Programs of career development (e.g., O'Brien et al., 1999) and even career interest inventories (Jones, 2000) can help youth to increase the number of occupations they consider as possibilities for themselves, as well as the congruence between their personal characteristics (e.g., skills, interests, and abilities) and occupations considered (O'Brien et al.). Further, programs that actively engage youth in identifying and challenging traditional notions of career gender typing encourage both males and females to consider a broader range of nontraditional careers (Turner & Lapan, 2005). Similarly, a four-session curriculum designed to help youth explore and reflect on what they value in life and translate those values into a thoughtful definition of life success assisted youth to define success in broader, more holistic terms that de-emphasized material goods and emphasized enjoyment, satisfaction, and overall quality of life (Mosconi & Emmett, 2003).

Lapan and colleagues (Lapan, Tucker, Kim, & Kosciulek, 2003) investigated the impact that school-to-work partnership programs have on the career development of rural youth. Results indicated that the career guidance curricula used in the school-to-work programs and the level of teacher and counselor support perceived by youth positively impacted youth outcomes such as career-related self-efficacy, engagement in career exploration activities, and work-readiness skills. Youth who experienced improvements in their level of career development were more likely to aspire to continue their education and/or training after high school and were more likely to feel satisfied with the preparation they had received. Perceived support and the guidance curricula also had small, but important effects on both post-high-school plans and satisfaction with preparation (Lapan, Tucker, et al., 2003).

Further, both Schlossberg, Morris, & Lieberman (2001) and Lapan, Gysbers, Hughey, and Arni (1993) explored the impact of classroom-based career interventions on various career development competencies. Specifically, it was found that such programs improved students' knowledge of careers, their abilities to explore and plan for careers, and to make decisions about post-high plans, and to understand how gender relates to jobs and careers (Lapan et al., 1993). Students reported high levels of satisfaction with the intervention. Youth who made progress on the competencies also demonstrated higher postintervention vocational identity scores (Lapan et al., 1993).

Meta-Analyses Related to Career Interventions

Also important to our summary of relevant school-based career intervention research is a review of several important meta-analyses (Brown & Ryan Krane, 2000; Whiston, Sexton, & Lasoff, 1998) of career intervention efficacy conducted over the past 10 years. Both the Whiston, Sexton, and Lasoff and the Brown and Ryan Krane meta-analyses were undertaken to update and expand upon previously published meta-analyses (i.e., Oliver & Spokane, 1988; Spokane & Oliver, 1983). Whiston et al. found an average effect size of .45, indicating that career interventions, in general, demonstrated a moderate level of effectiveness. Stated another way, career interventions produced meaningful and moderately strong improvements in career development. School-based career interventions, too, were found to be effective, especially those at the middle school level. In fact, of all age groups included in this study, middle school students appeared to benefit the most from career

interventions. Intuitively it makes sense that middle school students are a particularly impressionable group. For many youth, middle school (and 8th grade in particular) is the first time that they are asked to make decisions based upon their career interests. They are confronted with the task of needing to choose courses for high school and, thus, to consider what types of courses would best prepare them for potential career paths.

Both meta-analyses also examined the impact of various types of career interventions. While results varied some between the two analyses, they both consistently found that individual and group career counseling activities as well as classroom-based interventions were more powerful than self-directed and counselor-free activities (Brown & Ryan Krane, 2000; Whiston et al.). However, when examined by level of impact of the intervention by cost per individual, classroom-based and computer-based interventions surpassed individual and group counseling activities in their usefulness and their efficiency (Whiston et al., 1998).

The impact of an intervention also varied by the number of sessions included. Specifically, it was found that effect sizes rose steadily across sessions until reaching the 4 to 6 sessions mark (Brown & Ryan Krane, 2000; Whiston et al.), and again at 9 to 10 sessions (Whiston et al.). This is important information for school counselors to have as they are planning their career development curriculum.

Finally, Brown and Ryan Krane (2000) also coded studies not just by intervention type and number, but also by components of interventions. They found that out of 18 possible treatment components, five components were most influential. These included written exercises, individualized interpretations and feedback, world of work information, modeling opportunities, and attention to building support for choices within one's social network. Studies that included one component had average effect sizes of .45 (moderate effect); those with two components had effect sizes of .61; and those with three components had large effect sizes of .99. No studies were found that included 4 or 5 of these components. This information is particularly useful to school counselors and other interventionists as it provides clear guidance as to the types of activities and program elements that should be included in career development curricula.

Practice

Having reviewed traditional theories of career development and contemporary developmental models as well as research on career interventions, it is now time to focus our attention on the practice of culturally responsive career programming for youth. The literature previously reviewed provides guidance as to key aspects of such work. In the remainder of this chapter, we will offer practice recommendations for school counselors and describe two examples of career development programs for youth that were designed to be culturally responsive in nature.

First, the growing diversity in our nation's population makes it clear that multicultural competence is necessary for effective, respectful school counseling practice. Research by Lapan and colleagues (1997) demonstrated that even very effective school counseling programs may not provide opportunities for low-income and diverse youth to experience the same levels of success as their White, middle-class peers. Efforts to create career development programming for culturally diverse and low-income youth must be based upon a solid knowledge of diverse cultural practices and beliefs, models of acculturation and racial identity development, and worldview orientations.

A multicultural perspective is not, however, sufficient on its own. Vera and Speight (2003) have articulated well the need to expand our professional work to include a commitment to promoting a more socially just world. School counselors cannot ignore the serious economic consequences of the achievement gap that impact the life outcomes of this nation's culturally diverse and low-income youth. Embracing a social justice perspective expands the role of school counselor from solely engaging in one-on-one treatment strategies to focusing on creating a school context that promotes youth development academically, interpersonally, and vocationally. Thus, by incorporating a social justice perspective into one's work, school counselors commit themselves to intervening at the system's level within (and perhaps outside of) the school to shape policies and create programs that are designed to support optimal development for all youth.

Furthermore, youth will benefit both immediately and in the long term from opportunities to develop the competence and skills necessary to enter *and succeed in* postsecondary settings, such as 2-year and 4-year colleges. Career interventions should be designed with this purpose in mind. The Secretary's Commission for Achieving Necessary Skills (Resnick & Wirt, 1996; SCANS, 1992) describes the range of skills and dispositions necessary to be effective in transitioning into the world of work. The SCANS report is consistent with the *ASCA National Model* (ASCA, 2003), which identifies the role of school counselors as promoting development in three domains: (a) academic, (b) interpersonal, and (c) career. SCANS clearly articulates that one's ability to transition into the world of work is predicated upon an integration of all three of these areas. According to this report, in order for youth to make effective work transitions, they must possess basic literacy and numeracy skills, be able to think critically, and possess personal qualities such as honesty and integrity. In addition to the basic skills, a number of competencies were also outlined

in the SCANS report. These competencies include managing time effectively, interpersonal skills, the ability to gather and use information, understanding the relatedness of various systems, and use of technology (Figure 19.7). It is recommended that educators and interventionists who work with youth from culturally diverse and lower income backgrounds should create career interventions that integrate the academic and interpersonal domains. The focus of intervention efforts should be on helping develop competent learners who understand how to navigate the world of work and possess the skills needed to make effective school-to-work-to-life transitions (V. S. Solberg, Howard, et al., 2002).

Next, academic, career, and life success is supported by a number of internal and external protective factors described in the resilience and developmental assets literature. Professionals can create interventions that help youth develop internal and interpersonal assets, such as academic self-efficacy, internalized motivation, stress and health management skills, and relational connections with family members, teachers, and peers. Further, they can work at the school level to create programs and policies that offer opportunities for youth empowerment, provide supportive relationships, and allow youth a range of creative, enriching extracurricular options.

Finally, research indicates that the effectiveness of career interventions will be stronger when they are conducted in classroom or group settings (Whiston et al., 1998). Brown and Ryan Krane (2000) further espoused that career interventions will be more effective when the classroom or group methods incorporate a number of key ingredients, which include the following: written exercises, individualized interpretations and feedback, world-of-work information, modeling opportunities, and attention to building support for choices within one's social network. Theory and research also suggest additional ingredients that should be considered. From social cognitive theory (Bandura, 1986), adding mastery, vicarious, and anxiety management experiences will increase youth's confidence for performing the tasks outlined in the intervention. From self-determination theory (Deci & Ryan, 1985), interventions that incorporate activities designed to establish stronger relational connections between youth and their teachers and peers will result in youth engaging in the career activities because they find them enjoyable and meaningful (Figure 19.8).

Sample Programs

We will now turn our attention to two examples of culturally responsive career intervention programs that were derived from research and theory: the Career Horizons (O'Brien et al., 1999) and the Achieving Success Identity Pathways (V. S. Solberg, Close, & Metz, 2002; V. A. Solberg et al., 1998) programs.

Necessary Skills and Competencies (based on SCANS, 1992)

Basic Skills
Reading, writing, arithmetic, listening, and speaking

Thinking Skills
Creative thinking, decision-making, problem-solving, visualization, knowing how to learn, and reasoning

Personal Qualities
Responsibility, self-esteem, sociability, self-management, integrity/honesty

Competency Areas
Resources
Time management, money management, material and facilities, able to evaluate others

Interpersonal
Participates as member of a team, teaches skills to others, serves customer, exercises leadership, negotiates, and works well with diverse populations

Information
Acquires, evaluates, organizes, interprets information

Systems
Understands systems, monitors and corrects performance, improves based on feedback

Technology
Selects technology, applies technology to tasks, can problem-solve technology related issues

Figure 19.7 Secretary's Commission for Achieving Necessary Skills.

Effective Career Curriculum Ingredients
Written exercises[1]
Individualized interpretations and feedback[1]
World-of-work information[1]
Modeling/vicarious opportunities[1, 2]
Building support networks[1]
Mastery experiences[2]
Verbal persuasion[2]
Anxiety management[2]
Building social connections between youth, adults and peers[3]

Figure 19.8 Effective career curriculum ingredients. [1]Brown & Ryan Krane, 2000; [2]Bandura, 1996; [3]Deci & Ryan, 1986.

Career Horizons

The Career Horizons program was designed to increase career readiness skills among middle school youth from culturally diverse and lower income backgrounds (O'Brien et al., 1999). This summer transition program targeted youth who were deemed by their sixth-grade teachers as at risk for academic difficulties. Career Horizons was designed to increase student's confidence to explore and plan for careers, increase self-knowledge, improve student's perceived relevance with regard to the importance of math and science, and increase the range of career interests. A series of 20 classroom-based sessions were provided to youth (details of the curriculum may be obtained by contacting Karen O'Brien). Throughout the intervention, the curricula incorporated exploration activities designed to increase youths' self-efficacy for performing the specific tasks. For example, in a class devoted to increasing math and science interests, role models not only discussed the range of career options related to their area of math and science and the importance of math and science in relation to many career options, but also supervised an activity in which youth performed hands-on experiments. O'Brien et al. used measures drawn from the Missouri Comprehensive Guidance Evaluation Survey (Gysbers, Lapan, Multon, & Lukin, 1992) to evaluate whether exposure to the program was associated with increased career search self-efficacy. They reported significant differences between pre- and posttest scores such that students exposed to Career Horizons reported more confidence in being able to engage in career planning and career exploration, more awareness regarding the relevance of math and science to academic and career interests, and an increased number of career options.

Career Horizons attempts to increase youth's career readiness competence as a method for helping at-risk youth from culturally diverse and low-income backgrounds make more effective transitions into middle school. This program clearly incorporates a number of the practice strategies related to social justice. As part of its design, Career Horizons includes at least 11 of the developmental assets identified by the Search Institute as being related to competence. With regard to external assets, the program offers adult role models, promotes positive peer influences, maintains high expectations, and offers creative activities. With regard to internal assets, the program helps youth engage in planning and decision making; fosters school engagement, achievement motivation, and bonding to school; and encourages the development of a sense of personal power and purpose as well as a positive view of one's future. With regard to the design of the curriculum, Career Horizons incorporated a number of processes identified by Brown and Ryan Krane (2000) as well as related research and theory as being influential in promoting youth competence. Specifically, the program offers mastery and vicarious experiences whereby youth are able to learn by doing and watching others perform various tasks. Youth received knowledge about the world of work, engaged in written exercises, and received individualized assessment information. Youth were also engaged in social support activities.

Achieving Success Identity Pathways

The Achieving Success Identity Pathways (ASIP; formally titled the Academic Success Identity Plan) is a curriculum school counselors can use to challenge all students to improve academically (V. A. Solberg et al.; V. S. Solberg, Close, & Metz, 2002, 1998). The goal of the program is to help youth build "success identities" and the skills needed to make effective school to work-to-life transitions. The curriculum is implemented in classroom settings and consists of the ASIP Navigator, Hear My Story, and Action Theater. The ASIP Navigator provides youth with individualized feedback about how they perceive their academic self-efficacy, motivation, health, stress, and social support. Through classroom conversations about these topics, youth are provided the opportunity to share their life experiences, discuss career goals, and listen as the school counselor, teachers, and peers discuss their experiences as well. Youth complete a workbook that helps them articulate their challenges and develop self-determined plans of action. Hear My Story encourages youth, the school counselor, and their teacher to write about their lives according to any number of strategies including poetry and autobiographical short stories and then share their writings with the class. Action Theater uses sculpting exercises, short plays, and live improvisational techniques to help youth learn the nature of how problem and success behaviors evolve during their daily experiences, Close, & Metz.

The ASIP program was derived from theory and research (Solber, Closer, & Metz, 2002) in academic self-efficacy (e.g., Zimmerman, 1995; Zimmerman, Bandura, &

Martinez-Ponz, 1992), vocational self-efficacy (e.g., Betz & Hackett, 1981; Lent, Brown, & Hackett, 1994), motivation (e.g., Deci & Ryan, 1985), and social support (e.g., Wentzel, 1998; Wickrama, Lorenz, & Conger, 1997), as well as best practices in vocational education (e.g., Brown & Ryan Krane, 2000) and group theory (e.g., Yalom, 1995). ASIP was piloted in an urban high school that serves lower income youth of predominately Latino background. The student population consisted of about 65% Latino youth and about half of these youth were classified as English language learners. African American youth compose the second largest ethnic group (20%) and 90% of the youth receive free or reduced lunch. Due to the large number of Spanish-speaking youth and low entering-reading levels, the curriculum has been translated into Spanish and is written in both English and Spanish for a fourth-grade reading level. Evaluations of the program's effectiveness indicate that youth who were exposed to three or more classroom experiences using the ASIP curricula recorded better grades, more credits earned, and higher end-of-semester attendance (V. S. Solberg, 2001, 2005). Grade improvements were found to continue 2 years following intervention (V. S. Solberg, Carlstrom, & Kowalchuk, 2001). More importantly, the program has been credited with helping to transform a low-performing school by helping students establish stronger relationships with teachers and peers and helping teachers establish a clearer understanding of the challenges facing their lower income students.

ASIP attempts to increase youth's competence to make effective transitions into high school. The program incorporates a number of the practice strategies related to social justice. Throughout the curriculum, students are encouraged to define for themselves the challenges they experience and to express their personal stories in their own terms through conversation, written exercises, and theater. ASIP incorporates at least 21 of the developmental assets identified by the Search Institute as being related to competence. With regard to external assets, the program encourages family support, positive family communication, relationships with adults, a caring school climate, and a community that values youth; it views youth as a resource, addresses safety in school and the community, reinforces school boundaries and clear consequences, provides adult role models, encourages positive peer influences, holds high expectations, and offers creative activities. With regard to internal assets, the program encourages planning and decision making, school engagement, achievement motivation, bonding to school, equality and social justice, interpersonal competence, cultural competence, personal power, sense of purpose, and positive view of one's future. With regard to the design of the curriculum, ASIP also incorporates a number of key ingredients identified by Brown and Ryan Krane (2000) as well as related research and theory as being influential in promoting youth competence. Specifically, the program offers mastery and vicarious experiences whereby youth are able to learn by doing and watching others perform various tasks. Youth receive knowledge about the world of work, engage in written exercises, and receive individualized assessment information. Youth also receive opportunities for establishing stronger connections with teachers and peers.

Conclusion

As our nation's population continues to grow more diverse, school counselors will increasingly be challenged to create and provide culturally responsive comprehensive school counseling programs. By focusing on the provision of services that offer opportunities for all youth to realize their academic, career, and personal potential, school counselors are promoting a more socially just society for the youth with whom they work. Culturally responsive career development programming will rest on a base of cultural knowledge and competence, will incorporate a commitment to social justice, and will provide opportunities for youth to develop the academic and transitioning skills needed to pursue and excel in their postsecondary plans. Further, it will promote the development of the resilience characteristics and internal assets that support positive outcomes for youth and will incorporate a range of external assets and protective factors as well. Finally, culturally appropriate career programming will be informed by research and theory of "best practices," and will include aspects of interventions that have been found to contribute to positive career development outcomes.

School Counselor Competence

XX
SCHOOL COUNSELOR TRAINING: School and Societal Needs in the 21st Century

JOHN L. ROMANO, KAY HERTING WAHL, AND JULIE M. KOCH
University of Minnesota–Twin Cities

Introduction

The evolution of the education and training of school counselors has progressed as the role of the school counselor, the profession of school counseling, and the educational enterprise have changed over the years. This chapter will give a brief historical review of school counselor training and practice during the past 100 years, commenting on the development of the profession and highlighting the major training developments during this period. The major objective of the chapter is to examine the theoretical and curricular frameworks of more recent school counselor training initiatives, including empirical evidence related to the impact of the educational programs that train school counselors. In conclusion, the chapter will suggest recommendations for the training of school counselors to maximize the effectiveness and impact of school counselors in the 21st century.

The history of school counseling can be traced back to the early part of the 20th century as the United States was experiencing major societal changes as a result of the influx of new immigrants to the country and urbanization (Baker & Gerler, 2004). School counseling, which generally focused on vocational guidance activities, was undertaken by personnel in the schools with no formal training in counseling. In succeeding years, school counseling was influenced by different societal and professional developments, including the standardized testing movement of World Wars I and II, protection of children through child labor laws, the vocational guidance centers of Frank Parsons, and the mental health movement. In addition, theoretical concepts of Carl Rogers and his nondirective theory of counseling greatly influenced the profession. In the 1950s, school counseling reached a level of professional recognition through the formation of the American School Counseling Association (ASCA) and the National Defense Education Act (NDEA), which provided federal funding to staff schools with counselors and to train school counselors at universities throughout the country. During this period, the training of school counselors and their roles in schools were not clearly defined (Baker & Gerler, 2004). Training programs, as well as school counselor positions, were usually open only to those with a classroom teacher's license or certificate, and the training programs tended to be offered during the summer months and part-time during the academic year, to accommodate licensed teachers.

During the decades of the later 20th century, the training of school counselors became more defined. Different training models were initiated, including the Comprehensive School Guidance Model (Gysbers & Henderson, 1988) and the Developmental Model as proposed by Myrick (1987). The models emphasized a comprehensive K–12 approach to school guidance and counseling, and recommended that school counselors focus on the career, educational, personal, and social development of students. These models made major contributions to the training and practice of school counselors compared with earlier years. In recent years, however, educational leaders both within and outside of the field of school counseling were concerned about the lack of influence and impact of school counselors (Stone & Dahir, 2006). In addition, concerns about the adequacy of the training of school counselors have been raised (Schmidt, 2003). Among the concerns are the lack of understanding of new school counselor professionals

about the changing dynamics of schools and the students they serve (Sears & Granello, 2002). As a result, two initiatives were developed. One, called the *Transforming School Counseling Initiative* (TSCI), focused on the graduate-level training of school counselors, and the other, the *ASCA National Model*, focused on the practice of school counselors in the field. These models of training and practice will be described more fully below.

While the school counseling profession continues to develop the best possible training models and delivery of services in the schools, the academic and mental health needs of children and adolescents are issues of concern to school stakeholders. These stakeholders include educational policy makers, teachers and administrators, parents, community leaders, and students. The No Child Left Behind federal legislation focused on student academic achievement and high-stakes testing programs throughout the country. Academic disparities across the educational landscape showed large achievement differences between students from lower socioeconomic communities and students from some ethnic communities compared with Caucasian students and those from more affluent communities. Sometimes referred to as the "achievement gap," data show that while some progress has been made in reducing the achievement gap, there are still systemic differences between students from different socioeconomic and ethnic groups (Perie, Grigg, & Donohue, 2005).

In addition to academic achievement indicators, children and adolescents have needs for mental health services, and schools provide a large proportion of these services (Rones & Hoagwood, 2000). A recent study by the U.S. Department of Health and Human Services addressed the country's school mental health services (Foster et al., 2005). One of the major findings of the study was that 20% of students received some type of school-supported mental health service. The most frequent mental health concerns for males and females were social, interpersonal, and family problems. The second and third most cited concerns for female students were anxiety and adjustment problems, while aggression and behavioral problems were most frequent for males. School districts reported that while the need for student mental health services has increased since 2000, funding for such services has decreased. School counselors were the most frequently identified mental health professional in the school. Given the high demand for services, many districts were attempting to meet the student mental health needs through community-based providers. Among the recommendations of the study was the need for additional school-based research that specifically examines the type and number of student problems presented, and the most effective combination of services, given the skills and training of school personnel who are assigned to deliver them and the availability of community resources for referral. The study did not collect data about the training and professional development needs of school personnel to adequately meet student mental health needs, nor did the study examine job responsibilities and school administrative structures that may reduce the effectiveness of school personnel (e.g., high school counselor-to-student ratios and administrative duties).

The profession is at a critical time in the training of school counselors for several reasons. Despite a recent history that includes well-articulated statements about purpose and roles of professionals in the field, the school counselor role continues to be met with ambiguity within many school systems. In some school districts and universities, there is a major discrepancy between the role of the school counselor and the preservice school counselor training that counselors receive. Too many school counselors are spending too much of their time on quasi-administrative tasks and too little time directly serving students in ways that are compatible with their training (Baker & Gerler, 2004; Burnham & Jackson, 2000; Partin, 1993). The ASCA model hopes to correct this, by recommending that school counselors spend 80% of their time in direct service to students (ASCA, 2003). School counselors may believe that they are adequately trained to deliver direct service given their graduate level curriculum; however, traditional training programs may not prepare students in areas necessary to be effective in new roles required of school counselors, such as providing schoolwide leadership to facilitate systemic school change. This latter criticism of school counselor preservice training was the impetus for the *Transforming School Counseling Initiative*. For change to occur in both school counselor preservice training and school counseling practice, major coordination between universities that train school counselors and school districts that hire counselors is needed. However, other aspects of school counselor preservice training are important, and this chapter will examine the training of school counselors and recommend ways to strengthen the training.

Theoretical Bases and Models of Training

School counselor training programs have undergone a metamorphosis in theoretical bases from the inception of school counseling to the present. The earliest training program models were created with the idea of training school counselors to help students prepare for successful vocations after high school. This model of training included preparing high school students for a future career and successful adjustment into adult society (Thompson, 2002).

These training programs primarily focused on vocational development theory.

Compulsory education laws in the 1920s, along with industrialization, urbanization, and immigration, placed new demands on schools for providing more than academic instruction. A sharp increase in numbers of students unsure about school attendance as well as their futures (Baker, 2000) created a need for changes in education to help bridge the gap between school and the adult world and the transition from school to work. School counselors began to answer those needs as school counselor training models focused on psychological adjustment as well as vocational guidance (Erford, 2003). School counselors needed to be trained to assist high school students with social skills for successful and independent living after high school (Baker & Gerler, 2004). In addition, psychometrics became a component of school counselor training after World War I (Sciarra, 2004). Schools were the ideal setting to utilize a variety of psychological measures to help students with vocational and life planning, as well as adjustment issues (Erford).

Gradually, more sophisticated models to train school counselors evolved; however, many training programs developed from the theoretical bases of counselor educators, who were not necessarily focused or experienced in public schools and the practice of school counseling, leaving the profession without a unified direction or theory of training.

In 1958, the U.S. government, through the NDEA, provided funding for school counselors to help high school students choose courses that would promote knowledge and interest in science and math as well as careers in these fields (Baker, 2000). As a result, school counselor training programs were quickly developed, with little theoretical direction other than the dictated purpose of the NDEA. Training programs were inconsistent in their theoretical models related to training curricula, skills, and requirements.

The mental health components of school counselor training programs evolved with the popularity of psychological counseling theorists such as Carl Rogers and his Person-Centered Theory. Humanistic theories influenced the training and practice of school counselors in the 1950s and remained a strong influence in the following decades (Baker & Gerler, 2004). The mental health theoretical approach to school counselor training seemed to be the answer to criticisms that the mental health needs of children and adolescents should be met in their natural environments, including the schools (Erford, 2003). Generic counselor training programs educated school counselors in foundational counseling theory and techniques, and required other courses specific to school counseling. This practice of course integration across the curriculum continues in the majority of school counselor training programs today. The unfortunate circumstance of this practice is that there is little or no connection between information imparted in the counseling foundation courses and those more specific to the role of school counselors (Martin, 2002).

ASCA, founded in 1958 as a division of the American Personnel and Guidance Association (now called the American Counseling Association, began to bring unification and standards to the field of school counseling (Cobia & Henderson, 2003). A major revolution in school counselor training models came with the advent of the comprehensive guidance model developed by Dr. Norman Gysbers at the University of Missouri and later refined by Gybers and Henderson (2000), which has become the basis for almost all current school counselor training models. This model focused on preparing school counselors to serve all K–12 students in the schools and was comprehensive in terms of addressing the career, academic, and social development needs of students (Sink, 2005).

Training programs across the country began to adopt the comprehensive model for training school counselors, but these programs also adapted the model to meet the needs of schools in their own states (Sink, 2005). The comprehensive model called for school counselors to develop prevention and intervention programs at all levels in the schools and to work with students individually, in groups, and in classrooms. The comprehensive model organized programs into three major areas called domains—personal/social, academic, and career development—assuming that these areas encompassed the needs of all students. The comprehensive model detailed activities and duties into components assigned to each domain. The components consisted of individual planning, system support, classroom guidance, and responsive services. Gysbers and Henderson (2000) specified amounts of time that counselors should spend in these components at the different levels of education, realizing that student needs at elementary schools were different from those in middle and high schools. The comprehensive model also called for K–12 programming on all topics. For example, the model asserted that career education must start at the kindergarten level and continue in each grade level until graduation. The comprehensive model provided well-defined structure, procedures, and system for school counselors to organize their programs and time. The comprehensive guidance model was considered a template from which other models of training and practice could be formed to meet local needs (Thompson, 2002).

In 1987, Myrick proposed the Developmental Theory for school counselors in his publication, *Developmental Guidance and Counseling: A Practical Approach*. Myrick's theory added the aspect of awareness and developmental stages to Gysbers and Henderson's (2000) comprehensive

model. According to Myrick, the development of children throughout their growth stages must be an integral part of the planning of all work with children. The physical, emotional, cognitive, and psychological development of children must be recognized as school counselors work to help all students be successful throughout childhood and adolescence. Developmental guidance stressed cooperation between school counselors and school staff, particularly teachers. It stated that setting goals and determining curriculum and programs must be established with developmental stages in mind.

In practice, the comprehensive and developmental models were often combined in school counselor training programs and in school counseling literature. While school counselors continued to be trained in generic counseling programs, comprehensive and developmental guidance perspectives became the unifying theme of school counselor training curricula within counselor training programs in the 1980s and 1990s (Thompson, 2002).

In the 1980s, federal funding and a new emphasis on the future of high school students advanced a practical concept called "school-to-work" (Erford, 2003; Worthington & Juntunen, 1997). This renewed emphasis on vocational guidance, or "career development" as it is now called, was added to school counselor comprehensive training programs (Baker & Gerler, 2004). In the same decade, the mental health movement in U.S. society in general, and more specifically, in the school counseling field, added a renewed emphasis on the mental health of school children (Schmidt, 2003). As theories of psychotherapy gained greater emphasis in society at large, they also emerged as counseling models for school counselors, such as Solution Focused Brief Theory (Rye & Sparks, 1999), Rational Emotive Behavior Therapy (REBT; Ellis, 1994), and Choice Theory (Glasser, 1998). Counseling theories were usually taught as part of counselor training programs, and the application of the theories to school counseling was expected to be taught in the school counseling specialty courses within the training program. School counselor specialty courses were now focusing on counseling skills to serve all students, prevention and intervention programs for all students, and the need to address mental health as well as career issues for all students. School counselor training also included the expanded role and function of the school counselor as defined by comprehensive and developmental guidance programs, including the 3 C's: counseling, coordinating, and consulting (Erford, 2003).

Although the comprehensive and developmental guidance and school counseling training models have been the cornerstone in school counseling programs throughout the 1990s, many individualized and unique models have developed in recent years. The common thread among new training initiatives remains the comprehensive and developmental approach to school counseling. A few of the newer models are summarized in the following paragraphs.

The Support System Approach was proposed by Rye and Sparks (1999). This is a consumer-centered program, with a community-based decision-making foundation. This approach has a new focus on consumer participation, but is also meant to be delivered in a comprehensive and developmental school counselor model, thereby allowing training programs to maintain their adherence to the comprehensive developmental model while adding a consumer or community-based aspect. The Support System Approach to training includes the school counselor, the entire school staff, and the community. In this approach, values and beliefs known and understood by the community and the school are developed into goals for the school and for the school counseling program. The uniqueness of the model lies in preparing graduates to work with a school staff, including teachers and administrators, and with the community. School counselors are trained to develop and share a vision and a mission with constituents from all areas. A major goal of the program is to strengthen the bond among the school, the school counseling program, and the community through collaboration.

The School-Community Collaboration Model (Adelman & Taylor, 2002) is a similar approach to the Support System Approach. The School-Community Collaboration Model includes the creation and maintenance of collaborative connections with public and private agencies, higher education, business and professional organizations, churches, and volunteer organizations. School counselors are trained to begin with local and neighborhood levels of collaboration and eventually expand to broader based connections.

In the 1990s, the *Transforming School Counseling Initiative* (TSCI), supported by the Wallace Reader's Digest Fund and managed by the Educational Trust National Center for Transforming School Counseling, developed a model to transform the training of school counselors. Advocates believed that the training of school counselors had to change to strengthen their impact in the schools. A major goal of TSCI is to train school counselors to have a significant impact on students by helping to close the achievement gap between different groups of student (Seashore, Jones, & Seppanen, 2001). To accomplish this goal, according to TSCI, school counselors must be trained to reduce barriers to academic achievement and become advocates for equity in all aspects of education. School counselor training includes learning about schools and their cultures, advocacy skills to promote important school changes, skills to increase collaborative activities with other school personnel and the community, and the use of data and technology for informed decision making. Other goals of TSCI are the inclusion of the school counselor as a member of the school leadership team, the focus on systemic change for

the betterment of all students, and partnerships with community agencies. An extremely important practice within the goals of the TSCI is the linkage of the school counselor training program to indicators of student success, such as improved attendance, behavior, test scores, and graduation rates. The linkage to student academic success lends itself to further research on the relationship between student mental health and academic success. Therefore, future research will help to inform training programs about the importance of the inclusion of mental health training in all school counselor programs.

The TSCI model supported the call for school counselors to take a more active leadership role in schools (Erford, House, & Martin, 2003). Educators at all levels seemed to agree that school counselors could effect change for all students, especially in closing the achievement gap and increasing the academic success of all students. This goal seemed to alter somewhat the comprehensive and developmental training models of some programs, but the goal did not eliminate the earlier conceptual training models from school counselor training. Since the TSCI model is relatively new, research on its implementation and effectiveness is limited; however, the model is given further attention in the research section of this chapter.

The *ASCA National Model: A Framework for School Counseling Programs* incorporates the ASCA National Standards for School Counseling Programs (Baker & Gerler, 2004) and has been adopted by ASCA as the national model for school counselor practice *(*ASCA, 2003). A major goal of the ASCA model is to develop comprehensive school counseling practice models that are integral to high student academic achievement across the school population. In this regard, the National ASCA model complements the transformation of school counselor training supported by TSCI.

The ASCA Model highlights the National Standards for School Counselors and reflects current educational trends, including the No Child Left Behind legislation. Therefore, school counseling programs must meet the needs of all students and include components such as a districtwide delivery system that includes a guidance curriculum, individual student planning, responsive services, and system support. In addition, the model requires a management system that is based on student needs, is data-driven, offers services for academically underperforming students, and infuses strategies for systemic change, leadership development, and advocacy throughout all components of the program.

Gysbers and Henderson (2002) reported that the *ASCA National Model* consists of three elements: (a) content, (b) organizational framework, and (c) resources. *Content* is defined as the curriculum through which K–12 students achieve developmental competencies. The organizational framework consists of delivery modes and the K–12 scope of guidance activities. Delivery modes include classroom guidance, schoolwide counseling activities, and individual student planning. Student planning requires that the counselor be competent in student appraisal techniques, student advising, and career and personal/social counseling skills. The ASCA model also stresses the importance of regular program evaluation, planning, and management; continuing professional development for counselors; maintaining communication and relationships with important stakeholders (e.g., parents, community leaders, school administrators, and teachers); school counselor service on advisory boards; and community outreach. School counselors are encouraged to advocate for students and schools in the political process through their state legislators and local school boards. Again, these are goals that are addressed in the TSCI training model.

The ASCA model incorporates the comprehensive development model of training, as well as the more recent models. The newer training models require that prospective school counselors be trained in leadership and counseling skills. This is a paradigm shift from the focus on individual and group counseling and comprehensive programming to the facilitation of school-based systemic change. It must be noted that the ASCA model does not deemphasize the comprehensive and mental health models of school counseling practices. Instead, the ASCA model incorporates previous models into a more integrated model. To summarize, in the ASCA model, the counselor's role is as an advocate for all students, supporting and strengthening their academic, career, and emotional and social needs, while delivering a comprehensive program with a focus on systemic change.

The ASCA and TSCI models create a new vision for the school counselor role. Traditional practices must be enhanced to include, emphasize, and utilize the collaboration and leadership skills of school counselors. A major function of the new school counselor role is to be an agent of systemic change, with the academic success of all students as a major goal. To reach this goal, school counselors need training in accountability and evaluation strategies, public relations and marketing skills, and presentation skills. With little training or perceived need for accountability and evaluation skills in the past, school counselors are now being called on to discuss the efficacy of their programs to school boards and community groups and to deliver the presentations using PowerPoint and other technology-enhanced strategies. These types of activities are necessary to help stakeholders understand the role of the school counselor; to communicate the impact of school counseling on the academic, career, personal, and social development of students; and to support the need for school counseling funding for prevention and intervention programs. School counselor training programs must

ensure that students graduate with evaluation and presentation skills.

The change in school counselor practices also requires a change in training. Currently, the majority of school counselor training programs, whether they are accredited by the Council for Accreditation of Counseling and Related Educational Programs (CACREP) or by regional or state agencies, require a master's degree in counseling. A typical program usually includes training in individual and group counseling theory, application, and skills; career development and multicultural counseling; and foundational courses in psychology, statistics, and research methods. School counseling specialty courses also usually include development and planning of comprehensive school counseling programs, prevention and intervention program development, and crisis intervention and consulting skills (Thompson, 2002). In order for school counseling students to attain the skills needed in newer school counseling delivery models, training curricula must include skills in leadership, creative planning, public relations and marketing, program accountability, public speaking, and community relations. Current trends in public schools and school counselor training models require that the practicing school counselor be trained and skilled in much more than traditional individual and group counseling—sometimes referred to as a "mental health focus" or "therapy focus"—if the position of the school counselor is to remain a vital and integral part of education.

A major dilemma facing the school counseling profession is that students usually choose the profession because they wish to engage in personal counseling with children and adolescents to help them solve problems. Historically, school counselors desired to be change agents for students, but not necessarily for schools or school districts. Taking on a leadership role may not be the career they intended nor the career for which they feel best suited. School counselors already in the field may be satisfied with the comfortable status quo, while new school counselors in training may be resistant to the leadership aspect of their school counseling roles. Therefore, school counselor training programs, through marketing and recruitment of new students, must articulate newer models of training and roles so that appropriate students are attracted and admitted to the training program.

Another dilemma for training programs is that additional theoretical and skills courses will be needed to complement existing training programs, and current faculty may not have the interest or qualifications to teach the courses. Further, most training programs may find it difficult to add new courses and content areas to an already full, two-year master's degree counseling program. Therefore, training programs will need to find innovative ways to give students the necessary training and skills, perhaps through focused assignments in existing classes and through small group course modules for school counseling students.

Another training area that needs attention is the need to infuse information about the role of the school counselor in the education of school administrators (Martin, 2002). Without school administrators' cooperation and awareness of the new trends in school counselor training and practice, the new school counseling initiatives may well be met with resistance in the schools. Change has generally been constant but slow in education; thus, the changes suggested for school counselors in the new models will require cooperation and coordination among school and community stakeholders, and especially among school administrators.

Field Experiences

At present, the only current, standardized guidelines for school counseling fieldwork training experiences are those accredited by CACREP. While state departments of education may require field experiences, they are not standardized. The 2001 CACREP standards give guidelines for instructor, student, and site supervisor qualifications. In addition, the standards state that the "clinical instruction environment . . . is conducive to modeling, demonstration, and training and . . . ensures adequate and appropriate access by the faculty and students" (2001, Section III.D., p. 11). The CACREP standards offer explicit requirements regarding physical necessities of the learning environment, such as access to technology. In addition, CACREP requires that students complete a 100-hour supervised practicum experience and a 600-hour supervised internship, both of which require a specific number of direct service hours, individual supervision, group supervision, and evaluation of the graduate student. In addition, the CACREP standards state that clinical experiences should provide the opportunity for students to gain experience interacting as counselors with students who represent "the ethnic and demographic diversity of their community" (Section III.K. p. 13). The CACREP standards emphasize that "practicum and internship requirements are considered to be the most critical experience elements in the program" (Section III, p. 11).

There are a few concerns, however, regarding the CACREP standards. First, currently, 188 counselor training programs are CACREP accredited, but there are also training programs that are not CACREP accredited. Research does not indicate how many of the nonaccredited programs follow the CACREP standards. Some professionals have criticized CACREP for not providing enough structure. One concern, for example, is that the fieldwork experience and site supervision is an individual training program deci-

sion (Bradley & Fiorini, 1999). On the other hand, others fear that CACREP is overly rigid and restrictive, allowing for no flexibility in its requirements. A recent major concern expressed by some is CACREP's insufficient attention to multicultural and social justice issues (M. D'Andrea, personal communication, 2005). This concern is particularly worrisome due to the importance of school counselors' being trained and experienced in working with multicultural populations in schools. Therefore, while CACREP is the only national body to accredit school counseling programs, some institutions may choose not to seek accreditation, but, as an alternative, to ensure that their programs meet state license guidelines.

Perusse, Goodnough, and Noel (2001) surveyed school counselor training programs to assess the consistency of training program requirements. Among their findings was that the fieldwork component was "one of the greatest areas of difference among programs" (p. 257). They found that over half of the training programs provided some sort of prepracticum field experience in a school setting, such as classroom observation, shadowing, and interviews. While almost all (96%) programs required a practicum experience, they ranged widely from a total requirement of 20 to 700 hours, and only 68% required these experiences to be in school settings. Most (86%) programs also required an internship, and again, they ranged from a total requirement of 100 to 1,500 hours. Some programs based the hour requirement on the students' prior teaching experience.

Perusse et al.'s (2001) findings confirmed Stickel's (1995) results from a similar survey. Stickel found that while counselor educators viewed the field placement experience as "very positive" (p. 9), expectations for activities that students engage in during their practicum or internship were inconsistent. For example, school counselor trainees may find that their duties include "activities considered noncounseling such as discipline, general staff duties, and clerical duties" (p. 9). One respondent wrote, "Many counselors are locked in to doing administrative, noncounseling work. Tradition is strong; change is slow" (p. 9). Stickel also found that programs emphasized individual counseling more than group work and consultation, which are considered important components of school counseling programs.

Bradley and Fiorini (1999) surveyed CACREP accredited programs' fieldwork requirements. They first looked at prerequisite coursework and training for enrollment in the practicum course, and they found that over half of the surveyed programs required theory, professional orientation, and human development courses. The least common courses required prior to practicum were appraisal, career, multicultural, and research. Bradley and Fiorini looked at how students were evaluated, and they found that most (63%) programs used letter grades rather than a credit/no credit grade (30%). They found that most programs relied heavily on self-report measures such as student case presentations (83%), but also considered site supervisor feedback (96%) for student evaluation. Regarding counselor competencies, they found that most programs felt that attending skills and self-awareness were important. The researchers were surprised at some of their findings, including that while most programs said that they incorporated multicultural counseling into practicum course content, only 33% of the programs required a multicultural course prior to practicum. Bradley and Fiorini were also surprised that only 60% of the programs stated they expected students to be able to facilitate a counseling group and that it is not adequate to rely on microcounseling skills as the only measure of counseling competency.

In terms of field placements, the TSCI model includes some components to strengthen the fieldwork experience. First, all practicum and internship experiences are required to be in school settings, and fieldwork experiences are developed in collaboration with the university training program, the local school district, and local community agencies. Beginning in the first semester, students are expected to have some field experience in the schools. These experiences can be in the form of shadowing school counselors, observing their work, or participating in different school activities (e.g., after-school tutoring programs). During practicum and internship, students are expected to engage in individual and group counseling, classroom guidance activities, outreach to community groups, and opportunities to participate in evaluation and research studies and to be a member of the school team that includes administrators, teachers, parents, and community members. The TSCI model emphasizes the importance of qualified supervisors who are knowledgeable and support the TSCI goals. One way that the TSCI model achieves this is by recruiting TSCI alumni to serve as site supervisors. However, if TSCI alumni are not available, site supervisors "for whom TSCI goals resonate and who have strong school counseling programs" are recruited as practicum and internship supervisors (Michlin & Meath, 2005, p. 23). Incentives for the site supervisors might include monetary remuneration or the opportunity for continuing education training at the university. Since the quality of site supervision is emphasized in TSCI, supervisors may receive supervision training and continuing education credits. A supervisor's manual is often provided for supervisors with targeted skills, steps toward skill acquisition, and methods of student evaluation. A developmental model of supervision that matches field experiences to the needs of the graduate student is used. University program faculty are actively involved in the field experience and supervision, thereby avoiding the need to rely exclusively on student self-report and supervi-

sor feedback. The field experience is periodically evaluated and reviewed (Michlin & Meath, 2005).

Improved collaboration among school districts, communities, and university training programs is likely to increase the quality of field placements throughout the students' training and strengthen the role of site supervisors. Students are likely to be assigned more meaningful experiences in their field placements, and are likely to participate in activities that are reflective of the new school counseling models. Site supervisors will have a closer affiliation with the training program, and communication between the school and university will be improved.

Research

Unfortunately, there is little to report in the area of research related to the impact on students and schools of different school counseling training models or programs. In looking for research in this area, a number of search engines were used, such as PsycInfo and ERIC. Any articles that hinted at being related to research in this area were perused, as were their references. Faculty who appeared to do research of this nature were contacted. Finally, specific Web sites such as those of the Center for Applied Research and Educational Improvement (University of Minnesota–Twin Cities), TSCI, universities that participated in TSCI, and the Center for School Counseling Outcome Research (University of Massachusetts–Amherst), were investigated. There is a wide range of highly specialized, unreplicated research in areas such as the effect of training school counselors in a unique play therapy technique (Kagan, 2003); the training of school counselors in working with exceptional children (McEachern, 2003); and the training of school counselors to conduct family therapy (Hinkle, 1997). Most of this research is based on in-service training of practicing school counselors rather than preservice school counselor students. The only large-scale research project that has been completed on the training of school counselors has been conducted as an evaluation of the TSCI project (Seashore et al., 2001). Although there might be some concerns with the ability to generalize from this research project because the TSCI emphasized urban, highly diverse populations, nevertheless, it was hoped that the TSCI evaluation would produce empirical evidence that TSCI training is more beneficial than other training models are on school achievement and the lives of students. The TSCI evaluation research did not, however, specifically investigate school counselor trainee outcomes, K–12 student outcomes, or the impact of TSCI-trained school counselors on schools. The 2000 TSCI *Executive Summary* (CAREI, 2000) focuses mainly on the challenges in implementation of the TSCI training model. The final TSCI report (Michlin & Meath, 2005) emphasizes the actual implementation of the training programs and does not address the impact of the training on students or schools. Therefore, the profession is left with unanswered questions about the best school counselor training model to improve student academic achievement and overall student well-being, and about which components of any given training model will best meet the needs of school aged youth in the 21st century.

Future Directions

Future directions for the training of school counselors will require comprehensive planning and the involvement of school stakeholders, including school-based educators, policy makers, counselor educators, students, and parents. Several recommendations are offered in developing a process for the implementation of school counselor training in the future.

Practicing school counselors should be involved in the development and implementation of school counselor training programs. Involvement of in-service master school counselors is important in the development and delivery of school counselor preparation programs. Practicing school counselors have firsthand knowledge of the skills and duties that are necessary to be an effective school counselor. As stated by Sisson and Bullis (1992),

> We hope that practicing school counselors will be afforded the opportunity to and will begin to take a proactive role in the design of these curricula. It will be through such ongoing scrutiny of educational needs that the field of school counseling can become consistent with the needs of the students who are served. (p. 114)

School district personnel should be better educated regarding the role of school counselors. School counseling training programs, in collaboration with departments of educational policy, administration, and curriculum and instruction, should work to ensure that future teachers and administrators understand appropriate tasks and duties of school counselors. It is possible for counseling faculty to work with faculty within these areas of university schools and colleges of education. Counseling faculty may act as guest lecturers or may coordinate a collaborative effort among school administration trainees, teacher trainees, and counselor trainees in order to help students understand how they will work together in the future. These students could be assigned group projects or presentations for credit within their respective courses. In addition, school counseling training programs can reach out

to school administrators currently employed by school districts and coordinate training activities such as staff development workshops to promote understanding of the role and potential of the school counselor in their schools and districts.

Faculty who teach required school counseling courses should have some knowledge of school counseling and should understand how to incorporate school counseling content into their courses. For faculty members who are not familiar with school counseling, professional development training could be offered within their programs or funds could be allocated for professional development outside the program. Faculty can visit and observe school counselors in action. It may be possible for faculty who are unfamiliar with school settings to work with their local school districts in various ways in order to become better acquainted with the culture of schools. It may also be possible for faculty members to work with other faculty in related university departments (e.g., curriculum and instruction) who are familiar with schools in order to incorporate school-related issues into counseling curricula and courses. Collaborative opportunities may exist through joint research activities, guest lectures, and consultation with schools. University programs that offer doctoral programs in counseling and counseling psychology may also offer training opportunities for doctoral students to prepare a new generation of counseling faculty who have some school-based experience. The training may include practicum and internship placements in the schools, supervision of master's students in on-campus practicum courses, and participation in school-based research and evaluation projects.

Some training components, but not all, should be specifically focused for school counselor trainees. School counselors have specific training needs in areas of counseling that their peers in other counseling specialties may not. For example, the importance of training in advocacy, public speaking, data-driven decision making, and collaboration should be emphasized in school counselor training. In addition, school counselor trainees need to be informed about the culture of schools, and the roles of different professionals in the schools (e.g., school psychologist, special education teacher, school social worker). Students will also need training in brief counseling, group work, and child and adolescent counseling (Jackson et al., 2002). School counselor trainees should be well instructed on school-based prevention and intervention theories and applications (Keys, Bemak, & Lockhart; Romano & Kachgal, 2004, 1998). Since school counselors are increasingly called on to be activists and leaders in schools to promote practices and policies that encourage student development (Stone & Dahir, 2006), they must learn these skills, along with training in collaboration and partnership formation. Finally, school counselor trainees must develop skills in program evaluation, research methods (qualitative and quantitative), and how to effectively present their findings to professional and lay constituent groups. Some courses will also cut across the different counseling specialties, such as counseling theory, career development, multicultural counseling, and ethics. Even within these courses, however, it is useful to structure assignments and content that addresses their applications in school settings.

The school counselor training curriculum should be standardized. Stickel (1995) found that there was wide variability in training programs in areas such as the number of credit hours required, accreditation of training programs, practicum/internship experiences, and methods of student evaluation. In another study, Bradley and Fiorini (1999) found that there was no uniform requirement of a multicultural counseling course. Because school counselors are credentialed by state departments of education, there will be variability across the country in order to meet state license or certification requirements; however, as a profession, it behooves school counselors and counselor educators to come to an agreement, without imposing rigidity, about the most effective curriculum and training components of training. Although CACREP offers standards, and ASCA and TSCI have offered practice and training models, there is not always agreement about the curriculum for school counselor trainees. Programs should be allowed the flexibility to tailor their programs to their students' needs and the local context. The question that should be asked when designing school counseling curricula, therefore, should not be, "Does this conform to CACREP (ASCA, TSCI) models?" but rather, "Does this program fully consider our students' needs in order to prepare them for the changing world of school counseling and the districts where they will seek employment?"

Effort must be made to recruit school counselor students who represent a wide variety of cultural backgrounds. Diversity is a reality in U. S. schools, with dramatic increases projected in the years ahead. The changing demographics will affect schools, and school counselors must be prepared to respond in a prosocial manner. School counselor training programs should exert effort to recruit potential school counselors who are members of traditionally underrepresented populations into the field of school counseling. Once accepted into school counselor training programs, students will need a safe place to gather and share experiences. A mentor program may be beneficial, so that students of

color feel welcomed and supported in their programs. The TSCI institutions have made concerted efforts to recruit students from communities of color through recruitment in school districts, community media outlets, and mentoring of undergraduate students.

Multicultural counseling competencies must be a goal of all school counselor training programs. School counselor trainees must be given knowledge and skills related to addressing student diversity in school communities. Diversity includes not only U.S. ethnic and gender diversity, but also diversity of sexual orientation, disabilities, and international populations. The learning of multicultural counseling competencies should include a field component in which students are actually interacting with diverse populations, rather than just learning about diverse populations in textbooks or classroom activities. Additionally, school counselors must be trained regarding how to help their school community learn about the importance of understanding cultural differences.

Field experiences should be integrated into the student's program of study from the very beginning of the training program. Students should be provided with opportunities to experience the culture of schools in fieldwork prior to their practicum placements. These experiences may include a variety of school-based experiences. For example, in a career counseling course, school counseling students could observe a career counseling session at a high school, while the counselor uses an online career counseling resource. Someone interested in the career development of elementary school children could assist a school counselor in preparing and delivering an in-class group lesson in which students play a game that encourages them to explore future career possibilities. In addition, the initial field experiences can be integrated as assignments in regular courses. As another example, a program can require school counseling students to engage in three days of shadowing an elementary school counselor, a middle school counselor, and a high school counselor, to help students decide at what level they would like to focus as school counselors. Finally, mentoring programs, in which school counseling students are assigned to a practicing professional school counselor over a given period of time, have also been found to be successful as an induction into the school counseling profession (Jackson et al., 2002).

Field experiences should include a wide range of activities. In order for school counselor trainees to be prepared for a career in school counseling, they should have the opportunity to experience and be supervised in a wide range of duties and responsibilities that are necessary in the new models of school counseling practice. These include activities such as advocacy, use of technology, and program evaluation. Stickel (1995), however, found that some trainees were involved in activities that were non-counseling related such as student discipline, and general staff and clerical duties. Stickel also found that trainees spent less time than was desirable in individual and group counseling and consultation. While most school counselor supervisors provide adequate administrative and programmatic supervision to students, more supervision of counseling skills are needed (Roberts & Borders, 1994). Sisson and Bullis (1992) found that at the elementary level, counselors wanted more training in their graduate programs in consulting skills with teachers, and at the middle and high school level, counselors wanted more training in consulting skills with health service professionals and community leaders. Freeman and McHenry (1996) support the need for counseling and consulting skills, and they support Lanning's (1986) emphasis on training in professional issues and ethics. In their integrated approach for supervision of school counselor interns, Nelson and Johnson (1999) stress the importance of counselor trainees learning self-supervision skills. They wrote, "Considering that the internship typically marks the end of graduate training and possibly the last time that school counselors will receive any formal supervision, it seems prudent to culminate the evaluation process with a focus on self-supervision skills" (pp. 97–98). Students should also be informed of the importance of continuing their education and supervision, and should be introduced to sources of continuing professional development and potential supervision (Nelson & Johnson). Students also must have opportunities to utilize leadership skills under supervision such as serving on important school committees. Finally, school counselor trainees can assist with program evaluation projects, such as being involved in project planning, data collection, and presentation of results to stakeholder groups.

Applied experiences must be managed skillfully within an overall training model. Good communication must exist between the trainee, the on-site supervisor (an experienced school counselor), the on-site administrator (usually the school principal), and the professor in charge of the practicum or internship experience (Jackson et al., 2002). The site supervisor and university professor should have face-to-face or telephone contact in addition to periodic written evaluations of the trainee. The on-site administrator should be provided information about the internship or practicum and should receive contact information for the university professor as well. A handbook that includes expectations of the site supervisor, guidelines for the student, evaluation forms, and contact information will facilitate communication. Collaboration with a school district is

essential in order for the two entities to be familiar with and support each other's goals and training objectives (Blackman, Hayes, Reeves, & Paisley, 2002). Stickel (1995) found that trainees wanted better and more established practicum and internship sites and more quality control of sites, which could be remedied with strong university–school partnerships. In order for the site supervisor to create an environment and relationship with the trainee that allows for two-way feedback and open communication in a safe environment (Bernard & Goodyear, 2004), expectations of the site and site supervisor should be clearly articulated by the training program and agreed upon by the supervisor and training program. These expectations may include (a) supervisor qualifications and credentials, (b) a certain number of required hours of supervision per week, (c) student learning expectations (e.g. learning contract), (d) expectations about introducing the student to the site, (e) supervisor evaluations of trainee, and (f) expectations regarding communication with the university.

It is also important to explicitly state student expectations. These may include (a) required coursework concurrent with the practicum or internship, (b) required hours in direct contact with students, (c) required individual and group supervision, (d) required assignments, including written self and site evaluations, (e) appropriate use of supervision, and (f) consultation about ethical dilemmas. It is important that the practicum or internship agreement between the site, student, and university be signed by the relevant parties.

School counselor supervisors should be trained in supervision theory and skills. Most practicing school counselors, while familiar with the typical duties and expectations of school counselors, have not received training in supervision (Henderson & Lampe, 1992; Jackson et al., 2002). Peace and Sprinthall (1998) stated that it is important to train school counselors in supervision methods to strengthen their supervision of school counselor trainees. They have indicated that training programs should consider trainees' needs. Therefore, the supervision model used by school counselor supervisors should be flexible and should consider trainee professional development stage and supervisor roles (Nelson & Johnson, 1999; Sisson & Bullis, 1992). Nelson and Johnson developed a model of counselor supervision that integrated the models proposed by Littrell, Lee-Borden, and Lorenz (1979) and Bernard (1979, 1997). The Nelson and Johnson model is flexible because it incorporates stages of the supervision process with supervisor roles and the skills and needs of trainees.

More outcome research must be conducted in the area of school counselor training. As reviewed earlier, there has not been enough research in the area of school counselor training to determine which models are most effective. Of course, one's perception of effectiveness or whether a school counselor is adequately trained depends on one's definition of the role of the school counselor. The efficacy of a counselor's training on any given school or district is strongly impacted by the support of administrators for counselors to engage in appropriate activities. A number of questions must be answered before it is asserted that any given training program is more or less successful compared with others at preparing school counselors. Research questions that must be answered include, "What are the differential outcomes for school counselors trained under different training models and structures? For example, are school counselors who are trained under the TSCI model more successful than those trained at a non-TSCI training program?" "Do new counselors feel prepared for their work in the schools, and how are they received by administrators, teachers, parents and other stakeholders?" "Are trainees developing the needed skills as they move through their graduate program, and does their self-efficacy increase?" and "What are the long-term effects of school counselors' work on the academic and personal development of students?" Other research questions include, "How do students respond to counselors trained under different models?" "Does the training of school counselors impact student attendance, disciplinary referrals, postsecondary plans, and academic achievement test results?" "What are students' and parents' perceptions of being welcomed by the school, and how accessible are the school counselors?" and "Are school counselors skilled to address the needs of multicultural student populations, and are they skilled in advocacy and community outreach?"

We recognize that complete answers to questions such as those posed above are difficult to answer, and the school counseling profession is not the only profession that needs to conduct research on effective training models. Public education is continually debated, however, at local and national levels, regarding its effectiveness and appropriate allocation of public resources. School counseling is often a part of this debate, as stakeholders assess how best to utilize limited educational resources, during a period of intense pressure on public schools to meet the myriad needs of students and communities. Universities that train school counselors must produce graduates who will make a major impact in the schools, and programs must engage in regular evaluation of their training models to help assure that their graduates are meeting the needs of students and their schools. The newer training and practice models of school counseling offer an opportunity for university programs, school districts, and the school counseling profession to come together to evaluate the efficacy of these models.

Summary

In many respects, the profession of school counseling is at an important crossroads. As the educational enterprise in the U.S. and abroad receives increased scrutiny, and as key education stakeholders demand greater accountability of schools and student learning, it is imperative that universities evaluate their school counselor training programs to assure that they are graduating school counselors who are exceptionally well prepared to contribute to the needs of students and schools. School counselor training programs must assure that they recruit students with a vision of school counseling that reflects the newer training and delivery models of school counseling practice. School counselor training programs must adjust their programs to graduate students who are not only knowledgeable about traditional counseling and psychological theories and skilled in counseling techniques, but also are informed about contemporary schools and skilled in the delivery of the most current models of school counseling practice. Student field experiences must be carefully selected to give students important learning activities under the supervision of a master school counselor. School counselors must receive training through which they develop competencies in multiculturalism, advocacy, and educational accountability, and they must be encouraged to become leaders in their schools and communities and to become advocates for needed school reforms. Further, not only must school counselors be skilled in crisis intervention and remedial counseling, but they must also know about prevention science and must be skilled in the development of prevention interventions that will reach large numbers of students. Given budget constraints, it is unlikely that a counselor's large student caseload will be reduced in the near future, and therefore, school counselors must be innovative in effectively serving the total student population. Finally, school administrators must be adequately educated to help them understand the appropriate roles of school counselors so that the considerable knowledge and skills of school counselors are not wasted on clerical and administrative tasks that erode the school counselor's effectiveness.

School Counselor-Centered Training: The Ideal Program

While our ideal program incorporates some of the traditional elements of school counselor training models, the biggest difference is that our training program is school counselor–centered. The needs of school counselor trainees, students, parents, and communities are of paramount importance. This training program should be completed in two academic years, culminating with a master's degree and a school counseling license or certification. While we prefer the cohort model, flexibility should be allowed for nontraditional students (such as those with families or those who must work full-time) to complete the program in three years. While we estimate that the program will require 54 semester credit hours to complete, variations may depend on university and license requirements.

It is understood that the reality of school counselor training programs usually will not allow for completely separate sections or courses for school counselor trainees, and classes may be completed in other university departments (e.g., human development, social work, or psychology). However, these courses can be supplemented, however, by small group sessions that apply the course content to school counseling practice. These sections can be taught by instructors knowledgeable about the practice of school counseling (e.g., master school counselors from the community). The sessions could be integrated with student field experiences. In any given course, instructors could separate students according to interest (e.g., school counseling, community mental health). Different readings and assignments could be required depending on area of interest. For example, in a career counseling course, school counselors may focus on career exploration and college major selection, and appropriate career development models of middle school students. In an ethics course, students can be given ethical dilemmas commonly faced by school counselors. We also recommend that school counseling students be placed in practicum courses and on-campus supervision groups with other school counseling practicum students, rather than in heterogeneous groups of students who are completing their practicum in different types of settings (e.g., community mental health).

The following is an example of one possible program of study.

Semester One

Field Placement: First Encounter With School Counseling Students are assigned to a school and school counselor supervisor for one semester or the entire school year. CACREP calls this a "practicum," and 100 hours is required. Some programs may be able to arrange for their students to participate in field placements at the elementary, middle school, and high school levels across one academic year. This is especially important for school counseling students who have not previously worked in a school environment. School counseling practicum students will begin by observing professional school counselors and participating in nondirect service roles, such as staff development, navigation of career exploration software, and organization of school mentoring programs and the guidance curriculum. They can

gradually be allowed to provide some direct services, such as participating in classroom guidance activities, individual academic advising, and individual or group career counseling services, perhaps in a co-counselor role. A total of 40 direct contact hours (i.e., time spent with students, teachers, and parents) should be completed by the end of the practicum placement. The main point of this initial experience is for students to become familiar with a school environment and school counselor responsibilities and activities.

Counseling Theory In this course, students learn about counseling theories and the history of counseling, including school counseling. Students learn about counseling theories that are typically applied in schools and how they might be useful. These theories will include person-centered, brief counseling models, and cognitive–behavioral counseling. Other approaches that are sometimes used in school, for example, the use of play, art, and narrative approaches, can also be included.

Multicultural Counseling This course may be best taught in the first year to help students fully realize the importance of the cultural context in which students live. Issues related to cultural bias, stereotyping, and prejudice must be covered. Course activities should provide opportunities for students to examine their personal histories and increase their own self-awareness related to issues such as race, ethnicity, gender, and socioeconomic status. Students should also be taught models of advocacy and leadership to promote tolerance and reduce discriminatory practices. The course should include both didactic and experiential learning.

Helping Relationships The instructor of this course should be cognizant of the fact that school counseling students will have specific, unique needs and, therefore, will allow for flexibility in assignments and classwork. When requiring students to write an informed consent statement, for example, the instructor will allow students to write a "Welcome to Central City Guidance Department" statement which, while informing students and parents of their rights, is written in a more family-friendly or child-friendly manner. Students should also learn counseling skills appropriate with children and their parents.

Introduction to School Counseling School counseling students "rule" here! Uniquely designed for only school counseling students, this course intends to prepare school counselors for their unique roles in schools. Students are taught consultation, how to interact professionally with parents, how to not "side" with a high school student when the student complains about a teacher, and how to communicate effectively with principals. Students learn how to work within the broader community and collaborate with cultural leaders. The course should be flexible according to the needs of the community and the students, and it should address common school counselor activities at the different educational levels. Finally, the course should inform students about the use of technology in decision making, and it should require technology-enhanced presentations for student presentation assignments.

Semester Two

Field Placement Continues It may be preferable for students to change school settings the second semester to have a broader experience as well as the opportunity to interact with another school counselor supervisor.

Group Counseling It is important for school counselors to be competent in leading a range of groups in schools (i.e., support groups, psycho-educational groups, and task groups). Students should develop skills leading informational groups for parents and community leaders, and leading task groups of stakeholders. Graduate students should be given the opportunity to observe or co-facilitate a group in a school setting. Students should become familiar with the Association of Specialists in Group Work Best Practice guidelines.

Ethics It is important for the instructor of this course to be familiar with the unique ethical dilemmas faced by school counselors. For example, is it appropriate for a school counselor to be the head coach of the girls' basketball team? Is it appropriate for the school counselor to date a teacher or a child's parent? How do school counselors keep case notes, if any? How do school counselors protect their students while respecting parents' rights? Who is the "client" of the school counselor: parent, student, teacher, or administrator? In addition to professional ethical codes (i.e., American Counseling Association) and ASCA Best Practices Guidelines, the course must familiarize trainees with state (and perhaps school district) rules and regulations concerning issues such as confidentiality, informed consent, duty to warn, and reporting possible abuse.

Career Counseling Developmental models of career counseling are preferred for school counseling students, recognizing that career counseling used with high school students is not appropriate for elementary children. Post-high-school planning is appropriate for high school students, but acquainting children about careers and decision-making are more appropriate for elementary school students. School counselor trainees should become familiar with relevant assessment instruments, such as aptitude,

achievement, and interest tests, and with career exploration computer software.

Contemporary Student Issues In this course, students become familiar with topics that are most pressing for children, adolescents, and their families. Important topics for school counselor trainees to learn about include crisis intervention, school violence, suicide, sexuality and sexual harassment, drug and alcohol use and abuse, teen pregnancy, dropout prevention, gangs, divorce and custody laws, child abuse (including specific information about how to report and handle the aftermath), and bullying. Special populations within the schools, such as gay and lesbian students, immigrant and refugee students, students who receive assistance through special education, gifted and talented students, and unmotivated students, can also be addressed in this class. Graduate students should also learn about broader issues related to schools and how they affect students (e.g., state and national achievement tests and legislative and political forces that impact school funding).

Semester Three

Practicum or Internship This is a more intense field experience that builds upon previous field placements. CACREP calls this an "internship," and 600 hours is required. Because graduate students have had school-based field experience, they are able to begin providing direct service early in their practicum setting. Counseling students should have the opportunity to work with students individually and in large and small groups and also to interact with teachers, administrators, and parents. Specific activities include individual student planning, crisis intervention, delivering guidance lessons, and consulting with teachers, administrators, and parents about student and school systemic needs. School counselor supervisors should be provided with training in supervision by the training program faculty, and students should be supervised on-campus through their graduate program by supervisors knowledgeable about school counseling. This supervision can be conducted in small groups of student peers. Depending on the number of school counseling practicum students, it may be preferable to form supervision groups based on the educational level of the practicum placement (i.e., elementary, middle, or high school). Some jurisdictions may require students to complete a practicum across three different levels of schools (i.e., elementary, middle, and senior high schools). While such a requirement may provide students with familiarity to determine which school counselor license they would like to pursue, it may not actually allow them enough time to determine which environment is best for them. In addition, this requirement seems unnecessary for those who know they would like to work at a specific level. Some states may license counselors across K–12 grades and may allow students to complete a practicum at the elementary school level, but accept a job later at the high school level. This allows flexibility for the school counselor trainee, but may not allow for full familiarization with different needs at the various levels.

Statistics and Measurement School counseling students must be conversant in basic statistical and measurement techniques to understand the professional literature and to develop strategies to evaluate their programs. These classes ideally focus on applied statistics and measurement, with students using examples of concepts and data from school situations. Students should learn about statistical computer software and ways to present statistical information to be meaningful to education stakeholders. Students should also learn concepts from measurement theory to adequately evaluate and use psychological tests with their students.

Child/Adolescent Development School counseling students must be knowledgeable about child and adolescent development across the domains of social, cognitive, and emotional development. With this background, school counselors learn what is developmentally appropriate for students in order to assist teachers, administrators, and parents in understanding students. An understanding of child and adolescent development also helps school counselors promote the most effective and developmentally appropriate interventions for students.

Semester Four

Practicum or Internship The practicum/internship assignment continues as summarized above; however, the trainee should have responsibility for increasingly demanding school counseling activities under supervision. Trainees should also be encouraged to engage in self-supervision and reflection and to articulate ways that they manage stress and care for themselves.

Research Methods and Evaluation Students learn how to develop surveys and questionnaires in order to evaluate their programs. They learn and practice the fundamentals of research methods, including qualitative research methods. At least some research examples should be relevant to the role of the school counselor. Experiential components are extremely important. Students should be asked to complete a research project that is relevant to a school context. Students should also be required to present their research project in some local forum (e.g., department poster session or local school district presentation). As presentation

aids, students should be encouraged to use computer technology to enhance their presentation (e.g., PowerPoint). It is also important for school counseling students to be encouraged to submit their projects to professional conferences and journals, perhaps with faculty as coauthors.

Assessment School counseling students must learn about psychological and educational assessments typically used in schools (e.g., intelligence, achievement, aptitude tests, and career interest inventories). It is also important for students to become familiar with assessments such as the clinical interview and measures of personality. Even if school counselors do not administer psychological and educational instruments, they will receive assessment reports and will be expected to understand the results and convey them to relevant parties (e.g. students, parents, teachers). For example, if parents receive a written assessment report from the school psychologist, the parent may ask the school counselor to interpret the report. Therefore, the school counselor must be able to read a psychological assessment report and translate it in a meaningful way to parents and other stakeholders. Other examples include interpreting the meaning of intelligence test results, of tests that assess learning difficulties, of SAT or ACT measures, and of state and national achievement tests. School counseling students should have direct experience administering, scoring, and interpreting some of the more common measures that they will use. They can also self-administer some others to better understand the tests. Finally, the course should give students skills to help them understand the quality of the technical information about any given test (e.g., reliability, validity, norms).

XXI
SUPERVISION OF PROFESSIONAL SCHOOL COUNSELORS

DIANA GRUMAN
Western Washington University
MARY LEE NELSON
University of Wisconsin–Madison

INTRODUCTION

It is rare to find a professional who emerges from a graduate training program and feels entirely prepared for the work that lies ahead. Inevitable gaps exist between the graduate school–based training and internship practice, and the personal and professional demands of the "real world." Time and experience may be needed to integrate and apply prior training experiences to professional practice. For example, research within the teacher education field suggests that it is not until a teacher's third year of teaching that he or she is prepared to implement many of the methods introduced during the teacher training programs because he or she is too busy simply "surviving."

Similarly, when a student leaves a counselor training program to embark on a career in the schools, he or she is only partially trained to provide competent, comprehensive services (Matthes, 1992; Page, Pietrzak, & Sutton, 2001). In part, the road through the induction period will become less rocky through time on the job. Time is needed, for instance, to understand the unique needs of the school and community in which one works. Time is also required to establish trust with colleagues both inside and outside the school. In addition, time is needed to learn how to navigate the politics of the building and district including styles of leadership and competing agendas as one tries to find one's place in a team of educators.

In addition to the initial tasks that will be mastered through time on the job, other tasks facing school counselors will require considerable effort. In fact, numerous authors have stressed that these efforts should span a practitioner's entire professional career (Brott & Myers, 1999; Skovholt & Rønnestad, 1992). For example, counseling skills introduced during the graduate training program may need constant refinement. Knowledge obtained during graduate school can quickly become outdated. No matter how many years of experience, counselors may also encounter new types of cases or crisis situations that are baffling, ethically challenging, and stress provoking.

In addition to these individual challenges, school counselors who are proceeding down the path toward professional competency face a unique set of contextual challenges. First, pressing social problems intensify and fade in a very short period, requiring school counselors to stay abreast of current issues impacting their students. For example, while gang involvement may provoke a high level of panic in one year, the impact of proliferating meth labs in a community may eclipse the problems that gangs pose in the following year. Second, methods of treating people with problems are in a constant state of evolution. Counselors must seek out continual skill development regarding such things as medications for children's psychiatric disorders and best practices in reducing violence in the schools.

A final challenge is that school counselors work in the ever-changing political and social context of schools. Politically, national and local reform efforts to improve the system of education inevitably shape and reshape the priorities of all those personnel working within the walls of the school. Effective school counselors must understand and attempt to stay aligned with the new priorities and directions of their buildings and districts. Socially, the population of citizens in the United States is becoming increasingly more diverse,

with projections estimating a shift for European Americans from majority to minority status over the next 50 years (Sue & Sue, 2003). School counselors who have not already examined their prejudices, biases, and culturally embedded identities must make cultural awareness and action a priority in order to effectively meet the needs of students and their families (Paisley & McMahon, 2002).

A final concern about professional development for school counselors is that skill delivery in the training program is learned rather quickly, but timing and judgment in the use of skills takes much longer to acquire (Holloway & Neufeldt, 1995). Meyer (1978) found that, without supervision, skill levels decrease after training. Crutchfield & Borders (2002) were concerned with discover that practicing counselors scored in the subtractive range on a test of empathetic responding—a basic skill we might assume they had acquired at a certain level of mastery. Likewise, Granello (1997) found that, compared with their counterparts in mental health, community, and marriage and family counseling, who increased cognitive development with training, school counselors demonstrated a trend toward regressive cognitive development as they progressed in training.

Of most concern is a 10-year follow-up survey of school counselors who were rated by supervisors and teachers as low, average, and high in effectiveness (Wiggins, 1993). Contrary to the notion that school counselors, in general, will naturally develop greater competence with years of experience, results indicate that only 12 of the 193 evaluated counselors received a higher rating after 10 years on the job. In the sample, 33 counselors received lower ratings and 148 received the same effectiveness rating. Without a concerted effort to address these individual and contextual challenges, numerous authors have warned that practicing school counselors face a number of professional risks, including a regression in skills, stagnation, and burnout (Crutchfield & Borders, 1997; Herlihy, Gray, & McCollum, 2002; Meyer, 1978; Wiggins, Wilkerson, & Bellini, 2006).

Given the many challenges, it seems clear that, as they continue to work toward proficiency across their professional lives, professional school counselors will need to access many sources of development and support. Pioneering researchers Skovolt and Rønnestad (1992) proposed that counselor development is a multiyear process involving many different influences, wherein counselors greatly benefit from supervision, particularly early on. The process of moving from novice to skilled requires feedback from clients, peers, and more experienced professionals. Skovolt and Rønnestad suggested that with careful attention to training and supervision, proficiency may take a minimum of ten years. How do school counselors best tackle the wide-reaching need for ongoing training, supervision, and support throughout their careers?

The purpose of this chapter is to review what is known about supervising the journey of school counselors as they move from novice counselors fresh from training programs to more experienced professionals. We will examine the theoretical base and research findings surrounding on-the-job professional development and school counselor supervision. We will also examine the research on potentially supportive practices that may help counselors move smoothly toward competence and effectiveness. Finally, we will review the latest innovations regarding professional development and future directions.

THEORY

The Role of Supervision in Counselor Development

The development of counseling expertise is a fuzzy process. It is not linear or straightforward, and in the case of school counseling, it usually feels like "learning on the fly." So many circumstances arise daily in the life of a school counselor that it would be impossible to write a textbook or a series of textbooks that could address every potential challenge. Supervisors can play a vital role in assisting new professionals to manage the uncertainty inherent in the school counselor role. In fact, research on stages of counselor development tells us that supervisors exert a strong influence on new professionals' conceptualizations about their work, decisions about how to practice, and development of a professional identity (Skovholt & Rønnestad, 1992). Counseling students and early professionals relies on supervisor expertise—either *in vivo* or in memory—well into their first few years of practice.

Because learning to be an expert demands an understanding of how to manage ambiguity and complexity, developing professionals are thought to pass through a predictable set of stages. In counseling, this progression has been described as the integrated developmental model, or the IDM (Stoltenberg, McNeill, & Delworth, 1998). According to the IDM, Level One supervisees have limited training, or at least limited experience, in the specific domain in which they are being supervised. Both motivation and anxiety are high. Supervisees are focused on acquiring skills; they want to know "the correct" or "best" approach with their students and other clientele. At Level One, supervisees are dependent on their supervisors. They are highly self-focused, but with limited self-awareness, and they are apprehensive about evaluation. Thus, they need structured education, positive feedback, and little direct confrontation.

At Level Two, supervisees are transitioning from being structure-dependent to being structure-independent. They

experience fluctuating confidence. Although functioning more independently, they may experience conflict between autonomy and dependency, much as one does in adolescence. This conflict can manifest as pronounced resistance to supervisors and superiors. With regard to awareness, supervisees at Level Two have a greater ability to focus on and empathize with their students; however, "balance" is still an issue. In younger supervisees, the problem may become manifest in role confusion and enmeshment with their students and students' families. Supervision can be somewhat turbulent in this stage. Supervision of the Level Two counselor may require supervisors to recognize the resistance and/or enmeshment as developmental in nature and to work to facilitate the supervisee in his or her growth toward autonomy.

The Level Three supervisee has achieved a degree of autonomy and tends to focus more on a personalized approach to practice, as well as on the use and understanding of "self" in counseling. Motivation is consistent; occasional doubts about effectiveness will occur, but will not be immobilizing. A solid belief in one's own professional judgment has developed as the supervisee moves into independent practice. Supervision tends to be more collegial, as differences between supervisor and supervisee expertise diminish.

Level Three supervisees return to being self-aware, but with a very different quality than at Level One. Supervisees at this level are able to remain focused on the students while also stepping back to attend to their own personal reactions to the students and using this awareness in decision making about students.

Stoltenberg et al. (1998) proposed a second phase to Level Three development: Level Three, Integrated (Level 3i). At the integrated phase of Level Three, the supervisee is able to apply developing knowledge and awareness across domains of work. Thus, a school counselor at this level would feel confident across tasks such as developing guidance curricula; interacting with parents; interacting with administrators, teachers, and other school personnel; and mastering the technicalities of scheduling and advising practices. Though not completely seasoned, the supervisee at this phase also feels confident in assessing student needs and developing collaborative interventions to address them. Supervisees at this level are able to identify their strengths and weaknesses and can make good use of supervisors who assist them in this process and help them to identify sources of continuing education.

Continuous Professional Reflection: The Key to Developmental Progress

Though counselor development may seem to progress along a linear pathway, counseling professionals occasionally encounter situations that challenge their current procedural models of how to handle situations and result in crisis-like experiences. A good example of such a situation is feeling confident about knowing how and when to make a report to child protective services regarding the abuse of a child. You have had several experiences of doing so and you have even developed a relationship with someone in the agency upon whom you can rely. A situation arises with a student who confides in you that her father has beaten her on several occasions and threatened to kill her and her siblings if she tells. She has no observable symptoms of abuse, and other school personnel have told you that protective services have investigated the home previously but could not get clear evidence from any of the children that abuse was occurring. You fear that reporting the student's allegations to protective services might result in further harm to the student.

This concern disrupts your procedural knowledge about how to address allegations of child abuse, and you experience the crisis of having encountered an unfamiliar "shade of gray" with respect to child abuse reporting. At times like this, supervisors can be extremely helpful. They can provide needed "inside information" about how these squeaky situations are handled in the school or in the district, they can help the counselor with cognitive dissonance and fears about negative outcomes for the student, and they can provide needed support throughout the process.

With new knowledge and experience with managing a complex, challenging situation, the developing counselor can again relax and feel confident because he or she has developed another level of informational and procedural understanding. Unfortunately, however, calm is only temporary in the life of a school counselor. The complexity of the job ensures that new crises will erupt and that wise supervisors will be necessary to provide brainstorming, information, and support.

It takes complex skills to think through complex problems. Optimal development of expertise relies on an attitude of openness and willingness to reflect on one's learning process (Neufeldt, 1999; Neufeldt, Karno, & Nelson, 1996). This process of *continuous professional reflection* (Skovholt & Rønnestad, 1992) involves observing one's work, as well as one's thoughts and feelings about decisions that go into the work. Given the contextual challenges facing school counselors, such as the diversification of the population, reflectivity must be practiced continuously to provide responsive and ethical services.

Reflectivity is a process one may undertake after completing a task (much like debriefing after a practice counseling session or viewing and discussing a taped session with a supervisor). Schön (1983) referred to this process as "reflection on action." Reflectivity can also take place while

one is in the process of doing a task—a kind of "thinking on one's feet." Schön referred to the latter as "reflection in action." When professionals have developed reflective skills, they are armed with the capacity to process problem situations more quickly and seek productive courses of action. Professionals who learn reflectivity skills are less prone to "premature foreclosure" of development (Skovholt & Rønnestad, 1992); that is, they are less likely to get stuck in brittle, rigid ways of thinking and working that can ultimately lead to dissatisfaction and burnout. Through careful feedback and questioning, supervisors can be helpful in assisting counselors to develop reflective skills that will last a lifetime.

Reflectivity is both a skill and a propensity. The word connotes a capacity to identify areas of one's work that need to be examined, to engage in thorough processing of these situations, and to identify courses of action based upon engagement with them. Reflectivity also implies capacity for self-examination, including consideration of the impact of one's behavior on others and identification of more productive ways of relating. A good supervisor does more than simply share information or provide skills training. He or she provides a sounding board for the developing counselor, offering encouragement for the counselor to wrestle with problems. A good supervisor provides an opportunity for the developing counselor to engage in self-examination in a safe and supportive relationship.

The Supervision Needs of School Counselors

Skovholt and Rønnestad's (1992) work illustrated how professional counselors continue to draw on supervision experiences well into their careers; however, those authors did not specifically investigate the experiences of school counselors, who may or may not benefit from standard forms of clinical supervision. The use of *clinical supervision* has been the most widely discussed method of facilitating professional development for school counselors. Supervision, in general, has been defined as an intensive, interpersonally focused, one-to-one relationship in which one person is designated to oversee the work of others with the express purpose of improving performance and enhancing professional development (Feldstein, 2000; Henderson & Lampe, 1992; Loganbill, Hardy, & Delworth, 1982).

Clinical supervision, specifically, often refers to a relationship focused on direct service delivery or enhancing the clinical knowledge and skills for working with individual students, groups, or in consultation with parents or teachers (Roberts & Borders, 1994). The focus on clinical supervision for school counselors most likely stems from the profession's roots in therapy and clinical practice. As Holloway and Neufeldt (1995) remarked, "supervision is embedded in our beliefs about what constitutes training in psychotherapy" (p. 212).

While supervision may be an essential element in ensuring that counselors become competent and developed professionals, a number of persistent barriers to providing quality clinical supervision in the schools have been identified, including a lack of funding and a lack of time to conduct supervision (Crutchfield, McGarty, Pennington, Richardson, & Tsolis, 1997). An additional barrier, pointed out by Sutton and Page (1994), is that counselors themselves may not seek out clinical supervision because they lack awareness of why supervision may be helpful and are not sure how to obtain it. Moreover, school counselors may anticipate that traditional clinical supervision may not provide them with the skills and knowledge they need to operate within a school setting; thus, they may feel stymied about how to acquire the help they truly need.

These findings raise the question: Given observed barriers to the provision of clinical supervision for school counselors, are there are other avenues for development and support that may meet school counselors' professional needs? Further, given the demands of school reform efforts such as No Child Left Behind, are school counselors facing professional development demands that reach beyond the common scope of clinical supervision? In the following sections, we will take a comprehensive look at the research on the many avenues of supervision and professional development available to school counselors.

RESEARCH

The need for supervision within the counseling field has been widely recognized for decades (Bernard & Goodyear, 2004). Yet the dialogue regarding appropriate supervision and professional development practices for *school counselors* was not initiated in journals until the mid 1970s. Referring to the lack of adequate supervision provided to most school counselors, Boyd and Walter (1975) likened the school counselor to a cactus plant, suggesting that "both survive on a minimum of nutrients" (p. 103), and they called for increased attention to school counselor professional development.

Since the early writing on the topic, numerous authors have stated concerns regarding inadequate practices and limited research (Barret & Schmidt, 1986; Brott & Meyers, 1999; Crespi, 1998). Professional organizations have also weighed in on the issue. In 1989, the AACD (now ACA) School Counseling Task Force declared a need for counseling supervision of practicing school counselors, concluding that, "proper supervision of school counselors is lacking at best, nonexistent at its worst" (p. 20). Recognizing the lack of research, they also recommended that counselor educators

at the university level take a lead in initiating new research studies. In the years since the AACD report, many articles have been published, but the empirical evidence regarding effective means of supervision is very limited (Agnew, Vaught, Getz, & Fortune, 2000; Crespi, 1998).

What can we draw from the existing literature? First, a number of researchers have attempted to draw a link between supervision and job performance. Wiggins and Weslander (1986) found that counselors rated as most effective by their building administrators had higher ratings of job satisfaction, self-esteem, and tolerance for ambiguity than did their less-effective counterparts. Moreover, a recent study by Halverson (2000) demonstrated that school counselors willing to pursue ongoing training and supervision demonstrated higher levels of moral development than their counterparts, and that those with higher levels of conceptual development demonstrated greater levels of job satisfaction. Given that we do know that supervision—compared with no supervision—promotes counselor development (Wiley & Ray, 1986), we might be able to hypothesize that adequate supervision may contribute to counselor conceptual development, which, in turn, may promote job satisfaction and greater competence.

A number of surveys have made it clear that counselors themselves recognize a need for significant professional support. In a qualitative study of Australian school counselors, participants cited concerns regarding "blind spots," unchecked prejudices, and being "trapped into . . . using a narrow range of skills" due to professional isolation and lack of supervised practice (McMahon & Patton, 2000). Several surveys also have shed light on how practicing school counselors view their supervision needs. Participants in the Roberts and Borders (1994) survey of school counselors in North Carolina indicated that they wanted counseling supervision to enhance professional growth, provide professional support, and avoid burnout. In a national survey of American school counselors (Page et al., 2001) and a smaller Maine survey (Sutton & Page, 1994), participants' top two supervision goals included (a) taking appropriate action with clients and (b) developing skills and techniques.

Research also has revealed that many school counselors *wish* they had exposure to clinical supervision, but they do not *receive* it (Page et al., 2001; Roberts & Borders, 1994; Sutton & Page, 1994). For example, in a national survey, Page et al. found that 67% said they desired some type of clinical supervision, but only 24% were receiving it. This finding also implies that 33% of school counselors feel they have no need for clinical supervision.

As corroborating evidence, in their survey of National Certified Counselors (NCCs), Borders and Usher (1992) found that a large number of school counselors reported that they had no need for clinical supervision. They also found that school counselors (39% of the 357 NCCs in the sample) were different from other counselors in terms of their existing practices and reported need for supervision. Specifically, counselors in the schools received significantly fewer hours of postdegree supervision than community or private practice counselors. They also were more likely to be receiving no supervision and reported wanting supervision less frequently than their peers in other settings did. Finally, the authors reported that, "school-based counselors' most frequent reason for receiving supervision was that it was a requirement of the work setting" (p. 596) rather than a desire for professional development.

How might we explain why some school counselors feel they do not need clinical supervision and others feel they need more of it? It is possible that school counselors, such as those in the Borders and Usher (1992) study, who say they do not need clinical supervision think of it as supervision for traditional psychotherapists rather than as supervision for counselors in schools. Indeed, many traditional clinical supervisors who have not worked in schools may not understand the needs of or complex roles assumed by school counselors. Additionally, school counselors are commonly supervised by administrators or school principals who have little or no counseling experience (Borders & Usher; Mathes, 1992; Roberts & Borders, 1994). Perhaps as a result of negative experiences, the school counselors who lack interest do not think supervision is a worthwhile endeavor. The underlying problem is that the dearth of supervisors with adequate expertise leaves school counselors vulnerable to a lack of potentially valuable support and professional training.

On the face of it, reports of limited interest in and poor provision of clinical supervision raise ethical concerns. The ethical code of the American Psychological Association (APA; 2002) states, "Psychologists provide services, teach, or conduct research in new areas or involving new techniques only after undertaking appropriate study, training, supervision, and/or consultation from persons who are competent in these areas or techniques" (p. 4). This mandate suggests that professionals need consultation and supervision when they confront client difficulties that are outside the range of their experience. Second, the ethical code developed by the American Counseling Association (ACA; 1995) strongly suggests that professional counselors participate in ongoing and regular clinical supervision. In contrast to the specific guidelines regarding supervision in the ACA codes, the American School Counseling Association (ASCA) offers a much broader recommendation. ASCA focuses on professional development rather than taking a specific stand on clinical supervision. Specifically, within the professional responsibilities section of the ASCA *Ethical Standards for School Counselors* (2004) is the following statement: "The professional school counselor strives through personal initiative to maintain professional competence and to keep abreast of profes-

sional information" (ASCA, 2004, p. 125). The ASCA *Ethical Standards* also state, "Professional and personal growth are ongoing throughout a counselor's career" (p. 125). In contrast to the APA and ACA codes of ethics, the ASCA code seems to reflect the reality of counseling in school settings: Because of funding priorities in schools, professional supervision is largely unavailable to school counselors. All ethical codes, however, imply that a counselor is responsible for obtaining ongoing professional consultation.

If, as the aforementioned research suggests, few school counselors actually receive clinical supervision as a means of professional development, how do they comply with the ethical standards of their organization? Numerous articles shed light on how school counselors find ways to "maintain professional competence" and grow on an ongoing basis. First, informal networks of counselors in a region, as well as more formalized meetings of district teams, may be vital ways to combat isolation and stress (McMahon & Patton, 2000). These informal and formal networks may be the best way for geographically isolated counselors in rural areas to consult on critical supervision issues. Second, professional development activities provided through workshops and professional affiliations with state or national organizations may be critical components in terms of skills acquisition and program development (Fairchild & Zins, 1986). Counselors such as those working in elementary settings with no direct colleagues may breathe new life into their programs by attending workshops with peers who understand the challenges they face. Finally, a compelling argument was made by Barret and Schmidt (1986) that clinical supervision might be successfully augmented by other types of supervision, including administrative and program supervision

PROFESSIONAL DEVELOPMENT PRACTICES

Prevailing Trends and Recent Innovations

In this section, we review current trends and recent innovations in professional development practices. First, we address the contributions to school counselor development that can be made by administrative and program supervision. Second, we address peer group supervision practices and describe some proposed models for conducting peer supervision groups. Finally, we describe university–school counseling collaboratives and professional development schools as broader collaborative efforts to provide supervision and development opportunities for school counselors.

Administrative Supervision

Administrative supervision has been described as supervision focused on employee job performance and effectiveness, staff relations, and outreach to parents and other constituents (Henderson, 1994; Roberts & Borders, 1994). Administrative supervision appears to be the most common form received by counselors, given that school principals and district-level administrators often take a primary role in overseeing the work of school counselors (Schmidt & Barret, 1983; Sutton & Page, 1994). While concerns are frequently cited, several authors have provided a vision of how administrative supervision can be beneficial.

One school district in Virginia developed a professional growth program whereby counselors, with the support of administrators, created an individual action plan to target areas for professional development (Kaplan, Geoffroy, Pare, & Wolf, 1992). Progress was documented through written evaluations, observations, self-reports, video tapes, and teacher surveys. Preliminary evaluations indicated that the plans encouraged constructive dialogue between administrators and counselors and helped the counselors identify their strengths and weaknesses. The authors also speculated that, "administrator participation in the process encourages their continued support for [counseling] activities" (p. 168).

In Mississippi, mandated job assessments were required starting in 1982 and the Mississippi Counseling Association took a lead role in developing a set of counselor competencies to comply with the new law. Housely, McDaniel, and Underwood (1990) initiated a survey to investigate the impact of the new assessments. They reported that almost half of the counselors reported an increase in clarity of purpose as a counselor, feelings of competence, and feelings of self as a professional. The only significant change ($p < .05$), however, was in increased organizational skills. They also found that inexperienced counselors reported greater benefits from the assessment process than did experienced counselors.

Program Supervision

Program supervision is defined as supervision focused on program development, implementation, coordination, and evaluation. Given that school counselors working within the comprehensive contexts of the *ASCA National Model* (2003) and Developmental School Counseling and Guidance programs (Gysbers & Henderson, 2000, 2001) are called upon to develop large-scale preventative education programs, the elements addressed by a program supervisor, such as a lead counselor or district coordinator, may be critical to the success of a school counseling program. Again, rather than dismissing it as "beneath" the professional school counselor's standards, program supervision may be vital for success, given the programmatic demands on today's school counselor.

As an example, in a national survey of practicing school counselors, Fairchild and Zins (1986) found that over half of the respondents were collecting program accountability data to enhance their professional development. The researchers reported that counselors used the data in a number of ways including "demonstrating one's effectiveness to others (75.6%) and improving the quality of services (71%)" (p. 198). Of those counselors not collecting accountability data, the greatest percentage (52%) said they were not familiar with the methods for obtaining it. The authors emphasized that counselor training programs "need to play a more instrumental role in ensuring that counselors in training acquire self-evaluation and program evaluation skills" (p. 198). We would also suggest that program administrators take a lead role in guiding counselors through the process of data collection and evaluation.

A final example that combines administration and program supervision involves the use of performance evaluations in the restructuring of the Austin (Texas) School District guidance and counseling program (Synatschk, 2002). The 5-year restructuring process began when a team established a well-defined and accepted job description for counselors and created a yearly appraisal system. The appraisal process involved each counselor's completing a "campus priority plan" based on student needs assessments, reviewing the plan with the school administrator, collecting evidence of work in all areas of the comprehensive guidance model, and participating in a year-end evaluation conference. Though Synatschk did not collect data following the implementation process, she did report anecdotally that administrators gained a great appreciation for the benefits of a comprehensive counseling model.

Peer Group Supervision

In addition to the one-to-one relationships in clinical supervision models, several authors have nominated peer group supervision as an alternative, cost-effective means of providing supervision to school counselors (Agnew et al., 2000; Benshoff, 1993; Benshoff & Paisley, 1996; Crutchfield & Borders, 1997; Spice & Spice, 1976). Moreover, peer supervision may be experienced by members as more collegial and supportive, as well as less threatening, than clinical supervision based upon the hierarchical structure of the "expert" and "learner" configuration typically found at clinical training sites (Borders, 1991; Crutchfield & Borders, 1997).

Though professional ethical codes suggest that supervision should be provided by senior members of the same profession—a mandate that might seem to conflict with the practice of peer supervision—supervision is not a formalized professional activity in most school settings; hence, all school counselors are technically peers—both novice and seasoned counselors alike. The second author of this chapter has conducted numerous professional development groups for school counselors in which some members were much more senior than others. Moreover, a less experienced school counselor may have expertise in a particular area that more senior counselors do not. For instance, a novice school counselor with experience in the paraprofessional role of psychiatric technician may know more about psychotropic medications than other school personnel and thus be able to advise more senior counselors about a student's medication side effects. One way to ensure the quality of peer supervision is to have counselors with expertise in particular areas take the lead when a consultation is requested within their area of expertise. If no expertise pertaining to a particular problem exists in a consult group, a professional with experience in that area can be brought in as a guest consultant.

Peer group supervision can be organized in a number of ways. C. G. Spice and W. H. Spice (1976) described a triadic peer supervision model wherein counselors met on a weekly or biweekly basis to provide support and consultation to each other. As group members, the counselors served alternately in roles of supervisee, facilitator, and commentator, much in the same fashion as counseling students work in class as they are learning basic skills. These groups decide on their own membership, structure, and meeting times, based on supervision needs and interests such as particular theoretical orientations, grade levels served, and interpersonal attributes.

Borders (1991) proposed a structured group supervision format that offered multiple suggestions for participant roles, as well as group activities, including case presentation and recommendations, role playing, providing constructive feedback, and viewing case presentations from different theoretical orientations. Though the Borders model was generic and not limited to school counseling peer supervision groups, it provided detailed rationales and strategies for organizing and participating in peer group supervision and is a "must read" for any professional counselor group wishing to pursue collaborative peer supervision.

More recently, Benshoff and Paisley (1996) provided a format for nine-week structured dyadic peer supervision meetings. In their model, structured activities included examination of appropriateness of roles and expectations for counselors in participants' individual schools, discussions of needed changes in school counseling services at each participant's school, and ongoing review of counseling audio or videotapes. Early participants in the Benshoff and Paisley model indicated strong satisfaction with their experiences. Though the model was time-limited and designed for peer supervision dyads, recommended activities could easily be adopted and adapted as needed by collaborative peer supervision groups.

Crutchfield and Borders (1997) compared the relative effectiveness of the Borders (1991) and Benshoff and Paisley (1996) models and found that, regardless of format, participants expressed satisfaction and increased counseling self-efficacy as a result of their participation. Additionally, a qualitative examination of the effectiveness of the Borders model also yielded promising results (Crutchfield et al., 1997). Though more research is needed on the effectiveness of peer supervision, we strongly recommend that practicing school counselors make a serious effort to either join or initiate regular peer supervision meetings, whether in dyadic or group format.

University–School Counseling Collaboratives & Professional Development Schools

Collaborative professional development efforts between counselor education departments and school districts seem to provide support, renewal, and ongoing learning to professional school counselors, as well as counselor educators (Blackman, Hayes, Reeves, & Paisley, 2002; Hayes, Paisley, Phelps, Pearson, & Salter, 1997; Thomas, 2005). A collaborative between the University of Georgia School Counseling faculty and the Clarke County School District has been ongoing since 1992. School counselors and counselor educators meet for 3 hours monthly at the university campus to discuss mutual concerns, share information, and participate in professional trainings. A qualitative program evaluation of this effort revealed that participants found the collaborative to be a source of personal and professional renewal and support, professional development, and sense of community (Blackman et al., 2002). School counselors revealed that this type of participation shattered their sense of isolation and contributed greatly to a sense of validation that they were doing a good job.

Similar opportunities for ongoing support and training may be available through professional development schools, wherein a college or school of education partners with a school to provide collaborative education and training to school personnel, faculty, and education students (Clark & Horton-Parker, 2002). Splete and Grisdale (1992) described a professional development academy for school counselors in 28 districts in Oakland County, Michigan. Academy participants attended a full day of training per month for 12 months. Those who wished to receive continuing education credit for participation were able to do so. Needs assessments at the beginning of each academy year identified training content that would be specific to practicing counselors' current needs. Evaluations of the Oakland Academy were uniformly positive, with participants indicating that academy participation increased their motivation, perceived counseling efficacy, and professional sophistication (Waidley & Pappas, 1992). Subsequently, academies for school counselors based upon the Oakland Academy model have been established in several Michigan counties. Though research has not yet established the relationship between self-efficacy and professional competency, one can hypothesize that the combination of experienced self-efficacy and motivation would enhance outcomes in school counseling.

FUTURE DIRECTIONS

Clearly, there is a voiced need for increased supervision for school counselors. Evidence also points toward the benefits of ongoing professional development for school counselors in terms of sense of community, enhanced self-efficacy, experiences of professional support, validation for good work, and burnout prevention. Moreover, ethical codes of both ACA and ASCA emphasize the importance of regular supervision or pursuit of professional development opportunities. Our ongoing challenge as a profession continues to be how to provide these opportunities and to evaluate the outcome of our ongoing efforts. In this section, we summarize the critical issues we have addressed with regard to both practice and research on supervision of practicing school counselors and make recommendations for how professionals at all levels can contribute to counselors' ongoing development and provision of optimal services to students.

Implications for Practice

In their survey, Borders and Usher (1992) found that a majority of practicing counselors would like to have some form of supervision, and most would like supervision to be provided at their place of employment. Borders and Usher called for the training of more supervisors to meet the professional training needs of all postdegree counselors, including school counselors. Goodyear and Bernard (1998) contended that, ideally, supervisors of any profession should be senior members of the same profession who are actively pursuing their own professional development and who are trained supervisors. Likewise, Page et al. (2001) found that school counselors wished to be supervised by senior school counselors who were also trained supervisors. Given current funding limitations in American schools, it is highly unlikely that many districts will be able to provide such experts to supervise their counselors on a regular basis. Only the fortunate few will be able to avail themselves of such services. In addition, we recognize that many schools do offer school counselors excellent opportunities to consult with colleagues and other school person-

nel such as psychologists, nurses, occupational therapists, and speech therapists through participation in student intervention team meetings.

It is possible, however, for institutions such as school districts and universities to provide professional development for credit, as the Oakland County, Michigan, and neighboring districts have demonstrated. The creation of professional development schools has demonstrated how schools and universities can partner together to address common critical concerns.

Though research has shown that peer supervision groups and professional development efforts are effective in the sense that they can enhance motivation and self-efficacy, the field has yet to demonstrate what kinds of professional development and supervision opportunities are more efficacious than others or that represent "best practices." That is a goal for ongoing research efforts. Based upon the findings of the studies we have reviewed in this chapter, however, we would like to make the following recommendations:

- Counselor education programs should become familiar with outreach and continuing education units on their campuses for the purpose of offering for-credit, continuing professional education courses for school counselors. Continuing professional education courses might involve ongoing supervision in group format or systematic training in peer supervision formats.
- Counselor education programs should offer coursework in supervision to students in their programs, to postdegree school counselors, or to both. Ideally, this coursework should be provided by professional school counseling supervisors and should involve training on mentoring counselors within school settings.
- The professional training of school counselors should emphasize the importance of obtaining ongoing supervision during professional employment and practicing counselors' responsibility for getting that supervision. Such an emphasis should be a part of the ethical training of all school counselors.
- School counseling professionals should take it upon themselves, as an ethical obligation, to pursue ongoing supervision and professional development in the form of coursework, professional supervision, and peer supervision throughout their careers.

Implications for Research

Numerous authors have pointed out the dearth of research on school counseling supervision (Agnew et al., 2000; Bernard & Goodyear, 2004; Crespi, 1998). Moreover, Bernard and Goodyear addressed the need for more research on the effectiveness of supervision, especially for school counselors.

Research on school counselors is difficult to conduct because of the bureaucracy one must negotiate to get adequate sample sizes. Any given school often has so few counselors that many schools must participate in a large-scale data collection effort. This is one reason that survey research on school counselors is common. Qualitative methods also lend themselves to small samples, and numerous widely cited studies on counselor development and supervision process exist.

More work is needed, however, to document the types of supervision that contribute to ongoing professional school counselors' development and the efficacy of their work. We have identified the types of supervision that may be available to school counselors: (a) administrative supervision, (b) program supervision, and (c) clinical supervision. We have also recommended that professional school counselors participate in some form of peer supervision on a regular basis. An appropriate agenda for research on postdegree supervision would compare the relative contributions that each of these types of supervision makes to school counselor development and efficacious work. Both quantitative and qualitative methods would be useful in this effort.

CONCLUSION

Existing knowledge on the work lives of practicing school counselors suggests that there is an overall need for more supervision and professional development opportunities. Counselors who do not receive adequate postgraduate developmental supervision evidence greater burnout and stagnation. Moreover, without ongoing professional input, counselors—particularly those who work in isolation in one or more schools—can be at risk for unknowingly violating ethical principles. Peer group supervision and participation in professional development workshops can enhance school counselors' self-efficacy, motivation, and sense of community.

Though research has yet to document which professional development opportunities for school counselors are most efficacious, we believe that practicing school counselors are ethically obliged to pursue supervision and development activities throughout their careers. Further, counselor education programs in the United States should take a stronger role in supporting the work of school coun-

selors by providing ongoing professional development opportunities.

Multicultural Competence of School Counselors

According to recent estimates (U.S. Department of Education, 2003), students of color in elementary and secondary schools constitute nearly 40% of the nation's school-aged population. In states such as Alabama, California, Georgia, Hawaii, Illinois, Louisiana, Maryland, Mississippi, New Jersey, New York, and Texas, students of color represent over 70% of the school-aged population in many large and mid-sized cities. The multicultural competence of school counselors has received increasing attention in the literature over the past decade (e.g., Carey, Reinat, & Fontes, 1990; Holcomb-McCoy & Day-Vines, 2004; Lewis & Hayes, 1991; Reynolds, 1999). School counselors are challenged but uniquely poised to promote the academic, career, and psychosocial development of their students in light of the complex constellations of racial, ethnic, and socioeconomic backgrounds of their clients (Lee, 2005). As such, this chapter (a) discusses academic, career, and cultural considerations for school counselors in relation to working with students of color, and (b) delineates competencies needed by school counselors in their provision of culturally competent services to students of color.

Academic Considerations

Multiculturally competent school counselors recognize that family background and family expectations can shape the academic and educational aspirations of many students of color directly and through these students' educational experiences (Kao & Tienda, 1998). However, to address the needs and experiences of students of color, it is important that school counselors be wary of academic aspiration and achievement differences relevant to culturally diverse students. Kao and Tienda found that students of Asian descent tended to have higher academic aspirations than their Latino, Black, and White counterparts; notably, African American males were found to experience a decrease in their educational aspirations from 8th to 10th grade. However, their study also reported that although adolescents of color evidence high academic aspirations at any point in time, the maintenance of their high aspirations, however, is tentative.

Some students of Asian descent may be expected to perform well academically by their teachers as a function of the model minority stereotype (i.e., the belief that students of Asian descent tend to perform well academically, particularly in math and science courses and that their strong performance is indicative of positive psychological well-being). Additionally, students of East Asian descent may be influenced by familial and cultural values of filial piety, wherein their primary duty is to honor parents and elders (Shon & Ja, 1982), along with high educational achievement. In contrast, African American and Latino students, as compared with White students and students of Asian descent, may experience negative peer sanctions for excelling academically (Suarez-Orozco, 1991), which might partially explain differences in academic achievement and aspirations. Moreover, some students of color, particularly African American students, may have internalized Eurocentric standards that may denigrate their academic potential

and performance and may contribute to their struggle in building a strong sense of academic self-efficacy and performance (Constantine & Blackmon, 2002; Spencer, Noll, Stoltzfus, & Harpalani, 2001). On the other hand, some students of color who have developed a positive, authentic, and proactive internalized racial identity may possess coping strategies that thwart negative expectations of academic performance and, consequently, may exhibit higher levels of academic self-efficacy and achievement (Constantine & Blackmon, 2002; McMahon & Watts, 2002; Spencer et al., 2001). Hence, school counselors may promote the maintenance of academic aspirations among students of color by providing opportunities for these students to develop affirming cultural identity attitudes.

Some students of color may experience incongruities between worldviews informed by their racial–cultural backgrounds and the values and norms of the school and dominant society, which may factor into their academic disengagement at times (Schwallie-Giddis, Anstrom, Sanchez, Sardi, & Granato, 2004). These students may experience "cultural contradictions" (Allen-Meares, 1999), wherein they feel they are unable to relate their cultural heritage to that which is represented in the classroom. For example, some Latino students may struggle to identify with academic materials and educational content if they feel that their heritage and customs are not represented therein. Additionally, independent and competitive forms of learning in the classroom may conflict with cooperative and collaborative learning styles that are encouraged by collectivistic cultural value orientations (Butler, 2003).

Socioeconomic issues also have been hypothesized to contribute to racial disparities in educational aspirations to the degree that access to material resources enhances or detracts from some youths' dispositions to achieve (Kao & Tienda, 1998). For example, more than 35% of African American youth under age 18 live in poverty and are exposed to various negative environmental factors (e.g., unemployment, exposure to crime and violence, and financial struggles within the home) that can interfere with academic pursuits (Butler, 2003). Urban African American youth are often labeled "at risk" by researchers and educators and may be placed on vocational or trade-specific tracks geared toward low-wage jobs because they are not expected to succeed academically (Constantine, Erickson, Banks, & Timberlake, 1998). The overrepresentation of students of color in the lower socioeconomic strata has numerous implications for interventions that multiculturally competent school counselors may apply to encourage academic achievement among this population, including advocating for parity in the assessment of "at-risk" students.

Another hypothesis concerning racial differences in educational outcomes focuses on structural and social barriers that preclude access to educational and/or occupational success. According to this hypothesis, in response to classification in minority status, some people of color may overcompensate and achieve highly; others may internalize social meanings of minority status and negative stereotypes about their racial/ethnic group and become dubious about education as a means toward social mobility (Kao & Tienda, 1998). It is possible that this internalized racism can influence not only psychological well-being, but also career aspirations and development (Ladany, Melincoff, Constantine, & Love, 1997).

Cultural Considerations

The promotion of academic retention and achievement and positive psychosocial adjustment may not be mutually exclusive roles for school counselors, particularly with respect to complex needs of students of color and immigrant students (Kopala, Esquivel, & Baptiste, 1994; Sciarra, 2001). Over and above normative developmental concerns, students of color and immigrant students may experience multiple psychological and psychosocial concerns such as culture shock, racism, learning multiple cultural identities, school disengagement, depression, and intergenerational conflict (Constantine & Gushue, 2003; Yeh, 2003). However, these students may resist seeking help for these concerns from school counselors as a function of unfamiliarity with counseling, cultural mistrust attitudes, differences in expectations of service providers, somatic expressions of distress, or culturally appropriate values of forbearance (Constantine, Okazaki, & Utsey, 2004; Holcomb-McCoy). Despite differences in help-seeking behaviors between people of color and members of the dominant White culture, the majority of youth of color continue to receive counseling services from school counselors (Holcomb-McCoy, 2003). Moreover, in light of increasing rates of mental health concerns among school-aged children (e.g., depression, suicide, and attention deficit/hyperactivity disorder), decreased availability of community mental health programs (Lockhart & Keys, 1998), and increased attention to the psychological welfare of young people following the Columbine school shooting, school counselors are placed in critical roles to provide free personal mental health services to young people. Thus, it is critical for school counselors to be aware of and attentive to the psychological needs of students of color.

Upon meeting with students of color, culturally competent school counselors need to be cognizant of differences in affective expression across racial–cultural groups. For example, there may be cultural differences in the ways in which students of diverse racial and ethnic backgrounds express emotions as a function of values that encourage emotional restraint (Constantine & Gainor, 2001). School counselors need to be cognizant of how emotional states

are expressed differently across cultures, for they risk misinterpreting, pathologizing, and inappropriately treating students of color if they are not attuned to potential cultural differences in affective presentation. Similarly, it is valuable for school counselors to apply their knowledge and awareness of cultural differences in expressing empathy so as to attend effectively to diverse students (Constantine & Gainor).

Multiculturally competent school counselors also need to be aware of the diverse and complex concerns of newly arrived immigrant students. For example, students and families who are Jamaican immigrants may contend with racism, socioeconomic disparities, and job difficulties, whereas students from Iraq or Kosovo may contend with war-related trauma concerns (Williams & Butler, 2003). Despite differences in concerns among immigrant student populations, Williams and Butler outlined several primary issues faced by immigrant students, including English language acquisition, posttraumatic stress disorder, lack of social support networks, racial labeling and categorization, adjustment to different learning styles and expectations, acquisition of new cultural scripts (i.e., behaviors, ideas, thoughts, and role expectations that are specific to a given culture), and struggles to gain social acceptance. The degree to which school counselors interact with recent immigrant students and their families may be a function of how these psychosocial stressors impact their subjective (e.g., personal distress and dysphoria) and objective (e.g., academic difficulties or acting out) experiences; that said, it is possible that immigrant students who tend to maintain academic performance and avoid teachers' attention may not present their needs readily to school counselors, and thus may "slip between the cracks." Hence, culturally competent school counselors can address the potential needs of newly immigrant students through reaching out toward the immigrant student body by engaging with student groups and collaborating with immigrant community groups outside of school (Williams & Butler).

Linguistically and culturally diverse students may experience challenges to their racial and ethnic identity development within their families and in the larger society. Students may experience intergenerational cultural conflicts, wherein the students acculturate to the dominant society more quickly than their parents or guardians. Students may feel conflicted between how their values, influenced by both their parents' cultures and the dominant society's cultures, contrast with those of their family and community; similarly, parents and guardians may feel betrayed by their children's willingness to contest their ways of being and their cultural identity. Thus, concomitant with normative struggles of separation and individuation that can result in family conflicts, students of color may present with interacting challenges of intergenerational conflict.

Racial and ethnic identity development may present psychosocial concerns for students of color as well (Reynolds, 1999). As students' cognitive scopes broaden from egocentric to peer-centered, they may become more cognizant of how their race and ethnicity have subjective and social valence (Constantine & Blackmon, 2002). Moreover, students of color may encounter educational challenges to conform to the dominant society in order to succeed and thwart negative stereotyped expectations while maintaining allegiances to their racial–cultural reference groups (e.g., family, racially similar peers, and community members). It is possible that students of color switch codes between the differing racial–cultural contexts of family, peers, and school and begin to question the degree to which they are compromising their racial and ethnic identity. School counselors are in a critical position to validate these experiences of students of color, particularly before they enter postsecondary institutions, and encourage adaptive biculturalism (LaFromboise, Coleman, & Gerton, 1993). Through individual, group, family, and schoolwide interventions, multiculturally competent school counselors can provide a space for students of color to feel empowered about the strengths regarding their families' racial–cultural experiences and values, as well as their agentic decisions to navigate in the dominant culture without compromising their cultural sense of self.

Although many school counselors have been trained in traditional counseling paradigms to identify intrapsychic sources of presenting problem etiology, multiculturally competent school counselors are encouraged to consider external, systemic influences of their students' presentations, including racial discrimination, access to resources, socioeconomic difficulties, and social concerns related to poverty (Atkinson, Thompson, & Grant, 1993). For example, a 14-year-old African American female who lives with her maternal grandmother presented to an African American female school counselor through a teacher's referral for classroom behavioral problems including frequent outbursts and disinterest.* A school psychologist administered a series of achievement tests, including the Wide Range Achievement Test–3, wherein the student struggled to read words longer than four letters and perform mathematical operations entailing long division and converting fractions to decimals. When presented with this information, the school counselor hypothesized that the student may be illiterate and had been tacitly promoted through ninth grade without adequate attention to her academic needs. Initially, the school counselor conceptualized the student' difficulties as stemming from a learning disability, attention deficit/hyperactivity disorder, and other intrapsychic concerns that resulted in both classroom misbehavior and

* Example was adapted from a colleague's recent experience.

shame regarding her literacy struggles. Upon later reflection, the school counselor acknowledged that stereotyped assumptions of unruly classroom behavior and poor academic performance, inadequate access to early psychological assessment, and limited school and familial resources to supplemental services may be external forces that influenced how the student's needs were not identified. Furthermore, the school counselor reflected on her biases based on her social-class identity, in which she assumed that all students have access to equitable attention regarding their academic challenges and that this young woman's struggles were a function of her and her family's difficulties. In processing her reflections in peer supervision, she realized that her biases might compromise her conceptualization of her client's concerns and treatment options that would be commensurate to more inclusive conceptualizations.

Career Considerations

Multiculturally competent school counselors employ lenses that acknowledge the conjoined influences of intrapsychic and external forces on career development in various student populations. In recognizing the concomitant forces of cultural values, racism and discrimination, and inequitable access to resources alongside positive factors, such as coping self-efficacy, racial socialization, and resilience, school counselors can play a vital role in promoting higher academic achievement among all students and foster opportunities for greater representation of people of color in the workforce (Constantine & Blackmon, 2002; Constantine, Wallace, & Kindaichi, 2005; Sciarra, 2001). Although all students may experience career exploration and other career development issues at different paces, some students of color may perceive additional career and educational barriers that might inhibit their career exploration (Ladany et al., 1997). For example, Constantine et al. (2005) found that perceptions of occupational barriers were positively predictive of career indecision among African American adolescents. Conversely, however, Evans and Herr (1994) found that perceptions of neither racial nor gender discrimination were significantly related to the career aspirations of Black college students. Additionally, Rollins (2001) found that African American adolescents who perceived greater racial discrimination toward themselves reported greater career decision-making self-efficacy. It appears that although some adolescents of color may internalize perceptions of educational and vocational barriers, others still possess high career goals and confidence in their abilities to pursue their goals successfully (Constantine et al., 2005).

Constantine et al. (1998) encouraged school and career counselors who work with urban youth of color to address the potential conflict that may arise between wanting to succeed academically and vocationally and feelings of loyalty to their families and communities. It is critical for multiculturally competent school counselors to be cognizant of the multiple forces that can influence the career development of students of color and to differentiate between normative career development experiences and those that are of more critical psychological concern.

Multicultural Competencies for School Counselors

Although the literature on multicultural counseling competence has offered several training "best practices," it has been suggested that the field lacks a consistent and "comprehensive taxonomy of training objectives that describe cross-cultural competence" (Carey et al., 1990, p. 156). In summarizing recent literature that articulates specific competencies for multiculturally competent school counselors, it is possible that a sense of consistency and specificity can emerge among school-counseling training programs.

Newer models of cultural competence for school counselors draw from the tripartite model of multicultural counseling (Sue, Arredondo, & McDavis, 1992), while providing specific suggestions regarding school characteristics and areas of intervention (e.g., personal, career, or academic). For example, Lee (2005) articulated six competencies specific to school counselors who work in urban environments: (a) cultural competence (i.e., possessing awareness, knowledge, and skills appropriate to intervene responsibly with culturally diverse students and families); (b) skills for promoting empowerment (i.e., engaging youth to become empowered to address challenges implicit in urban contexts that can hamper their academic and vocational achievement); (c) taking a systemic perspective to counseling (i.e., acknowledging and integrating the multiple personal, familial, social, and societal influences on urban adolescent development in multifaceted interventions); (d) advocacy (i.e., implementing change on systemic levels to address inequitable barriers to student development); (e) collaboration (i.e., forming alliances with familial and community stakeholders in urban student education to promote educational development initiatives); and (f) leadership (i.e., active participation in school, district, and political initiatives that attend to the needs of urban students). Although these competencies were written specifically for counselors working in urban school environments, tenets such as employing a systemic perspective, collaborating with important others in the students' environments, and promoting empowerment and advocacy are applicable to school counselors who work with racially and ethnically diverse students across environments.

Specific competencies for multicultural career counseling also have been presented in the literature. Constantine

et al. (1998) encouraged counselors to be aware of how cultural (e.g., acculturation, ethnic and racial identity, and cultural values), familial (e.g., parental education attainment), and environmental (exposure to poverty, violence, and crime) factors may contribute to urban youths' perception of attainable careers. Using this awareness, counselors may identify and employ interventions designed to foster the pursuit of career-related information and increase students' knowledge of the qualifications needed to succeed in their career choices. Additionally, counselors can assist students of color to identify occupational role models from their racial and ethnic group and/or in their communities and encourage adolescents of color to address potential barriers (e.g., financial, sociocultural, and systemic) to their career aspirations (Constantine et al., 2005). Moreover, counselors should be skilled in determining the degree to which the career development struggles of adolescents of color are developmentally appropriate, related to their perceptions of career barriers or having limited career-related information, or a combination of multiple psychological, environmental, and structural factors (Ladany et al., 1997). Counselors could collaborate with teachers and school administrators to foster coping and resilience strategies to help adolescents of color address discrimination, racism, and prejudice as they pursue their career goals and to encourage the integration of vocational information and themes within school curricula. For example, school counselors could offer teachers workshops that address such issues as working with culturally diverse student populations, addressing diverse learning styles, understanding cultural influences on learning, and addressing racism. Additionally, counselors could liaise with local business leaders to provide work apprenticeships and/or meaningful part-time jobs that may influence the career development of adolescents of color. Moreover, counselors might want to engage the support of community and political organizations that address the myriad societal barriers that may impact the career development of youth of color.

In the aforementioned competencies for multicultural school counseling and career counseling, the theme of advocacy is brought into relief. According to the American School Counselor Association (ASCA; 2003) *National Model*, school counselors' advocacy efforts are designed to help counselors eliminate barriers to students' development; foster opportunities for all students to learn; ensure equitable access to quality education; collaborate with important others outside of the school body to help meet students' needs; and promote systemic change. School counselors may advocate for students and families and particular groups of students within the school body; additionally, school counselors may advocate for better school counseling programs and resources and for the visibility of the school counseling profession on local, state, regional, and national levels (Kiselica & Robinson, 2001). Trusty and Brown (2005) presented three general advocacy competencies for school counselors: *dispositions*, which include advocacy (i.e., autonomous and altruistic motivation to take risks in helping students meet their needs), family support/empowerment (i.e., recognizing that parents and guardians are often the primary advocates for students), social advocacy (i.e., addressing inequities and barriers affecting all people), and ethical (i.e., valuing professional codes of ethics); *knowledge*, which includes knowledge of resources, parameters (e.g., school regulations, rights of families and individuals, and scope of their practice), dispute resolution mechanisms (e.g., mediation), advocacy models, and systems change; and *skills*, which include those regarding communication (e.g., listening and empathy), collaboration (e.g., joining families and administration in advocacy efforts), problem assessment and problem solving, organization, and self care.

Advocacy competencies are intrinsic to school counselors' multicultural counseling competence and to changing roles of school counselors given the changing needs of the diverse school population. For example, school counselors working with students of color need to enact their knowledge and awareness of diverse familial and cultural values to join and collaborate effectively in advocacy efforts. Moreover, school counselors' mediation between parental bodies and school administration might entail employing awareness of how the role of school as a socialization agent in students' lives may differ by culture. Further, efforts to assess and address problems may entail culturally relevant intervention mechanisms, including involving external, family/community-based important others as mediators or group cofacilitators. Lee (2001) noted that school counselors should advocate and become voices for students who have been disenfranchised historically by the educational system, especially students of color and students from low socioeconomic backgrounds.

Multiculturally competent school counselors also could advocate for the needs of their profession regarding increased multicultural training. For example, advocacy efforts may be directed toward encouraging ASCA to state explicitly its intention with regard to servicing the needs of linguistically and culturally diverse students (Williams & Butler, 2003). Furthermore, school counselors and professionals devoted to the needs of school counselors and students of color may encourage the Council for Accreditation of Counseling and Related Educational Programs (CACREP) to institute explicit guidelines that encourage training programs to infuse multicultural training beyond the one-course method (First, 1988). Doing so may promote the multicultural competence of future school counselors and address the needs of the increasingly diverse student population in a much more effective manner.

Best Practices in School Counseling: Promoting Multicultural Issues in Schools

Culturally diverse school-aged children whose emotional, social, and behavioral concerns are not addressed sufficiently may experience diminished opportunities to learn and grow in school environments (Rones & Hoagwood, 2000). School counselors are in vital positions to help eliminate or reduce the impact of barriers that keep children of color from achieving academically in school systems (Butler, 2003). The needs of children of color must be addressed in ways that consider the complex milieus in which they live. For example, it is important to note that some school-aged children may come from home settings in which poverty, interpersonal violence, or even substance abuse may be prevalent. These types of circumstances may make it challenging at best for some children to attend sufficiently to academic endeavors. Differences between the home and school environments of children of color, particularly in urban settings, must be considered in the context of identifying culturally appropriate interventions for these students (Patton & Day-Vines, 2004). Moreover, school counselors' identification and implementation of enrichment initiatives geared toward promoting the academic achievement of student populations affected by achievement gaps would be helpful (Yowell & Gordon, 1996).

Many school counselors may over rely on individual counseling interventions in working with children of color. Such interventions not only lack research data and accountability with regard to outcomes in school settings (Eschenauer & Chen-Hayes, 2005; Whiston, 2003), but also may not consider how the cultural values of these students might not be congruent with the use of such interventions. Because accountability and cultural sensitivity are particularly important issues in many school districts, the use of individual counseling interventions, absent data regarding their efficacy and cultural appropriateness in school settings, may be both ineffective and inappropriate (Burnham & Johnson, 2000).

It also is crucial that school counselors identify an array of interventions with students of color that focus not only on responding to existing problems or issues, but also on the prevention of mental health issues or concerns that could arise in school environments (Holcomb-McCoy & Mitchell, 2005). Programming and small-group discussions on topics such as body image, self-esteem, peer pressure, and social skills could be instituted prior to an age in which school-aged children of color begin to be concerned more specifically about these issues. In addition, vocational guidance and career interventions, beginning as early as elementary school, would seem important in underscoring the salience of career exploration and development at a relatively young age.

School systems and districts also should consider ways to promote the recruitment, hiring, and retention of qualified counselors that, to some degree, reflect aspects of the student populations with which they work. For instance, it may be difficult for some students of color to consider seeing a White school counselor to address deeply personal issues. Because some students of color experience cultural mistrust attitudes toward Whites generally, such attitudes may play a role in their willingness to seek help from a counselor who is racially or ethnically different. The opportunities for students of color to seek school counseling services from a culturally similar counselor might help these students to seek such services more deliberately.

School counselors increasingly are being challenged to become social justice advocates in school systems, particularly with regard to ensuring that all students, regardless of cultural background or socioeconomic status, have the chance to achieve to their greatest potential (Lee, 2005). Thus, school counselors should be leaders in the context of their school environments in terms of ensuring a milieu that actively promotes multiculturalism and antidiscrimination so that students of color do not have to be exposed to attitudes and behaviors that might circumvent their opportunities for academic, personal, and social successes. Setting up a multicultural task force comprising students, teachers, administrators, parents, and other community members might be effective in ensuring relatively system-wide support for multicultural initiatives. In addition, programs that address the strengths and assets of an inclusive and multicultural environment might be helpful in educating both students and teachers about the importance and necessity of cultural diversity. School counselors also are in a unique position to support a diverse student body by (a) examining school policies and practices as well as student activities to ensure equity and access among the student body, (b) encouraging teachers to explore issues of diversity in the context of the courses that are offered, (c) acting as an advocate for students who possess limited English proficiency, and (d) advocating for equal access in educational attainment and course-taking opportunities for all students (Stone & Dahir, 2006).

XXIII
CONSULTATION WITH TEACHERS, ADMINISTRATORS, AND COUNSELING AGENCIES

ROBERTO CLEMENTE
Roosevelt University, Chicago

Introduction

The daily routines of school counselors reflect the complexities of an ever evolving and multifaceted society. The stereotypical perception of a school counselor sitting passively behind a desk, providing career advice or counseling students one-on-one, is a mirage of the past. It is no secret that our society is experiencing drastic changes and is facing a severe crisis in most sectors; this is supported by both anecdotal and empirical evidence (Lockhart & Keys, 1998; Luongo, 2000). Our students cannot be isolated from the severe stress found in our society and cannot function in a vacuum. National data on poverty, joblessness, divorce rates, substance abuse, violence, sexual abuse and homelessness are all evidence of a convoluted society in search of answers. As an illustration, there are more than 5 million children with special educational needs receiving some type of services in our schools (Albert, Brown, & Flanigan, 2003) approximately one third of the student population is taking some type of psychotropic medication for attention deficit disorders, anxiety, depression, or other types of mental health conditions (Nastasi, Bernstein-Moore, & Varjas, 2004), the suicide rate among school-aged children has risen substantially, and the unintended pregnancy rate among adolescents remains a challenge although some steady progress has been achieved in this area.

To make matters more complicated, who can forget the horrific images displayed on television during the Columbine High School shootings or more recently, the events in which a teen gunman carried out a deadly killing spree at Red Lake High School in Minnesota? The level of violence in our schools has increased to the point that we are facing one of the most severe challenges in the history of our educational system. School shootings perpetrated by disgruntled and disenfranchised students living on the outskirts of the school cultures are a unique American phenomenon that has education experts scrambling for answers. On top of all the new challenges encountered by school counselors and students, the nature of the concerns and challenges brought by the students is testing the professional flexibility and adaptability of today's counselors.

Another example of the increased challenges to school counselors is responding to behavior that was once socially acceptable, but may now be the precursor of severe negative behaviors accompanied by potential lawsuits against the school or district, as in the case of bullying. Today's school counselors have to be well versed in areas such as law, educational policies, state mandates, and health policies in addition to the expected traditional areas (e.g., career, individual and group counseling, classroom guidance) as addressed in their training programs. This list of challenges also includes increased focus on the use of the school counselor to facilitate academic achievement among all students with a movement to increase the academic rigor of each student's program of study.

Each student who is on a school counselor's caseload presents challenges that are complex and can be a challenge to develop an effective plan of action. Consider Case Vignette 23.1. This vignette exemplifies a challenging situation that is becoming more the norm than the exception and forces school counselors to draw on their knowledge and experience as well as increase their need to seek and

CASE VIGNETTE 23.1: HECTOR—LACK OF MOTIVATION IN CLASS

The homeroom teacher has referred Hector, a 10th-grade Latino student, to the school counselor because he seems to be unmotivated, does not participate in class, and most of his homework in other classes is either incomplete or not completed at all. Occasionally, he falls asleep and lacks physical energy. The teachers suspect that Hector may be experimenting with drugs or alcohol. After a thorough interview with Hector and his mother, the counselor realizes that Hector has been working two part-time jobs to help supplement the family income. Since he is the oldest child and has four siblings, it is expected that he must contribute. The family's sole other income is his mother's. His father is a chronic alcoholic who abuses the children and his wife constantly. His mother is encouraging Hector to leave school and work full-time.

Questions for Analysis:

1. As a counselor, what issues would take precedence and why?
2. How would you "calm down" the teachers without violating confidentiality?
3. What are the cultural issues?
4. How can you reconcile the consultation and counselors' roles?
5. How important are the cultural variables?
6. If you are not proficient in the Latino culture, how can you demonstrate sensitivity and imple ment a plan of action that addresses Hector's needs?

provide consultation. In this case, the poor academic performance is only a symptom of the real problem.

This chapter provides an operational definition of the consultation concept as it represents a shift in paradigm for counselors as well as several modes of consultation. It also provides a series of theoretical approaches and practical approaches to the process of consultation. Furthermore, it presents a generic consultation model along with challenging areas accompanied by basic communication strategies to ameliorate those difficulties. Finally, the differences between client- and group-focused consultation are discussed along with suggested areas of research and future directions.

Consultation as Part of a Developmental–Comprehensive School Counseling Program

In a developmental–comprehensive school counseling (DCSC) perspective, consultation becomes one of the program components. The traditional approach of working with students was based on providing services for those who requested them or those who were referred by teachers, school principals, or parents. In contrast, the DCSC program is based on a proactive platform for delivering sequential programming to all students (Ripley, Erford, Dahir, & Eschback, 2003). According to the American School Counselor Association's (ASCA) model, a DCSC has three interrelated components that are the foundation. These components are the delivery system, the management system, and accountability.

Within these three integral components, the following areas are targeted: systemic change, leadership, advocacy, collaboration, and leadership. All of the aforementioned are based on three key domains: academic, career, and personal/social development. Also, the Transforming School Counseling Initiative (TSCI) emphasizes the areas of equity, justice, and consultation as part of a strong DCSC program (Carey, 2003). In essence, consultation is not an optional skill or intervention but an instrumental strategic aspect of implementing and targeting some of the areas of a DCSC program.

Consultation: A Practical Definition

The term *consultation* is informally used among friends, coworkers, and even family members. In essence, *consultation* implies sharing advice or information when there is a lack of knowledge or uncertainty about making a decision. The professional literature provides multiple definitions that have common traits that will vary slightly depending on the focus given (Brown, Pryzwansky, & Schulte, 2001; Friend & Cook, 1992; Gallessich, 1982; Gutkin, 1999; Parsons, 1996; Parsons & Kahn, 2005). For example, when a student is trying to choose between several postcollege opportunities and seeks perspective from peers, family members, or the school counselor, the student is seeking consultation. If the same student is struggling with his or her anxiety about the situation or understanding the pres-

sure he or she is getting from parents to make a particular decision, the student is seeking counseling.

Fundamentally, consultation is a voluntary relationship of a triadic nature (Gutkin, 1999) and involves a consultant or provider of help (e.g., a school counselor; Friend & Cook, 1992), who will work with a person/group or help seeker (consultee) in order to benefit a client (e.g., student). School-based consultation is unique because of the context in which it occurs. Several variables will determine the outcome and direction of the consultation process, for instance, the intensity of the problem or issue, the competence and qualifications of the consultee to solve the situation, and who initiates the consultation process. It is common for the consultee to initiate the consultation process; however, it is not unlikely for the consultant to initiate it by being proactive instead of reactive, particularly within a school setting where the consultant may have responsibilities concerning the consultee's choices (Parsons & Kahn, 2005).

Problem–Solution Orientation

An effective way in which to sustain the boundaries of the triadic nature of consultation is for the school counselor (consultant) to keep a problem-solution orientation toward the resolution of the client's situation as opposed to focusing on the consultee's needs. Consider Case Vignette 23.2, which provides an illustration in which the boundaries of the consultant and consultee can be easily transgressed due to role confusion. That is, the consultee expects that the consultant will serve as a personal counselor to deal with her emotional issues.

Although it may seem simple, maintaining the role of a consultant and focusing on the original tasks that often start the conversation, can be somewhat difficult. It is not atypical for consultees to explore the possibility of getting counseling by the consultant. This can be dealt with by keeping in mind the original purpose of the triadic relationship and the problem-solution orientation that will ultimately benefit the client(s). However, if the consultant believes that the consultee could benefit from personal counseling, then the consultee may be referred to another mental health professional who can assist her in dealing with those personal issues. As a word of clarification, this particular problem-solution orientation is based on a triadic relationship, and then the previous example emphasizes the client as a beneficiary via the assistance of the consultee. Therefore, this does not imply that at some point and by utilizing other types of services the school counselor cannot provide direct services. Thus, these are not rigid processes, modes, orientations, or models that cannot change as the interactive dynamics evolve. The best strategy to deal with the uncertainty of whether the consultant is providing consulting services or counseling services to the consultee is by having a pictorial characterization of both processes as illustrated in Figure 23.1 and Figure 23.2.

Modes of Consultation

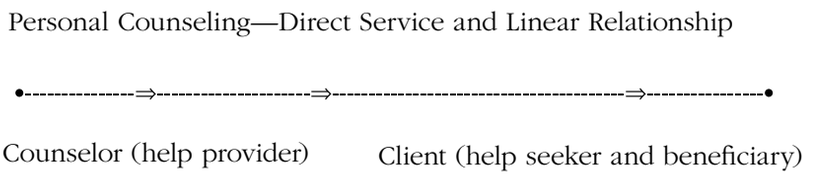
Since consultation is practiced in different contexts and areas of the counseling profession (e.g., community, agencies, industry, and schools) and is an essential part of

CASE VIGNETTE 23.2: BETTY'S ROLE CONFUSION

Betty is a third-grade teacher and is extremely angry and disturbed after seeing sexual abuse signs displayed by Katisha who is in her class. She contacted the father and after a short dialogue "concluded" that he was the perpetrator. As a result, she engaged Katisha's dad in a very nasty argument. After she calmed down and the parent left the classroom, she consulted with the school counselor and concluded that she might have overreacted. By Betsy's own admission, she was sexually molested by her uncle when she was young and was carrying a lot of anger and probably misplaced it against Katisha's dad without having proof that he was the perpetrator. Betsy is asking for professional help by the counselor in order to deal with her own issues.

Questions for Analysis:

1. What would be your first reaction when dealing with Betty's outbursts of misplaced anger?
2. How would you balance the delicate role of consultant/counselor?
3. What are the possible ethical and legal issues involved?
4. How would you report the sexual abuse case to the proper authorities and agencies?



Personal Counseling—Direct Service and Linear Relationship
Counselor (help provider)
Client (help seeker and beneficiary)

Figure 23.1 These diagrams serve as a pictorial depiction of the differences between the processes and not the exclusion of direct services over consultation (Parsons, 1996).

other disciplines (e.g., engineering, marketing/finances, and medicine), there are many different forms that consultation can take. Most importantly, like any of the other modalities (e.g., individual, group, and family counseling), consultation is guided by a theoretical conceptualization. Furthermore, consultants will operate based on their views, concerns, problems, or issues; how these must be resolved; what the expected outcomes are; and how soon results must be obtained. This section provides a short overview of some modes of consultation based on assumptions of the complexity of the problem, its focus, and styles of implementation.

Behavioral Consultation

The pillar of behavioral consultation is the social learning theory that stresses observable behaviors displayed by the consultee and the client (Bergan & Kratochwill, 1990; Martens, 1993). It stresses that the environment influences the individual's learning process and the way he or she functions on a daily basis. Strategies such as modeling, self-management, monitoring, reshaping, and social modeling are typical interventions drawn from both behavioral and social learning theories. Like a behavioral counselor, behavioral consultants adopt a directive, generally authoritative position when monitoring and assisting their consultees. They are actively involved in the data-gathering process or can use the consultee as a source to collect the necessary information for evaluation and intervention planning.

Client-Focused Consultation

The client-focused consultation approach is perhaps the most popular and common type of consultative interventions. It is typically used with teachers, administrators, parents, and individuals from the community when they need advice and guidance on how to help their students. The ultimate goal of the client-focused consultation is to look for a change in the behavior of an individual client. The typical methods utilized to promote these changes are field observations, individual interviews, and paper-and-pencil instruments of evaluation or testing. The main focus of the process is the client and not the consultee or group of the client.

Crisis-Oriented Consultation

When school counselors are consulted by an individual or group to provide advice or shed light on an issue, it is very likely that at that point a high degree of dysfunctionality is present and very likely that discomfort and hurt are felt. Using the metaphor of a mental health condition and the severity of its symptoms, the consultant has to determine the swiftness of the consultation process to quickly bring back the original degree of stability to the system (Sheridan, Bergan, & Kratochwill, 1996). For example, Mrs. Hanson is extremely frustrated with Eddie's behavioral outbursts in the classroom; likewise the school principal has tried several methods of disciplinary actions without success. Because there is no school counselor appointed in

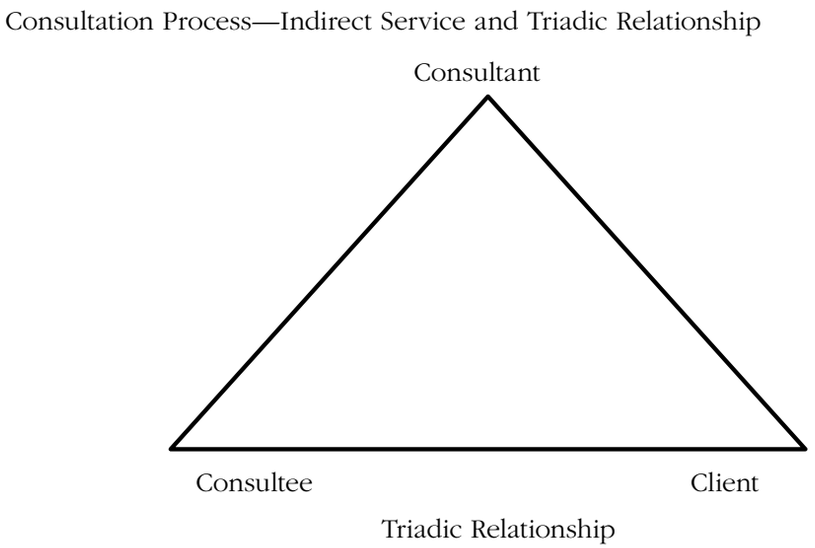


Figure 23.2 A triadic relationship places the emphasis on the client as the ultimate beneficiary of the consultation process (Parsons, 1996).

the school, they have brought in a part-time school counselor as a consultant to deal with cases such as Eddie's. Obviously, the main goal of the consultant is to improve Eddie's interpersonal skills, self-monitoring skills, and social behavior. The main point is to restore the quality of the teaching environment in the school, increase Eddie's school performance, decrease Mrs. Hanson's stress and the school principal's preoccupation about an unstable school atmosphere. Due to the triadic nature of this situation, the consultant will be targeting the teacher, school principal and student. All of them need to change in order to reestablish the precrisis level of the school environment. In essence, the consultant will touch upon the three points of the consultation triangle.

Consultee-Focused Consultation

This consultation approach focuses on assisting the consultee by providing the necessary skills or tools that will eventually help him or her provide better services to the client. To be exact, the consultee is the provider of the services and is being instructed or coached on areas that need improvement. In spite of the fact that the focus of this approach is the consultee, the client will reap benefits as a result of the consultative interventions (Brigman, Mullis, Webb, & White, 2004). By obtaining some additional training, the provider (consultee) is better equipped to assist the client. Again, the consultant is investing his time and energy on the consultee with the expectation that the consultee will provide better services to the client. For example, Jamie, a 5th-grade teacher, lacks a knowledge base of attention deficit disorders and its implications; she would like to "reach" Kennie, who has been diagnosed with ADD. The consultant can provide Jamie with information and specific classroom intervention strategies to assist her in being more effective in teaching Kennie. For instance, the consultant (counselor) can obtain Jamie's evaluation records and establish recommendations on: (a) follow up of psychotropic medication monitoring in conjunction with the parents and school nurse, (b) eating habits, (c) distraction elements, (d) breaks or relaxation periods between activities, (e) seating arrangements in the classroom, and (f) exploiting strengths to compensate for deficiencies.

Mental Health–Focused Consultation

In many ways the mental health–focused consultation is a more elaborated and extensive version of the client-focused approach. The consultant is seen as a teacher who delivers information but does so in a collaborative fashion with strong democratic principles. G. Caplan and R. Caplan (1993) saw this approach as a coordinated effort between the consultant and the consultee. G. Caplan and R. Caplan considered the relationship as an egalitarian negotiation in which the consultant does not claim to be an expert who imposes his or her views about how a problem must be approached and solved, but rather an individual who offers a different point of view and coordinates the resolution efforts. As a way of illustration, a mental health agency is struggling with a new influx of Bosnian immigrants who have received refugee status and are being integrated in the community. Many of them are facing issues related to postwar trauma and posttraumatic stress disorders. They are puzzled by their symptoms but unsure how to contextualize their realities in the U.S. context. A mental health consultant with expertise in refugees is hired not only to provide information to the staff, but to explore issues related to cross-cultural concerns that are having a negative impact on developing effective programs.

Developmental-Focused Consultation

In contrast to other types of consultation such as crisis-focused consultation, developmental-focused consultation is initiated by the consultant (counselor) and not the consultee. Instead of looking at what currently is not working, consultants will offer their services even when there are no difficulties in the areas of delivery services, clientele, or staff. This approach adopts a preventative perspective angle that looks at maintaining and improving current services. For instance, James, an experienced school counselor, learns that in the next two years the main factory in town will start downsizing to reduce the cost of operation. He knows that it will mean changes in the family structure of many of the students at the school, and therefore, the teachers must be prepared to deal with issues related to unemployment such as divorce, substance abuse, and domestic violence. James has offered a series of workshops to help teachers deal with this upcoming reality. The emphasis is on prevention as opposed to remediation.

Collaborative-Focused Consultation

Collaboration implies sharing, that is, allocating the resources to solve a situation. In this model, the consultant and consultee are actively giving out the best of their knowledge in a partnership in order to resolve a challenge. They not only share and combine resources, but also are responsible for the outcome. Therefore, the consultant and the consultee work as partners (Kurpius & Faqua, 1993). By using this approach, the probability of success increases substantially. For instance, let's use the previous case in which James, the school counselor, is expecting serious changes in the school environment as a result of the factory's closing. Despite the fact that he is an

CASE VIGNETTE 23.3: MR. PETERSEN AND PAPO

Reason for Referral

Papo was referred to you by Mr. Petersen, a seventh-grade teacher. According to Mr. Petersen, Papo has serious disciplinary problems in his class. He describes Papo as extremely disruptive, anxious, attention seeking, loud, and cocky. Mr. Petersen indicates that he is always late and comes with "lame" excuses to justify his tardiness. He describes Papo as the class clown but also believes that he seems to be involved in some type of gang activities because he is always hanging out with older kids who wear distinctive colors and make certain hand signs at school.

Mr. Petersen—The Consultee

Mr. Petersen accepted a teaching appointment at a middle school in the South Bronx last year as a result of a giveback-to-America program designed to appoint teachers to inner-city schools with a forgivable student loan program as an incentive. This is Mr. Petersen's first teaching appointment since his graduation last year from a university in Iowa. Mr. Petersen comes from a traditional farm town in Iowa with a population of 1,500 people, mostly of Swedish descent. He had never visited New York or the East coast prior to this teaching appointment. He thought that teaching a couple of years in a different part of the country would give him the opportunity to see other places in addition to the financial benefit of not having to pay back his student loans. At this point, he feels frustrated by Papo's situation because he was taught that a good teacher does not need a school counselor or social worker to deal with classroom disciplinary problems.

Papo—The Client

Papo is a fourth-generation Puerto Rican–American from the South Bronx, New York. He is currently living with his paternal grandparents. Prior to this, he lived with his uncle, mother, and maternal grandparents. He is the youngest of three siblings; one of them is living with another relative and the older one was sent to Puerto Rico. His dad is currently serving time in the state penitentiary for armed robbery, and his mother lost custody of the children due to physical abuse. In spite of the difficult family picture, Papo keeps a 2.80 G.P.A. and has not had serious disciplinary difficulties in the past.

The Context—School

The middle school (seventh to ninth grades), located in the South Bronx, has a population of 1,500 students, 60 classroom teachers, four school counselors, one school psychologist, one school administrator, and three assistant administrators. Ninety-five percent of the student body is eligible for either free or reduced lunch. The majority of the students are African American, Puerto Rican, and Dominican. Only one percent of the students are European American. According to the school district, the school has achieved some progress during the last academic year; however, the school remains under academic probation due to its low scores on the state tests. This came as a result of the No Child Left Behind mandate and its achievement standards. There is a high level of tension among the staff and a certain degree of discontent due to the lack of funding provided by the federal government to achieve these goals.

CASE VIGNETTE 23.3: MR. PETERSEN AND PAPO (continued)

Questions for Analysis and Application:

1. Conceptualize this case based on the following consultation modes:
   a. Behavioral Consultation:
   b. Client-Focused Consultation:
   c. Crisis-Oriented Consultation:
   d. Consultee-Focused Consultation:
   e. Mental Health Consultation:
   f. Developmental-Focused Consultation:
   g. Collaborative-Focused Consultation:
   h. System-Focused Consultation:
2. According to the case and based on your conceptualization, which consultation mode is most effective? Elaborate.
3. What are the major issues to be considered as a consultant?

experienced school counselor, he lacks knowledge about the aftermath of downsizing a company and its effects in an area's schools. He decides to seek consultation from Jackie, an experienced school counselor from a neighboring town that experienced the same situation eight years ago. James and Jackie shared experiences and put them together to create a plan of action. In reality, both were equally involved in the process and shared the workload in order to devise a proactive intervention.

System-Focused Consultation

This mode of consultation attempts to target various components or subsystems of an organization to bring collective awareness of how to resolve a conflict or a problem. The consultant works directly with those involved in the system to assist them in identifying the areas that are creating the current conditions (McDaniel, Campbell, Wynne, & Weber, 1986). The consultant will assist those involved in the system to conceptualize the current situation from a different angle and see how all participants can work together to achieve a "new system." From an organizational standpoint, many times the members of a system reflect the structural dynamics of the organization itself; that is, if the organization is extremely rigid, bureaucratic, and hierarchical, the members will feel alienated from those in power. Typically, a sense of detachment and a lack of collective responsibility surface, which creates oppositional behaviors among employees. By nature, systems try to maintain their homeostasis (balance) and will inevitably resist change. If a consultant is conducting an evaluation of the system, this may be seen as a threat to the current balance of the organization. As a result, it is not atypical for consultants to deal with high levels of resistance (Kuh, 1993). Consider the previous case in which James, the school counselor, is trying to be proactive by utilizing a systemic mode of consultation.

James is aware that many of the faculty and administrators will be resistant to change in their current daily routines unless they are involved in the process. In order to ameliorate their opposition and gain their support, he creates a consultation committee in which members of the faculty, administration, and parents work in conjunction with him and outside consultants. The strategy is to validate the concerns of all the subsystems in the school and obtain their support once proactive measures are recommended and implemented. The chance of successful consultation process will increase by considering all the elements of the system.

Phases in the Consultation Process

Regardless of the mode of consultation, there appear to be phases in each consultation. Depending on the consultative style, theoretical orientation of the consultant, and nature of the consultation, there will be variations in the sequencing and pacing of the phases in each consultation and some phases may not be present at all. Occasionally, the consultant will invest a lot of time on one phase and barely any on another. However, the following overview of the consultation phases serves as a guiding map that provides direction, structure, and order of action for any school consultant.

Consultation mimics the counseling process in many ways but most specifically mirrors the uncertainty of the outcome and the fluidity of the action process. It is important to clarify that despite the fact that the phases of consultation are presented in a linear fashion, they are not always experienced in this way, and at times some of these phases seem to be more ambiguous and unpredictable than others.

Preentry

This phase of consultation is critical because it sets the stage for all the participants. Similar to group counseling, the preentry phase serves for the consultant to explore the existing norms of the institution. It is vital for the school counselor (consultant) to explore the views or opinions that the administrators and teachers hold toward the school counselor with regard to referral procedures, expectations, and outcomes. As an illustration, Mr. Parker refers "trouble students" to Mrs. Atkinson (the school counselor) and expects her to be able to evaluate and "fix" them in a couple of days. This is the traditional way of interaction with school counselors as consultants; teachers or administrators refer students and then remove themselves from the remaining process expecting the school counselor to resolve the situation or give them quick advice.

To avoid this antiquated dynamic, the school counselor must redesign the traditions and norms of the school with regard to the consultation process. That is, teachers and administrators must take an active role during the consultation process and remain active throughout its resolution by providing feedback to the consultant, keeping the communication channels open, and incorporating the input of the consultant. The best way to change the perception and expectations of the school staff with regard to the duties of the school counselor as a consultant is to demystify those ingrained beliefs. This can be achieved by using a predetermined period of time during in-service activities at school to explain the process of consultation and counseling to the staff and by clarifying that this is not an individual process but a concerted effort from all the staff. These concepts can be introduced by making available a conceptualization diagram of a DCSC and all its respective components. Familiarizing the school staff with these concepts will facilitate their involvement in the consultation process.

Entry

Similar to individual counseling, the first meeting will set the stage for success or failure in the consultation process. The focal point of the very first meeting will be based upon the crisis level brought by the consultee or the intensity of the situation. For example, Katherine, a 28-year-old parent, has been struggling with her daughter's apathy toward school and has resorted to contacting the counselor for assistance after trying ideas of her own. It is obvious that Katherine is frustrated, angry, and discouraged at the point of contact with the counselor. As a result, Katherine may be looking for a quick fix and not necessarily for active collaboration with the counselor. It may be necessary for the school counselor to take remedial direct action for a short period of time until some degree of stability is brought to the situation.

When a consultee is in a state of crisis, collaborative partnership will not be a priority, but rather the expectation will be for the consultant to devise a "magic" plan for prompt resolution with minimal assistance from the consultee. It is indispensable, especially during the first session, to demonstrate empathy through the power of listening. The following are some key points for the consultation process during the entry phase:

1. Use basic listening skills; let the consultee finish the whole story.
2. Be empathic.
3. After dealing with the emotive part of the process, establish the logistics of the process, such as where to meet, what is needed for the next meeting, expectations, and collaborative goals.
4. As in individual counseling, the professional code of ethics must be applied, especially the issue of confidentiality and its exception (i.e., duty to warn). That is, if the consultee or client are in danger or will harm him- or herself, the consultant is obligated to report it to the respective authorities.
5. Create a written contract if necessary. Sometimes a written document provides some degree of accountability.

Exploration

Whether the consultation is formal or informal, this is the phase in which the school consultant collects data in the form of verbal reports and observations or documents and paper-and-pencil instruments. The school consultant must adopt the attitude of a field researcher in which all possible sources of information are investigated. As in counseling, at first the school consultant has to rely on the version and perspective of the consultee. At this point, the school consultant may be considering whether the description of past events is accurate or if the perception of the consultee needs to be corroborated due to a lack of consistency. Consequently, trust is an important element at this phase. The following points must be considered during this phase:

1. Explore what efforts and strategies have been tried to resolve the problem in the past. Which did not work and which were partially successful?
2. In a nonjudgmental way, explore the "filter" of the consultee, moreover, whether traumatic experiences, current mental health conditions, or severe biases are altering the perception of a situation.
3. Gather information about the client via documents, observations, or instruments to help answer the following questions: "What is occurring at this moment? Previously? Or, if the situation is not corrected, what will happen in the near future? What could be the potential consequences if the pattern is not altered?
4. Explore if there are systemic variables influencing the current or past situations of the client.
5. Rank, in order of importance, the series of problems (challenges) that may be causing the client(s) to behave in a particular way.

Setting Concrete Goals, Objectives, and Carrying Them Out

Once the school consultant has gathered a series of preliminary explanations of the origin of the problem, then he or she is ready to answer the following question: "How can I help the client change, alleviate the consultee's current situation, and help the system evolve?" Most of the time, the primary goal is to find a way to help the client change to ameliorate the situation. However, occasionally, one has to refocus the consultation process toward altering the consultee or even the organizational structure of the system in order to provoke change in the client. Independent of the focus of the consultation, the ultimate goal is to provoke some type of change to create homeostasis (balance in the system).

Case Vignette 23.4 is an illustration of how concrete goals can be set.

CASE VIGNETTE 23.4: MRS. BOWER'S CONCERNS—SETTING CONCRETE GOALS

Mrs. Bowers—The Consultee

Mrs. Bowers, a twelfth-grade English teacher has been very concerned about the rumors in school regarding her intolerance toward African Americans students. According to her, everything started when Tyrone, an African American male, complained about the absence of notable African American authors in the class's reading list. She explained that the selection of books was predetermined by the school district and that she had very limited flexibility on the selection of new titles for the course. She consulted with the school counselor on how to find a solution for the situation.

Tyrone and parents—The Clients

Tyrone and several parents indicated that Mrs. Bowers is somewhat racist because she gives preference to all the European novels and 19th-century American classics without taking into account authors of color. Tyrone and a group of African American parents presented their complaints to the school principal and school counselor.

The School Counselor as Consultant—Setting Concrete Goals

The immediate goal of the consultee is "I want the rumors about my supposed racial intolerance to stop." In order to achieve this basic goal, the consultant (school counselor) explored alternative options regarding her curricular flexibility prior to setting up a meeting with the parents of the concerned students. The consultant came up with several alternatives that could provide curricular flexibility to the teacher without compromising the original academic guidelines. He recommended the utilization of more special reports, alternate projects, and films and videos in class addressing African American icons such as Dr. Martin Luther King, Rosa Parks, and Malcom X. These options were approved by the school principal and board and immediately a special meeting with the African American parents was scheduled to inform them of the curricular changes.

CASE VIGNETTE 23.4: MRS. BOWER'S CONCERNS—
SETTING CONCRETE GOALS (CONTINUED)

Questions for Reflection and Analysis:

1. How can Mrs. Bowers keep in touch with the African American parents and get feedback before similar issues get out of hand?
2. What other long-term goals should Mrs. Bowers be advised to keep in mind?
3. How can the consultant evaluate the effectiveness of the interventions?

Regardless of the angle or focus of the consultation, a set of manageable and realistic goals will lead the way to achieve concrete objectives. Occasionally, goals are mistaken for objectives but they are not the same. A goal is a general, positive statement intended to achieve an outcome (Midgley, 2002). These general goals take the form of broad declarations such as

1. I would like my son to be more responsible with his homework.
2. I wish that Casey could be on time for his biology class after the lunch break.
3. I would like Mr. Ramsunsen to be more organized as a teacher.
4. We (i.e., teachers, administrators, and school staff) would like the students and parents to embrace the idea implementing a uniform for all the students beginning the next academic year.

As evidenced by the aforementioned declarations, vagueness tends to be the central issue among all of them. At times goals acquire the form of wishful thinking but lack a directional force that would propel the consultee to execute them. Goals are stated in a positive fashion and not with a negative connotation (Midgley, 2002). On the other hand, objectives are a refined version of goals because they are the tangible proof that the goals have been achieved. The objectives will serve as a measure of accountability to determine the direction of the process (Matsumura, 2005). The key difference between goals and objectives is that the objectives operationalize the goals and make them concrete and achievable. Goals are not always achieved because they fall within the realm of wishful thinking, but objectives provide direction. For instance, the aforementioned goals can be converted into achievable objectives in the following manner:

1. To promote school responsibility and the completion of my son's homework, I will create a more enticing and quiet environment at home conducive to academic work. I will set up a desk, reading lamp, and quiet place for him to study at the same time every day. The TV, stereo, video games and other distractions will be turned off during the two hours of daily study. And, I will provide a series of rewards by stages (i.e., weekly, monthly, quarterly, midterm, semester) as incentives.
   a. Different from the initial *goal* (i.e., I would like…), these *objectives* have a measurable outcome in which the progress is monitored and can be evaluated or rectified if not effective.
2. I will provide positive encouragement to Casey every time he is on time for biology class. At first, the hall monitor will remind Casey to go for a drink of water and use the restroom five minutes before the bell rings. I will find strong motivators and encouragement factors and utilize them to help Casey with his tardiness.
   a. Unlike the initial goal of "I wish that…" these objectives concretize a vague idea into action.
3. I will send Mr. Ramsunsen to some time-management and organizational workshops provided by the school district. I will pair up Mr. Ramsunsen with Mrs. Jones as a mentor.
   a. Instead of desiring to have a more organized teacher in Mr. Ramsunsen, providing the training and educational tools will increase the chances that he will be more apt to change. Criticizing or providing vague feedback will not necessarily invoke change.
4. We will send monthly letters and provide a series of workshops informing parents of the benefits of implementing a school uniform. Students will be exposed to similar information through classroom guidance activities throughout the semester. Also, creating an environment of inclusiveness and cooperation, parents and students will have the opportunity to select the school logo and colors of the uniform.
   a. Instead of wishing that the parents and students could embrace the idea of a school uni-

form, the goals allow the conversion of a wish into the operationalization of an idea.

The process of operationalizing the goals will follow after these are clearly depicted. Implementation of action strategies needs to be a communal effort on the part of the consultant and consultee. After the interventions are implemented, the consultant and consultee must look at the objectives carefully to see whether or not the intervention strategies are on the right track. In sum, the objectives are not affirmative statements but ways on how to transform a vague idea into a manageable purpose.

Evaluation

Evaluation serves as a way to monitor the accomplishment of the initial goals and objectives. Monitoring change in the client serves as a function to determine if there is a need to alter the initial goals or objectives or if the interventions have to be modified. How does the school consultant know if the consultation process was successful? The following points serve as a measuring device:

1. The implementation strategies were achievable and manageable.
2. The "true" problem or the source of concern was effectively targeted.
3. The concrete goals for the system, consultee, and/or client were attainable.
4. All causes of resistance were identified during the consultation process and were dealt with effectively.

Termination

Ideally, the termination process must be mutual although this may not necessarily happen. Termination is not only a matter of reviewing the attainment of goals and objectives but also a way to provide the necessary tools of awareness and knowledge for the consultant to maintain the current conditions. In other words, to conclude the consult, the consultee should be able to

1. Keep the actions used during the consult to sustain progress;
2. Monitor change in the future; and
3. Find sources of support in the absence of the consultant.

In sum, the process of consultation is not a linear one in which all the phases are achieved and every part of the process can be clearly identified. On the other hand, knowledge of the phases of consultation is critical as it serves as a roadmap that provides direction and understanding of the whole process.

Research on Consultation

Effectiveness of Consultation

As in any other branch of the human services, measuring change and success as a result of consultative interventions is not an easy task. However, it is not only an option to know whether the interventions provoked some positive change but an ethical mandate established by the Code of Ethics and Standards of Practice (American Counseling Association, 1995, C.2.d). When compared with group, individual, and family counseling, the modality of consultation lacks solid research in the areas of efficacy (Parsons & Kahn, 2005). In order to increase the quality of consultative services rendered, it is necessary to increase the body of research and information (ACA, 1995, C.2.f).

One of the main concerns about consultative interventions is whether school consultants are using interventions that have some validity and can be empirically supported (Erchul, 1992). As previously mentioned, school districts operate under the assumption that empirical studies with strong statistical support are more valid than anecdotal experiences. Therefore, these are some recommendations when conducting a consultation project:

1. Write a strong rationale that supports the study.
2. Translate the problem or situation into a hypothesis.
3. Use a large pool of participants (when appropriate). If not available, compile the results of several individual case studies.
4. Extrapolate results with school documents and national statistics.
5. If being hired by another school district, collaborate with other school counselors who can serve as action researchers.
6. Do not discard any form of data (e.g., number of phone calls, e-mails, interviews) that can be later used as research.
7. Follow the district guidelines for publication and dissemination of research (e.g., human subjects' standards).
8. Present results at local, regional, and national school counseling conferences.

Consultation and research in the multicultural arena
Multiculturalism has produced substantial changes in the areas of counseling and psychology (i.e., direct services) and it is slowly bringing about modifications to the modality of consultation (Jackson & Hayes, 1993). Because cultures do not remain stagnant, the consultant's skills should evolve and develop accordingly. Understanding the culture and values of a system is a prerequisite of any successful

consultation and a sign of a consultant with updated skills (Hansen, Himes, & Meier, 1990).

According to Parsons (1996), it is the consultant's responsibility to increase his or her own cultural knowledge and develop skills that are consistent with the diverse cultural populations. Also, a more effective consultant should accomplish the following: (a) awareness of one's own culture and its influence, (b) awareness of the narrowness of a single mainstream perspective, (c) understanding and valuing an alternative worldview, and (d) employing culturally sensitive approaches to diagnosis and intervention (p. 233).

The consultation modality will remain productive and vibrant by embracing and infusing multiculturalism. Acknowledging the demographic changes of the nation is paramount in developing services that are consistent with the belief systems and cultures represented by those who will benefit in a consultation process (Worzbyt, O'Rourke, & Dandeneau, 2003).

Areas deserving research interest in the future As a result of sudden cultural and social changes experienced in our society, school counselors as consultants will have to keep abreast by reaching out and tapping into other resources in order to remain effective. The following are some areas that deserve more research:

1. *Gang-intervention programs.* Although there are myriad gang-intervention programs with an emphasis on intervention and prevention, there is limited research on the consultation process that goes along with such programs (Tabish & Orell, 1996). School counselors can serve an instrumental role as consultants when prevention programs sponsored by community agencies cannot fully reach into the school. Utilizing the knowledge, educational background, and insights of the school's culture may possibly increase the chances of success of these programs.
2. *Formal consultation with mental health and community agencies.* It is best practices for community counselors to have staff meetings in which clients' issues are discussed as a way to obtain input and feedback from the rest of the colleagues. Rarely are school counselors considered in such processes, and they are routinely seen as ancillary providers of basic information as opposed to equals and participants in a coordinated event (Caplan & Caplan, 1993; Parsons, 1996). Research is needed to see how the outcome of the consultation process would change if school counselors are seen as equal collaborators and invested participants.
3. *Internet, school counselors, and their consultation role.* School counselors are in the initial stages of realizing the potential of the Internet as a tool to facilitate consultation (see www.scan21st.com).
4. *The* No Child Left Behind *initiative.* Currently, there are no provisions in the original document regarding school counseling. This should be a red flag for counselor/educators and school counselors in the field as it reflects various trends: (a) a lack of knowledge of services rendered by school counselors by those who developed the document, (b) an invalidation of these services as secondary to the traditional disciplines, and (c) a lack of leadership and political involvement in developing educational policies that benefit the school-counseling profession. All of these deserve the attention of researchers. Long-term and data-driven studies in conjunction with qualitative investigations should help advance the school-counseling profession and make it more relevant to our current reality.

Practice

Communication Strategies

Regardless of the intuitive abilities of a consultant, communicating effectively remains at the core of any consult. Damage to a professional relationship is not atypical if the communication between the parties has not been clear, purposeful, and honest (Brown, Pryzwansky, & Schulte, 2001). The following is a short synopsis of some communication strategies that the consultant must be aware of when interacting with the consultee and the client.

Rapport is established when the consultant displays careful and reflective listening and is empathic toward the consultee (Brammer, 1994; Ivey, 1994). Rapport is established when there is a sense of mutual trust and comfort in the communication process as illustrated in the example below.

Consultee (Parent)—Mrs. Ali
Consultant (School Counselor)—Mrs. Pitch

Dialogue:

Mrs. Ali: Hello, Mrs. Pitch. I am here because some students are harassing my son Abdul for his beliefs, looks, etc. I am very concerned, upset, and scared at the same time for his safety.

Mrs. Pitch: You must be going through a difficult time as I can tell that you are a responsible and loving parent who is concerned about Abdul's well-being. I cannot fully understand what you are

going through because I am not Muslim, but I am a mother like you.

Mrs. Ali: Yes, you know how hard it is to hear other kids say that my son is a terrorist? It hurts a lot because we are a good Muslim family and we do not believe in violence. That's not the way Abdul has been raised. This situation is very difficult. I think that most kids and even some teachers do not know what the true Islam is.

Mrs. Pitch: First, I want to know how Abdul is coping with the situation and what kind of help he has. Second, I also want to know what kind of support your family is getting. Abdul is our responsibility and our school wants to foment a sensitive and embracing environment. You seem very hurt about this problem and I am concerned about you and your family.

Mrs. Ali: Thank you so much for being a good listener, you are the first person that I have talked to about this situation outside the family. You seem to understand what we are going through.

Mrs. Pitch: You are very welcome. I have some ideas on how to promote a more tolerant environment. I believe that some kids and parents are reacting like that because they lack information. I can certainly mediate some type of classroom guidance activities in which perhaps members of your mosque who do out-reach activities can visit us and provide information to the students and staff of the school. Then, I can do some follow up activities with regard to diversity and tolerance. What do you think?

Before engaging in a full process of consultation, Mrs. Pitch addressed the emotional needs of Mrs. Ali by validating her feelings of pain and insecurity. As in a counseling session, connecting with the client is the precursor of a successful outcome, thereby building rapport.

Persuasion is not the equivalent of manipulation. It can be defined as a motivational strategy based on positive encouragement, especially when the consultee is frustrated and unmotivated (Brigman, Mullis, Webb, & White, 2004). The following example illustrates a series of skills such as validation, persuasion, and advice giving.

Consultant (School Counselor)—Mrs. Robinson
Consultee (Teacher)—Mr. Byrd

Dialogue:

Mr. Byrd: I don't think that I was born to be a teacher. I don't have what it takes to do it. I feel that I am putting out fires all the time. I feel disorganized and never relaxed. It is taking a toll and even affecting my lectures, which are my only strength. I am going to quit… .

Mrs. Robinson: Based on your tone of voice and your whole demeanor I can tell that you are very affected by your situation. However, I commend you for coming to my office and seeking help. How long have you been teaching?

Mr. Byrd: This is my first year. It has been really rough.

Mrs. Robinson: I hear your struggle and I don't want to invalidate or minimize your experience but that's exactly how I felt during my first year as a teacher. I started as an English teacher and after seven years made the transition to school counseling. I was so close to throw my teaching degree out of the window and start a new career… .

Mr. Byrd: Really? You look so organized and comfortable with what you do that I would have never imagined that. I don't know if I can make it though.

Mrs. Robinson: If you allow me, this is what I see. I see a very talented and energetic teacher who cares about his students. And, I see a person that can make a difference, somebody who is invested and willing to work hard.

Mr. Byrd: Thanks, I appreciate it. I have not had feedback in a long time because Mrs. Carter (school principal) is too busy these days… .

Mrs. Robinson: Do you still want to give it a try if I give you some assistance?

Mr. Byrd: Sure.

Mrs. Robinson: It seems to me that organization and time distribution are the issues here and not a lack of talent. That's easy to correct. We just have to work on an organizational system.

Persuasion can be combined with advice giving and positive encouragement. Once the consultee is encouraged to alter a behavior or pursue a goal, then that can be followed with advice giving and more concrete instructions.

Informing. Because the consultation is a psychodidactic process, being a good listener is not enough. At some point, it is expected that the school consultant will provide information and deliver concrete details and ways of implementing ideas. The school consultant will play the role of a teacher during some stages of the consultation process (Schmidt, 2003).

Consultant (School Counselor)—Mrs. Ramírez
Consultee (Teacher)—Mr. Castro

Dialogue:

Mr. Smith: I am having a hard time motivating some Latinos in my senior class to follow through the

necessary steps to complete college applications, ACT/SAT forms, and college visits. They do not seem to be motivated at all.

Mrs. Ramírez: You seem pretty frustrated about it. What have you tried up to this point?

Mr. Smith: I have talked about the importance of a college degree in life, brought the brochures, and offered help to fill them out, etc… .

Mrs. Ramírez: I see. All of those are good strategies and perhaps we could enhance those to build up the motivation by using reverse psychology.

Mr. Smith: Uhm. Good idea. But how exactly can I do it?

Mrs. Ramírez: I can assist you with locating speakers from the community who are ex-convicts and ex-gang members, who have had a really rough time in life, and are giving back to the community by demystifying the idea that you can have it easy in our society without a college degree. These are very powerful guys who speak their language and are reliable. Once they start realizing that it is not that easy, we will come up with other strategies of positive encouragement to apply for college. Step by step.

Mr. Smith: Excellent. When do we start?

Utilizing a basic pedagogic technique of delivery and application of information, the consultant provided the idea (reverse psychology or prescribing the symptom) and later explained how to apply it (bringing speakers). This will have a follow up of more specific interventions.

Reinforcing. The reinforcement strategy is based upon the constant reaffirmation that the consultation process is being implemented (Brigman, Mullis, Webb, & White, 2004). More importantly, it consolidates the commitment toward positive change.

Consultant (School Counselor)—Mrs. Stuart
Consultee (Parent)—Mr. Blagovejic

Dialogue:

Mrs. Stuart: Okay, let's see if things have changed with Tommy at home. Are you following the instructions that I gave you last week?

Mr. Blagovejic: More or less.

Mrs. Stuart: Remember that it is critical to keep a stable routine with regard to behavior and be persistent. ADHD is a condition that aside the medication can be controlled with a solid routine at home. Let's go over some of the basic instructions again, okay?

Mr. Blagovejic: Okay, that sounds good.

In a way, reinforcing is based on repetition. The school counselor could provide the same information from a different angle or simply remind about aspects of the consultation. The idea is to refresh the initial interventions with positive encouragement.

Paraphrasing. The basic message delivered by the consultee is reflected back by the consultant. The idea is to keep the content intact as a reflective strategy (Thompson, 2002). Paraphrases tend to be shorter than the initial statement and should not be convoluted in nature.

Consultant (School Counselor)—Mrs. Uribe
Consultee (Teacher)—Mr. Ramazzoti

Dialogue:

Mr. Ramazotti: I am so upset right now…I don't believe it. How did that parent dare to say that I am not a good teacher? I bet that she is upset because her daughter got a C on the last test. Well, I am sorry but that's the grade that she earned, plain and simple. She insulted me on the phone and is demanding a parent–teacher conference this afternoon! I have another commitment. God, I am so upset! I feel like…

Mrs. Uribe: You are upset and feel invalidated as a professional because that parent does not appreciate your hard work. And, you feel that you are losing control and about to do something that you may regret.

Mr. Ramazotti: Yes, that's how I feel, exactly.

Mrs. Uribe: Let's talk a little bit more about how you feel and later on I have a couple of strategies that will definitively help you in dealing with these kinds of challenges. Usually, these situations can be diffused with the appropriate interventions. So you will apply them and keep me posted. Okay?

In essence, the consultant is utilizing some of the same words that the consultee is using and emphasizing their importance. This is a basic counseling strategy that is transferable into the consultation arena. After the emotions are under control, the school counselor (consultant) can provide the consultee with strategies on how to deal with difficult parents and keep the potential crisis under control, but it was important to let him know that she was listening by paraphrasing the content of the conversation.

Listening. Listening is more than hearing. It implies an active process in which the nonverbal and verbal messages are carefully considered. Listening implies action; it is not a passive process (Marks, 1995). More importantly, listening must be empathic and not judgmental.

Consultant (School Counselor)—Mrs. Crede
Consultee (Student)—Jani

Dialogue:

Jani: I have tried to be nice to the art teacher; I have tried everything, believe me. I mean, I raise my hand, bring my materials, and do my homework but she always finds an excuse to pick on somebody. I am really tired of her. What's wrong with her? I am not an artist like most of my friends but at least I am trying. She thinks that she is Picasso, perfect, you know. I am sick of her and the class.

Mrs. Crede: Uhm, you are really upset. I can see it in your eyes. Tell me more about how you feel.

Jani: I am tired, period. I want to confront her personally. You will see…

Mrs. Crede: You did the right thing by coming here. This is a safe place to talk and I will help you. Please, what do you have in mind? After we talk about your feelings of discontent and distrust I can give you some techniques that you can use to handle your own feelings and how to deal with your art teacher. You can implement them and you will come back to me. Then, if those don't work, we can certainly look for other alternatives. I realize that your teacher is a very demanding teacher and has her own way of teaching the class.

The consultant (school counselor) is promoting full disclosure without invalidating the story and without being judgmental. After listening carefully, the consultant is ready to provide specific information on how to deal with the art teacher and other difficult people.

Exploring Resistance

Using the analogy of individual counseling, at times the consultant will encounter resistance from the consultee even if his or her intentions are noble. At times, the consultee may behave in a defensive manner and adopt an adversarial position (Cowan, 2005; Shelton & James, 2004). This should not take the consultant by surprise; levels of resistance are to be expected at some point.

Consultant (School Counselor)—Mr. Ferro
Consultee (Group of Parents)—Parents

Dialogue:

Parents: We cannot believe the attitude of the school principal. We are ready to send a letter to the superintendent and go to the press if necessary!

Mr. Ferro: This is our third meeting. Let's review our plan of action as delineated two weeks ago…

Parents: We don't think that the plan is working very well and we want to take action right away.

Mr. Ferro: Can you be more specific and let me know what is not working? As I recall, we all came up with the plan as a group.

Parents: Well, it is too slow…and…

Mr. Ferro: I believe that we had talked about getting a consensus from all the parents by collecting some surveys and running some focus groups in order to come up with a more comprehensive plan to change the situation in the school. I believe that we mentioned that it was not the school principal's fault but that it was a more systemic situation.

As in counseling, sometimes the consultee believes that the consultation process will provoke changes overnight and without the investment of energy. Reinforcement of the process is necessary and a challenge of preconceived ideas.

Exploring the Source of Resistance. There are many possible sources that can be attributed to the resistance displayed by the consultee. Among them are the nature or personality of the consultant, the lack of structure of the consultative process, the degree of dysfunctionality of the system, and the individual traits of the consultee. Resistance is defined as any intentional or unintentional behavior designed to obstruct a positive outcome (Cowan, 2005).

Understanding and Managing Resistance. Resistance is an indirect way of communicating that there is something making the consultee uncomfortable. Ideally, the consultant would like to know what is impeding the progress of the consult, but as in any other type of human interaction, communication is not always direct. Resistance can create frustration and discouragement, and it can slow down or block the consultation process if it is not managed appropriately. If the consult involves drastic implementation changes on the part of the consultee, resistance may be an appropriate reaction. If Mr. Ramos, a ninth-grade teacher, is instructed to assertively communicate with the school principal, Mrs. Richardson, he may present some degree of resistance out of natural fear of the potential consequences, because he does not hold a permanent position at the school. It is very likely that Mr. Ramos will not follow the recommendations of the consultant; his reaction is somewhat rational. In a case like this, the consultant and the consultee may have divergent outlooks about the consult (Randolph & Graun, 1988). Mr. Ramos may think that he is losing total control of the process and is feeling helpless— control tends to be a critical point that is at times conspicuously disregarded in consultation (Block, 1981).

Similarly, if Mr. Ramos discloses that he is not the most assertive person and he tends to be respectful and a passive follower, that could bring up feelings of inadequacy. When consultees feel vulnerable and inadequate, they may be worried that they are responsible for the problem (Alderman & Gimpel, 1996).

Consultant's Cultural Insensitivity. Mr. Tupec, a ninth-grade teacher, is a first generation Guatemalan-American of Native Indian heritage who left his country when he was an adolescent. He still speaks his native Indian language and Spanish. Respect and deference to people who hold positions of authority are highly regarded values held by Mr. Tupec. He has experienced difficulties with the school principal, Mrs. Richardson, who has put an immense degree of pressure on him in spite of the fact that he is a first-year teacher and has just completed his bachelor's degree in education a couple of months previously.

The school (counselor) consultant is a little exasperated with Mr. Tupec because he is not following the advice given. He is reluctant to "stand up" to Mrs. Richardson, and he seems to take it all without responding assertively. It is clear that there is a cultural gap between the consultant and Mr. Tupec. The consultant is unable to see that the cultural values held by Mr. Tupec are the reason behind his behavior and not a stubborn attitude.

As indicated by Sue, Arredondo, and McDavis (1992), consultants must be open to alternative worldviews and should employ techniques that respect and honor other cultures. In order to respect other cultures and worldviews, the counselor (consultant) must be aware of his or her own culture and biases (Vernon & Clemente, 2005). As the consultant engages in a journey of self-exploration, several issues such as applying culturally sensitive interventions, exploring other cultural views, the concept of time, personal versus collective responsibility, internal versus external locus of control, learning styles, and challenging European-driven interventions as the only alternatives should be carefully explored.

Individual-Focused Consultation

As indicated in previous sections of the chapter, the school consultant will work with different types of consultees at different levels: individual, group, and system. This section points out the unique characteristics of individuals that can require the services of a school consultant and how these individuals' needs in the school context may require completely different consultative approaches.

The Student

As in any interpersonal relationship there are issues of power, status, and control, and school consultation is not an exception. It is vital to acknowledge that in the school system students find themselves on the lowest rung of the ladder when issues of power are considered. More than the teacher and the administrator, students are vulnerable. Students will approach school counselors for consultation when they have tried other resources such as friends, family members, or even teachers. They recognize that the school counselor is a source of information but he or she is not always the first selection of choice. As a result, the school counselor must be aware that when a student knocks on the door out of his or her own volition, a sense of discouragement or vulnerability may be present.

For instance, Christie, a high school junior, is extremely anxious about her academic performance in her chemistry course. She had been thinking about a career in medicine but during the last two years her performance in science has not been the best. Due to her low grade in chemistry she is having self-doubts about her future. She stopped by the office of the school counselor to seek information about other careers that may not be science oriented. As indicated previously, the school counselor must let Christie finish her story and realize the magnitude of her situation and the impact it is having in her life. There are two different issues: (1) self-efficacy and personal doubts and (2) information about other careers. One falls within the consultative role (information) and the other one (self-efficacy) falls within the counseling role. The consultative role (information) can be easily addressed by presenting options and directing Christie to additional sources that she can access.

Either the consultative or the counseling roles are led by the theoretical orientation of the school counselor. For instance, an Adlerian consultant would teach Christie specific psychoeducational ways to deal with the situation (e.g., realigning goals, study habits, life style; Dreikurs, 2004), and a constructivist school consultant might deal with the language used and how it creates a reality that is socially constructed (Gutterman, 1994). For example, a situation becomes a problem if it is seen as a problem, otherwise it is not.

The following points should be considered when working with a student regardless of the theoretical orientation:

1. Identify the problem, acknowledge the breadth of its impact, and decide if remedial action is to be taken. Convey a sense of hope and resolution.
2. Prioritize the goals and objectives.
3. Respecting confidentiality, carefully present the idea of collaboration with other professionals (e.g.,

social worker, school psychologist, tutor, administrator, special education teacher) as a way to enhance the consultation process.
4. Monitor the process by reviewing the objectives and communicating what is being achieved with the student.

The Teacher and the Administrator

The professional dynamics between the teacher or administrator and the school consultant are considerably different from those with the students. The school consultant operates in a more collegial fashion with the teacher than with the administrator, who is seen as a superior and an evaluator. The power differential dynamics can exert some influence when the school consultant is facing a possible ethical dilemma. For example, the school consultant knows that Mrs. Richardson (school administrator) has been unfair with Mr. Ramos (ninth-grade teacher). The consultant must deal with the intransigent and rigid behavior of Mrs. Richardson, who is the consultant's supervisor as well. If her approach is too abrupt, she fears that Mrs. Richardson could retaliate in the evaluations. On the other hand, Mr. Ramos needs assistance. Thus, an ethical dilemma is created.

Unless the consult came as a result of a very specific interactional dynamic, most interventions that require skill training or development for teachers and administrators work better in a psychoeducational format rather than in individual one (Caplan & Caplan, 1993; Parsons & Kahn, 2005). Consultations in schools, therefore, can take the form of workshop training for teachers and administrators, as well as with parents. When developing a series of workshop training sessions, the following should be considered:

1. Pick an in-service training day as opposed to an optional training day. This way you will be able to target a broader audience.
2. Send various announcements and reminders via e-mail or school letters about the content of the workshop.
3. Compile some input from teachers and administrators about other areas that should be addressed.
4. As you deliver the workshop, do not mention the names of specific teachers or supervisors. This could either embarrass them or create the illusion that the sole purpose of the workshop is to correct the deficiencies of certain colleagues.
5. Develop clear goals and objectives.
6. Create learning activities devised to target specific subgroups.
7. Do not exclude the school administrators. Select a day in which all the administrators can be present and actively participate.

Consultant (School Counselor)—Mrs. Burton
Consultee (School Principal)—Mr. Brown

Dialogue:

Mr. Brown: I have noticed that there is a high degree tension among teachers, and I've seen a lot of overly stressed teachers. In fact, I know that the degree of absenteeism among teachers is high because of the stress levels. I am very concerned about five or six teachers specifically. Do you have any ideas on how to address this issue?

Mrs. Burton: I have seen the same thing because some students have complained to me about how grouchy some teachers are lately. I am glad that you came to me because I have a couple of ideas.

Mr. Brown: Excellent. Tell me more about it.

Mrs. Burton: I believe that I can send a short survey to explore the current climate of the school and add a section about areas of personal growth. Based on the feedback, I can arrange a series of workshops of one hour every two weeks during our early-release day or a morning session during our next in-service meeting. I can do some of the workshops and I can invite one or two colleagues who are very good at stress management techniques for teachers. What do you think?

Mr. Brown: I really like that idea, let's work on our calendars.

In the example above, the school counselor (consultant) included the school principal (consultee) in the process and in a way demanded his commitment to the consultation process and its implementation. Also, the input of the teachers is respected by asking them what their needs are via a survey. Another aspect of it could be that the survey may bring information about the school principal, which is another dimension of the consultation process. In other words, the survey may reflect that the school principal (Mr. Brown) is being too demanding and intolerant by not listening to the teachers' demands and needs. That would help the consultant to have a frank conversation with the consultee and explore other options.

The Mental Health or Community Counselor

Although one may have the impression that school counselors are isolated, they do not operate in a vacuum. They are constantly relying on feedback from teachers, students, administrators, parents, and professionals in the commu-

nity. As an illustration, Mr. Carsinni consulted with the school counselor about Irina (tenth-grade student) regarding her lack of emotional affect in the class and her pattern of withdrawn behavior. He is very concerned about her. By interviewing Irina, the school counselor found out that she is facing a severe depression and is at a high risk for committing suicide if the pattern continues. Due to lack of training in using the *DSM-IV-TR* (American Psychiatric Association, 2000) and diagnosing mood disorders, it was imperative that the school counselor consult a mental health counselor.

Depending on the school district's resources, there are specific contracts between schools and mental health agencies via area education agencies. The mental health counselor should be seen as a close ally who can provide a rich source of information and immediate help to the students (Caplan & Caplan, 1993). The following criteria must be considered in determining if there is a need to consult a mental health counselor:

1. The school counselor does not possess the knowledge base to help a student.
2. Issues of mental health take precedence over academic areas.
3. There is a clear pattern of poor mental health conditions among the student's relatives.
4. The student's emotional issues put his or her life at risk as well as those of his or her classmates.
5. Skill development or career interventions are ineffective as a result of the hindrance created by the mental health condition.
6. The emotional spiral of a student is disrupting the normal course of school activities.
7. Access is available to mental health treatment.

Once the first contact has been established with the mental health counselor, the school counselor should not "release" the student without any follow ups. On the contrary, the school counselor should keep in close communication with the mental health counselor and monitor the student's progress and try to get a release of information from the student or parents so as to be able to keep abreast of the treatment and progress. School interventions should be consistent with the treatment provided by the mental health counselor and should not create antagonism.

Group-Focused Consultation in Schools

A school is more than a physical building containing teachers and students. As a complex system, a school is situated in a community, but at the same time, a school is part of a school district. The school district is ruled by the State Department of Education, which is influenced to a certain extent by the federal government and by the taxpayers, parents, and corporate businesses. Just as individuals have needs, schools have deficiencies and strengths. According to Parsons and Kahn (2005) schools are affected due by changes in demographics, industries, and the economy. In order to explore the needs of a school, consultants can develop formal *needs assessments to explore the current state, identify the gap*, and *formulate what is sought* or the *desired state*. Most school districts prefer to work with data-driven results as opposed to speculative experiential reports. To justify funding for new programs or new teaching positions, school districts rely on quantitative results with projective numbers. Serving as a consultant in a school is a major task because of the complexity of the interactive subsystem. For instance, Mrs. Carter, a school counselor in district B, was hired to conduct a consultation project in a school located in district A. The school principal is noticing that as a result of the configuration of the school boundaries more African American students are entering the school.

The number of European-American students has been declining drastically, various European-American teachers have resigned or requested transfers to other districts, and the real estate market has suffered. The school principal sees a trend that he is already labeling "White flight," and he is afraid of a decline in funding and an eventual erosion of the quality of education. Mrs. Carter has been hired to explore the reasons why more students are leaving (aside of the obvious racism) and to come up with a set of recommendations to ameliorate the situation.

A system analysis implies that Mrs. Carter will have to survey and interview teachers, students, parents, administrators, leaders of the community, and business individuals in order to formulate a systemic explanation of the problem. She may have to triangulate her results with existing documents or similar studies conducted in other districts that mimic district A. There are several aspects that must be considering when assessing a school:

1. Explore all the elements, forces, and variables affecting the school, that is, internal and external forces (Gallessich, 1974).
2. Explore the supportive and negative elements; do not concentrate on only the negatives.
3. Evaluate the unique culture of the school as well as the institutional history, physical surroundings, traditions, and collective patterns.
4. What are the symbols that characterize the school (e.g., logos, symbols, rites)?
5. Assess the common assumptions about the school (e.g., reputation of being good at sports, or a tough place).

6. In addition to the surveys, analysis of existing documents, and interviews, the school consultant must be a naturalistic observer. Without intruding on the system and prior to getting any form of documentation, observe the general dynamics of the school; for instance, the quality of interactions among teachers, students, administrators, and individuals from the community.

In sum, the consultant must have the mind of an investigator by being open to all kinds of explanations and by exploring areas that may have been ignored or taken for granted. Because the school is a complex system that does not operate in a vacuum, all possible subsystems must be considered as interrelated elements. Trying to find one cause or precipitant of a problem is not the best approach, but observing all the elements as each influencing the other facilitates the consultation process.

Future Directions in Consultation

National Cultural and Ethnic Changes: Creating a Multicultural Environment

Our society is faced with some of the biggest challenges ever; globalization, the Internet, and the disappearance of national and economic boundaries are just a few. As a result, the United States is facing rapid ethnic changes and, as a consequence, a shift in cultural standards. The shift in cultural standards implies that the way education has been delivered will change because a more diverse majority of non-European descent will dictate the standards.

Members of underrepresented ethnic groups are expected to constitute 50 percent or more of the U.S. population by the year 2050 (U.S. Bureau of the Census, 2000). These statistics are being used to highlight the importance of more inclusive and culturally responsive interventions for a growing number of young diverse ethnic clients (Atkinson, Morton, & Sue, 1998). According to the U.S. Bureau of the Census (2000), Latinos (Hispanics) have reached demographic parity with African Americans and would perhaps surpass them if undocumented individuals are taken into account. By the year 2020, an estimated 57 million Latinos will be residing in the United States, according to the current demographic growth (Dana, 1993; Marin & Marin, 1991).

In order to be abreast with the multicultural changes of our society, the school consultant, regardless of his or her ethnic background, has to promote a local environment that invites and welcomes consultees and clients from different ethnic backgrounds. This promotion of an inviting multiethnic environment starts with the office.

According to Clemente (2004), the following are considerations on how to create an inviting environment

1. Decoration, furnishings, and equipment—Although the presence of diplomas and certificates enhances the professional image of the counselor, a delicate balance should exist between friendly artwork and professional emblems. Art that represents nature, space, freedom, hope, and relaxation may enhance the counseling process. Natural elements such as wooden ornaments, plants, and a small fish tank are appropriate. Wooden furniture, as opposed to metal, as well as a sofa, promotes relaxation.
2. Aroma—The human brain is highly influenced by the presence of certain fragrances, and certain behavioral experiences are connected to the sense of smell (Vroon, 1997). Taking this into account, soft herbal, citrus, or vanilla scents create a comfortable environment.
3. Space—Provide space for children to play, paint, lie on the floor, and get "dirty" without being concerned about cleaning the area. And remember that the way furniture is arranged can communicate status, quality of relationships, and frivolity or warmth (Whiton & Abercrombie, 2002). Also, take into account the concept of personal space. Depending on the gender, age, and level of acculturation of the client, the physical distance between the counselor and the client may vary.
4. Sound, color, and light—Very loud sounds provoke anxiety and discomfort, whereas musical elements and natural sounds contribute to a peaceful and healing atmosphere (Wigram, Pedersen, & Bonde, 2002). For this reason,it maybe helpful to incorporate a small water fountain that mimics the soft sound of a stream. Like the power of sound, light and color stimulate the visual modality; a room that is too bright with artificial fluorescent lights is not as conducive to self-discovery as is the use of pastel colors and ambient lighting.

Ethical Considerations

School counselors who perform consultation duties are ruled by the same code of ethics that regulates the counseling profession (ACA, 1995; ASCA, 1998). Consultants must be familiar with the basic expectations of the code of ethics. The code of ethics does not always provide clear guidelines on how to make ethical decisions; ultimately, the consultant has to rely on his or her values and judgment. The most important aspect to maintaining ethical behavior

is to keep oneself in check by conducting self-reflection exercises on a daily basis. Consultation is not a value-free process because we are not value free (Newman, 1993). Parsons and Kahn (2005) indicate devised an exercise that assesses the consultant's values and provides perspective. These are some of the key areas of the exercise; for each one of the following one is to identify one's belief, attitude, or value about the issue presented.

- Equality of genders
- Need and value of unions
- Use of recreational drugs
- Alternative lifestyles
- Absolute right of privacy
- Value of competition versus cooperation (p. 313)

A basic tenet that governs the consultation profession is confidentiality. The consultant–consultee relationship is based on trust and honesty. Because the consultee is expected to disclose personal information, the consultant must be able to protect the identity of the consultee and the content of conversations. Also, it is critical for the consultant not to use power to take personal advantage of those interpersonal dynamics. The idea is to always maintain a collaborative relationship as opposed to an unbalanced one. As a reminder, the consultee has the right to terminate the relationship at any time.

Conclusion

As a result of the drastic changes in our society and in the educational system, school counselors are called upon to respond to the challenge of consultation. School counselors are coordinators, mediators, teachers, administrators, community liaisons, team builders, and human service experts. Consultation is an exciting challenge that requires serious preparation and analysis in order to deliver responsible services.

Coordinating and integrating all the services that school counselors provide are critical when responsibly attending to the needs of consultees and clients. Consultation should not be seen as another "task" on the list but as a critical element that enhances their already diverse repertoire. Consultation will become more important as the boundaries of the community, school, and businesses become more fluid than ever.

XXIV
THE SCHOOL COUNSELOR'S ROLE IN CREATING CARING SCHOOL COMMUNITIES

JENNIFER J. LINDWALL AND HARDIN L. K. COLEMAN
University of Wisconsin–Madison

> A community orientation based in caring and support allows children to appraise school as a meaningful social context in which to function. The ensuing sense of belonging and psychological safety, combined with significant academic work that promotes engagement in the community, enables children to achieve to their potential.
>
> **(Baker, Terry, Bridger, & Winsor, 1997, p. 586)**

This quote by Baker et al. (1997) sends a powerful message concerning the impact of the school context, the environment in which youth spend a great deal of time as they develop into young adults. Although the focus of school is often placed on gaining knowledge and increasing cognitive skills (Scott, 1974), much more takes place throughout one's experience within the educational context. School becomes the primary environment in which children are socialized, develop their identities, and become equipped with the skills and the knowledge that are prerequisites for a healthy development. However, youth also face a multitude of challenges within the educational context and the broader society that may prevent them from having positive experiences in school. Therefore, it is critical that school be thought of as not only a physical place, but also a *community* where students feel valued by and connected to the peers and adults with whom they interact every day. School should be established and promoted as an environment that strives to meet the needs of *all* students and that promotes their positive development.

Focusing on the school environment and on how it can best meet the needs of youth is a shift away from a "fix the child" perspective that places the responsibility for change within the student when he or she exhibits difficulties during the educational process. Instead, a focus on the school context involves thinking about how the structure of the school needs to change in order to become a supportive environment that promotes the healthy development of all children. A way in which to establish a positive school environment for youth is by fostering a *caring school community,* a context that provides the foundation for promoting the positive well-being of youth. In establishing

> a stronger, more caring community, it more effectively meets the basic needs of students—their needs for physical and psychological safety; for a sense of belonging and connection to others; for a sense that one is a competent, worthy person; and for a sense of autonomy. (Schaps, 2002, p. 3)

This chapter will discuss the importance of creating a caring community within a school, highlighting the research and conceptual frameworks that illustrate the necessity of making each individual feel as if he or she belongs within the school environment. In the literature, it is well documented that belongingness leads to a myriad of positive outcomes within the educational setting, including the development of basic psychological processes that facilitate success in school, attitudes and motivation toward school, social and personal attitudes, one's degree of engagement and participation, and academic success (Osterman, 2000). It is clear that each individual within the school, including the students and adults, impacts the school climate and the degree to which all individuals feel cared for by others and engaged in the process of learning.

One member of the school community who possesses the knowledge and the skills to foster a caring environment is the school counselor. Worzbyt, O'Rourke, and Dandeneau (2003) advocated that caring and community building

should be at the heart of the elementary school counselor's role. In this chapter, however, the authors believe that school counselors at all grade levels play a critical role in fostering caring school communities. The school counselor has a unique "whole-school, cross-grade level perspective" (Beale & McCay, 2001, p. 258) that enables him or her to implement strategies for building a caring learning environment within the school on multiple levels. School counselors should consider community building as a priority within their comprehensive developmental guidance program, attempting to make each individual feel positive about being a member of his or her school environment. The school counselor plays a pivotal role in addressing the school context and coordinating activities that allow each individual within the school, children and adults alike, an opportunity for "identification and commitment" (Battistich, Solomon, Watson, & Schaps, 1997, p. 138) within the school community. It is this creation of a caring school community, influenced a great deal by the efforts of the school counselor, which will be suggested as a way to promote the positive development of all students.

The first part of this discussion will explore the human desire for a sense of community and, more specifically, what constitutes a school community. Second, six theoretical frameworks that advocate for the creation of school communities will be presented in an effort to conceptualize the ways in which a sense of community is established within schools. Third, the discussion will shift to an analysis of the unique role of the school counselor, articulating why he or she is an appropriate leader in facilitating the development of a school community within a Positive Youth Development perspective. Specific strategies that can be utilized by the school counselor on multiple levels will be presented. Next, the chapter will discuss the implementation process of creating and maintaining a caring school community by presenting a model to guide practice, thoughts about evaluation strategies, and a case example that illustrates how a counselor might implement strategies on multiple levels in order to foster a sense of community for a child in need of support. Finally, challenges to implementing caring community-building strategies will be considered along with suggestions for future directions regarding this critical area of school counseling.

What Is a Community?

In an effort to fully understand what constitutes a community, it is useful to begin thinking about why individuals feel compelled to be part of a community along with the multiple characteristics that are present in effective communities. These ideas will be presented first, followed by a more specific definition of a *school community*. Finally, the benefits of a caring school community will be reviewed in order to gain an understanding of the positive impacts that are felt by the establishment of this kind of positive environment.

The Need for Community

All human beings have the innate desire to establish caring, meaningful relationships with other individuals and feel as if they belong (Baumeister & Leary, 1995; Noddings, 1992; Sergiovanni, 1994). This need to feel connected to others begins in adolescence and continues throughout adulthood (R. M. Lee & Robbins, 1995). A sense of belongingness occurs when individuals engage in positive interpersonal experiences on a regular basis within an environment that includes concern for the well-being of others (Baumeister & Leary, 1995). The community context is defined not only as a physical entity that can be delineated by geographical boundaries but as one that includes a psychological component as well. This latter element is a critical piece that is present in effective communities and includes a feeling of solidarity and support that is experienced by the members (Magrab, 1999). Therefore, the process of creating communities appears to be an appropriate way to satisfy the natural drive to belong, promote one's psychological well-being, and allow an individual to engage and identify with a collective group.

School as a Caring Community

Just over 10 years ago, the idea of structuring schools as communities was discussed by Sergiovanni (1994). He explained that we must shift our conceptualization of schools as organizations to schools as communities in order to make them successful, positive environments for students and adults alike. He stated,

> Community building must become the heart of any school improvement effort. Whatever else is involved—improving teaching, developing sensible curriculum, creating new forms of governance, providing more authentic assessment, empowering teachers and parents, increasing professionalism—it must rest on a foundation of community building. (p. xi)

This shift in thinking involves understanding that youth want to feel included in their school community and experience it as a context that facilitates their positive growth and development (Kuranz, 2002). Furthermore, youth perceive school as a critical context of safety (Cookson, 2004). When one feels as if one belongs to this safe school context, it means one is feeling "needed, as well as needful,

and believing that you have something vital to contribute" (Charney, 1992, p. 14). Therefore, conceptualizing schools as communities and fostering a sense of belonging and security for youth appears to be a critical focus that warrants the attention of educators and educational researchers alike.

A critical piece of understanding schools as caring communities is the realization that *community* is used in a broad, inclusive sense of the word. The process of establishing a sense of community within schools involves *every* individual, ensuring that he or she feels a part of the school community. Furthermore, a sense of community is not only fostered between students, but among *all* individuals within the school. This includes fostering a sense of community among students, between staff and students, among staff, and with those beyond the school. When one examines schools by looking at the whole "school context" in this way, one is utilizing a relational approach to school improvement. This type of approach facilitates caring relationships among all individuals within the school while creating a sense of meaning from academic work as well (Baker et al., 1997).

For students, a sense of community must be fostered with other students as well as with adults in the school. Feeling connected to peers impacts the degree to which students feel comfortable participating in their learning process. For example, one place to build positive connections among students is within the classroom. If these connections are established, the classroom becomes a supportive context for learning, and it can be compared with that of a supportive "family" (Lewis, Schaps, & Watson, 1996). When this type of environment is created, "the caring classroom provides a sense of belonging that allows lively, critical discussions and risk-taking" (Lewis et al., 1996, p. 21) to occur. Students also need to develop positive connections with adults in the school. *All* school staff, such as teachers, administrators, counselors, custodians, and assistants, should make an effort to establish caring relationships with students in an effort to facilitate the success of every student (Kuranz, 2002).

A sense of community is also critical among the adult staff. For example, the school staff members need adequate time to share ideas, collaborate, and communicate with one another in order to help them feel supported by their colleagues. Furthermore, a positive collegial community is also beneficial to the students. For example, when staff members have the time and skills to effectively communicate with one another, they are more likely to work together to create an inclusive environment for the students; particularly for those with special needs who are oftentimes feeling left out of the educational experience (Carpenter, King-Sears, & Keys, 1998). Also, creating a "community of colleagues" to help new teachers feel supported will help them to meet their needs within the school; in turn, they are more likely to better serve the students in their classrooms (Lundeen, 2004).

In addition to fostering positive relationships among all members within a school, it is imperative to include those who extend *beyond* the school. Building caring school communities also involves active collaboration with families and partnerships within the greater community in which the school is located. It has been suggested that families and the larger community have a significant impact on the educational and developmental success of students. Therefore, a combination of educational and social supports will help not only students, but also their families to feel supported (Azcoitia, 2002; Brandt, 1991). It has also been suggested that specific efforts, such as addressing school violence, need to involve multiple contexts in order to be most successful (Collins, 2003). School–family–community collaborative efforts may also help to foster important protective factors in at-risk youth (Bryan, 2005). In the words of Stanley, Juhnke, and Purkey (2004), it is critical to remember that "[e]verybody and everything in and around the school adds to, or subtracts from a safe and successful school" (p. 307). When one individual or a group of individuals, whether they are students, staff, parents, or community members, experiences something positive or negative, the entire school community feels the effects of that experience.

Furthermore, the increasing diversity within American schools calls for not only the establishment of caring communities, but also *multiculturally* competent educational environments. One component of developing these types of schools is creating a sense of community with culturally diverse members by shifting toward a "salad bowl" concept of diversity rather than the "melting pot" metaphor (C. C. Lee, 2001). School staff should recognize that creating caring school communities helps youth become competent and able to succeed in an increasingly diverse world (Pohan, 2003). Therefore, the establishment of a school community that truly cares for each individual should be promoted. Cultural diversity should be recognized and celebrated among the school community rather than used as a means for further isolating and segregating students based on race/ethnicity, gender, sexual orientation, socioeconomic status, immigration status, religion, ability, and so forth.

Critical Elements of Successful School Communities

In an effort to improve the educational experience for youth, particularly those considered at-risk, a study was conducted for the Office of Educational Research and Improvement, U.S. Department of Education (Rossi &

Stringfield, 1996). The sites for individual case studies were 18 schools that had been recognized as effective in working with at-risk youth. One major implication that was reported from this effort was the fact that establishing and maintaining a strong sense of community within the school was critical for meeting the needs of students. In their review, Rossi and Stringfield identified a number of key elements that are present within those schools that function as true communities. These components, several of which are closely related, include a shared vision, shared purpose, and shared values; incorporation of diversity; communication and participation; caring, trust, and teamwork; and respect and recognition. The first set of elements, *shared vision, shared purpose, and shared values* involves having well-established educational goals and efforts to provide supportive relationships to reach those goals. The second key element, *incorporation of diversity*, includes promoting the strengths of students, embracing diversity, celebrating culture, and involving family and community. Next, *communication and participation* refer to opportunities for ongoing dialogue among adults and youth in an effort to allow all individuals to have a voice in the educational experience. *Caring, trust, and teamwork* consist of conscious behaviors that allow both students and adults to feel cared for and valued by their school community (e.g., giving handshakes, assigning mentors to students, acknowledging one another by name), and they are oftentimes present because of having effective communication and active participation among everyone in the school. Finally, *respect and recognition* include positive affirmation and acknowledgement of each individual and his or her contributions to the school community. According to Rossi and Stringfield, these elements create the foundation for facilitating positive relationships among students, among staff, and among staff and students in fostering a successful educational context.

The creation of a caring school community clearly involves *all* of its members, both children and adults, as well as individuals and agencies in the larger community, including family and community partnerships. Once a school understands this concept, they must also realize that the decision to foster a caring environment involves much more than simply identifying it as such.

> It requires us to think community, believe in community, and practice community—to change the basic metaphor for the school itself to community. We are into authentic community when community becomes embodied in the school's policy structure itself, when community values are at the center of our thinking. (Sergiovanni, 1994, p. xiii)

In sum, creating and maintaining a caring school environment needs to be integrated into every aspect of daily life within the school and requires a commitment on behalf of all of its members to contribute positively to that community. The critical elements that have been identified by Rossi and Stringfield (1996; a shared vision, shared purpose, and shared values; incorporation of diversity; communication and participation; caring, trust, and teamwork; and respect and recognition) are useful in understanding what constitutes a successful school community.

Schools as Caring Communities: Positive Benefits for Youth

Establishing schools as caring communities strives to fulfill the basic need of belongingness among youth, allowing students to feel as if they are cared for and valued by peers and adults alike. In a review of the literature, Osterman (2000) reported that a feeling of belongingness is related to five significant outcomes within a school setting: development of basic psychological processes that facilitate success in school, attitudes and motivation toward school, social and personal attitudes, one's degree of engagement and participation, and academic success. These five outcomes provide a useful way in which to understand how helping to facilitate a sense of belongingness within the school environment, through the creation of a caring school community, impacts youth in multiple positive ways.

Development of Basic Psychological Processes

Researchers have suggested that through the process of engaging in a caring school community, youth are likely to have their basic psychological needs met (e.g., belonging, autonomy, and competence). In other words, a higher involvement in the school community will lead to a more complete fulfillment of one's basic needs. Taking part in a caring school community will also facilitate one's intellectual, social, and moral development (e.g., acquiring knowledge of academic material, thinking/problem-solving skills, empathy, social skills, and understanding of others and of the community's values). The development of these factors also leads to the fulfillment of one's basic psychological needs, especially a sense of self-efficacy (Schaps, Battistich, & Solomon, 2004). Worzbyt et al. (2003) write, "As children learn how to build caring connections, through their smiles, positive feedback, self-affirmations, and planned acts of kindness, they begin to experience total well-being" (p. 10). Furthermore, when youth feel as if their developmental needs are met and feel supported by and cared for within their school environment, they are more likely to embrace the shared values of the school community (Solomon, Watson, Battistich, Schaps, & Delucchi, 1996).

Attitudes and Motivation Toward School

Establishing a caring community can potentially help improve students' attitudes and motivation toward school by helping students to feel more valued and included in the educational process. A positive educational environment that fosters belongingness, such as a caring school community, is more conducive to learning and increases students' sense of connection to school and sense of safety. When a caring community of learners is present within a school, its members feel valued by and connected to others and therefore more committed to and motivated in the learning process (Lewis et al., 1996). As a result, students who are more connected to school may have a more overall positive attitude about school and may feel more motivated to take part in school-related activities. For example, Karcher and Lindwall (2003) described those high school students who volunteered to serve as mentors for elementary school students as being more connected to school than those in the comparison group. Therefore, youth who feel more connected to, or a part of, their school community may be motivated to become even more involved by taking part in activities that are offered within the school context.

Social and Personal Attitudes

Fostering a caring school community has the potential to help students develop positive social and personal attitudes about one another and the school. For example, middle school students reported that they value caring relationships with their teachers and perceive their teachers as helpful when they display caring words and behaviors. These students also felt a greater sense of control and safety within their classroom when caring was present (Alder, 2002). This study suggested that when adults model a caring environment, the students will adopt and internalize these values and come to appreciate this type of context. Another study conducted by Perry (2002) examined an elementary school that utilized a "Community of Caring" program that aimed to facilitate healthy youth development and positive decision-making skills. Several values including respect, trust, caring, responsibility, and family were emphasized within the school and modeled by the adults. In general, the majority of the students within the school reported a high sense of belonging and felt that they were respected by all of the individuals within the school. Both the staff and the students attributed their school's sense of community to the "Community of Caring" program. Solomon, Battistich, Watson, Schaps, and Lewis (2000) reported findings from schools that implemented the Child Development Project (CDP), which included a community-building component. In this study, five CDP schools that "progressed in implementation," compared with non-CDP schools, showed positive benefits in personal, social, and ethical attitudes, values, and motives within students. Caring relationships with adults have also been suggested to be a protective factor for at-risk youth. When youth were asked about their descriptions of caring adults, they identified seven characteristics: trust, attention, empathy, availability, affirmation, respect, and virtue. These characteristics helped foster trust within the youth, allowing them to establish a positive connection with an adult (Laursen & Birmingham, 2003).

Engagement and Participation

The first theme that emerges within "engagement and participation" is the notion that facilitating a caring school community can help *increase* the positive engagement and participation of youth in school and related activities. For example, youth who attended a school that specifically focused on building a caring community as part of the CDP were more involved in school, showed a greater commitment to school, and were more prosocial (Battistich, Schaps, & Wilson, 2004). In another CDP study, elementary schools where classroom teachers exhibited practices that focused on fostering a school community were associated with more positive outcomes, including engagement in school and positive behaviors, than the comparison schools. Community building within classrooms included teacher practices that emphasized prosocial values, facilitation of youth's thinking and sharing of ideas, cooperation, warmth, and supportiveness. In addition, low use of extrinsic control was associated with positive classroom behaviors among the students. Furthermore, the positive outcomes were related to the students' sense of school community (Solomon, Battistich, Kim, & Watson, 1997). In another longitudinal study, Epstein and Sheldon (2002) reported that family–school–community partnership strategies were effective in increasing student attendance. These authors suggested that elementary schools might be able to increase student attendance by using strategies that involve community and family collaborative relationships.

The second theme suggests that fostering a caring school community can help *decrease* negative school and other youth behaviors. For example, schools where students felt a stronger sense of school community have been linked to lower average drug involvement and delinquency rates (Battistich & Hom, 1997). Also, students who attended a CDP school engaged in fewer problem behaviors than youth who belonged to schools that did not have a specific caring community-building program in place (Battistich et al., 2004). Teachers at schools who actively included community building within their classrooms reported that youth exhibited fewer discipline problems, and as a result, fewer referrals were made (Chesswas, Davis, & Hanson,

2003). Schools with higher levels of sense-of-community scores had lower average drug involvement and delinquency among students. This may suggest that the environment of the school moderates relationships among risk factors, protective factors, and developmental outcomes. Therefore, when students perceive school to be a community, this experience may foster increased resiliency (Battistich & Hom, 1997). Finally, collaborative relationships between families, schools, and communities have been shown to decrease chronic absenteeism in students (Epstein & Sheldon, 2002).

Academic Success

Finally, school community building efforts have also been shown to have an impact on the academic accomplishments of students. For example, youth who attended well-run CDP schools during elementary school were more academically successful and associated more with prosocial and less with antisocial classmates than the matched comparison students (Battistich et al., 2004). Community building, in combination with high expectations and challenging, engaging opportunities to learn, has also been shown to promote academic achievement particularly for low-income students (Schaps et al., 2004). Finally, in a review of literature on the impact of parental involvement on academic performance, Spera (2005) reported that parental involvement in school and monitoring of after-school activities promotes the academic success of youth.

Consideration of Cultural Diversity

Although the authors of this chapter advocate that fostering a caring school community includes helping all youth to feel a sense of belongingness and connection to school and emphasizes that the process of doing so has benefits for all youth, it is important to consider how those from diverse backgrounds might particularly benefit from such an effort. For example, those youth who differ in some way from mainstream culture—whether by race, ethnicity, sexual orientation, and so forth—might be at an increased risk for feeling disconnected from school and lack a sense of belongingness since it, too, is modeled after mainstream culture and may not be culturally sensitive to the diverse needs of its students.

In the literature, several examples emerge that highlight the notion that youth from diverse backgrounds will particularly benefit from the establishment of a caring school community. One group that is at risk of being disconnected from school is racial/ethnic minority youth, who overall are not performing as well academically as their European American peers. McMillian (2004) suggests that in order to truly address this achievement gap, it is the responsibility of educators to help minority youth feel as if they are valued by society and within their schools. Therefore, creating a sense of school community can be a step in this direction. Youth from economically disadvantaged families may also be at risk for feeling disconnected from school. Battistich et al. (1997) reported that the potential for improving a sense of school community appears to be greatest within those schools with significant populations of low-income students. Perhaps for this group of youth, a caring school community has the potential to provide a sense of safety and security despite the economic hardships within their families. Finally, young women in schools may be vulnerable for feeling disconnected from the school community if issues of gender are not taken into consideration when addressing their needs. Cook, Heppner, and O'Brien (2002) discussed the importance of using an ecological perspective in providing vocational guidance with women of color and White women, which can also be applied to school counselors who work with young women. These examples highlight how a caring community environment within a school can be specifically responsive to and respectful of the cultural diversity among youth. The report discussed earlier by Rossi and Stringfield (1996) did, after all, examine schools that were particularly effective at addressing the needs of at-risk youth, and one of the primary ways in which those schools were effective was the way in which they fostered a sense of community.

Clearly, the establishment of a school as a caring community positively impacts youth in numerous ways. Battistich et al. (1997) summed up the importance of creating a caring school community by describing that it

> provides the individual with a focus for identification and commitment, rather than simply offering personal support. Students' needs for competence, autonomy and belonging are thus met when they are able to participate actively in a cohesive, caring group with a shared purpose; that is, a community. (p. 138)

With this idea in mind, the discussion will now turn to a consideration of multiple perspectives that offer suggestions about how community building in schools actually looks.

Six Perspectives: A Foundation for Understanding School as a Caring Community

Within the literature, a number of different theoretical frameworks emphasize the importance of addressing the context of the school and, particularly, advocate for build-

ing a sense of community. As we know from the literature on effective counseling (Wampold, 2001), having a theory to guide practice translates into improved effectiveness. Wampold also pointed out that there are many theories that lead to effective practice. These findings suggest that a school counselor is well served if he or she uses theory to guide practice but that the theory needs to be compatible with the school counselor's worldview. In order to represent the range of options, we will review the following theoretical frameworks for creating a caring community: *Tribes* (Gibbs, 2001); Frank's (2004) "The Caring Classroom"; Kohn's (1996) "The Classroom as Community"; the Search Institute's (2003, 2004) "40 Developmental Assets"; the Child Development Project (Battistich et al., 2004; Battistich et al., 1997; Developmental Studies Center, 2005; Schaps et al., 2004); and the Invitational Theory of Practice (Purkey & Aspy, 2003; Purkey & Schmidt, 1996; Stanley et al., 2004). It is important to note that these frameworks differ somewhat in their approaches. For example, some, such as *Tribes*, describe the creation of a caring school community as the main goal, while the Search Institute, for example, describes it as one of the key components involved in comprehensively addressing the needs of youth. Some theories, such as the one proposed by Frank, focus on classroom contexts, while others, including the Invitational Theory of Practice, target the larger school environment. However, each offers valuable insight into how community building takes place within a school. Therefore, each will be briefly reviewed followed by a discussion about its applicability for school counselors and the ways in which they all illustrate the characteristics of effective communities.

Tribes

Jeanne Gibbs (2001) outlines the Tribes TLC (Tribes Learning Community) philosophy, calling for a pattern of interaction that involves educators, parents, and students working together toward common goals on behalf of youth. The overall goal of Tribes is "to engage all teachers, administrators, students, and families in working together as a learning community that is dedicated to caring and support, active participation, and positive expectations for all students" (p. 22). A critical element of this framework is the promotion of inclusion by encouraging each individual to reflect on and share his or her own personal thoughts and experiences. Students and adults are encouraged to utilize a democratic group process that allows them to collaborate on the creation of a positive, supportive environment that facilitates growth, development, and learning.

The Tribes framework calls for the redefinition of the role of teachers in particular and the way in which they structure their classrooms. First, teachers are to work together in groups, rather than in isolation, in order to build critical connections and support networks among the school staff. Second, classrooms are to be arranged so that students sit and work collaboratively in small groups, or "tribes." This creates a student-centered classroom where youth have ownership and participation in classroom functioning. By belonging to a group, each individual feels included and valued in the learning process. This is in contrast to the traditional classroom setting where students most often work independently in a teacher-centered classroom; this type of classroom, however, does not give students much voice in their classroom community. Third, teachers are called upon to use culturally appropriate teaching strategies and promote the development of critical thinking and collaboration skills. Caring, sharing, active participation, and positive expectations are integrated throughout the Tribes process. Because of the practices just mentioned, the Tribes classroom is democratic in nature, promotes inclusion, and fosters a sense of connection and belonging among students. This is largely the result of frequent opportunities for students to collaborate and contribute to their classroom (Gibbs, 2001).

A key component of Tribes includes building a strong community. This process emphasizes four "agreements" which help to foster a positive, collaborative environment. These agreements include attentive listening, giving "appreciations" (e.g., positive statements directed toward others) rather than "put-downs" (e.g., negative statements directed toward others), having the "right to pass," and showing mutual respect for all members of the community. Throughout the process of Tribes, community members are taught collaborative skills and taught how to reflect on the learning that takes place within the school. Through these interactions, a learning environment is created that promotes cooperative learning and positive interaction while establishing continuity for the community of individuals. Tribes recognizes that students' learning and development is greatly influenced by multiple people and contexts, including family, friends, school, and community. Furthermore, it actively seeks to address the multiple environmental factors that impact a student's well-being (Gibbs, 2001).

In recent years, the Tribes process has been evaluated using repeated measures and quasi-experimental design, producing promising results. After 2 years of an ongoing evaluation study (Chesswas, Davis & Hanson, 2003), 13 schools from the original 84 schools that had been implementing Tribes for at least 1 year in grades 2 through 5 participated by completing surveys and engaging in interviews. Several of the authors' overall conclusions supported positive effects related to the creation and maintenance of a caring school community. First, the authors reported increased student inclusion, respect for diversity, sense of

value, collaboration, safe and supportive learning environments, and the development of increased resiliency in adults and youth. Second, results suggested that student engagement and participation in the educational process significantly increased in Tribes schools. Third, both adults and students classified their schools as safe and supportive environments. The majority of students in Tribes schools (82% to 89%) felt that the adults at their schools cared for them, while most of the adults who were interviewed described Tribes as "building community." Fourth, youth were more likely to collaborate with their classmates. Finally, student achievement was also shown to increase in some academic areas in Tribes schools significantly more than in comparison schools: fifth-grade reading and second-grade mathematics (Chesswas et al., 2003). In the subsequent year, similar results were reported when a second evaluation was conducted with fourth- through sixth-grade students (Chesswas & Davis Sosenko, 2004). In addition, findings indicated that there was evidence of mutual respect, improved student-centered work, increased problem-solving skills, improved classroom management, and improved teacher collaboration. Furthermore, a lower incidence of student referrals and suspensions was reported by adults (Chesswas & Davis Sosenko).

Although this research offers support for the effectiveness of Tribes for creating caring school communities, there are limitations and areas in need of further examination. First, there are some discrepancies between what is reported by adults and what is reported by students. For example, 87% of teachers reported giving students opportunities to be "leaders" or "helpers," while only 64% of students reported being given these roles. In addition, 87% of teachers stated that they actively involved students in determining classroom rules while a mere 28% of students endorsed being given this opportunity (Chesswas et al., 2003). Discrepancies were again found in the results presented one year later (Chesswas & Davis Sosenko, 2004). Future research is needed to understand these discrepancies and to determine how the program components are received by both adults and youth. One challenge that was endorsed by nearly all adult participants was lack of time to fully implement the Tribes strategies (Chesswas & Davis Sosenko, 2004). Further research that addresses this issue and efforts to provide support to educators through this process will be important to prevent burnout and/or lack of comprehensive implementation. Finally, the characteristics of the populations used in the studies (e.g., cultural background, geographic location) are unclear, making it difficult to interpret the findings and understand how they apply to diverse populations of youth.

Laurie Frank's "The Caring Classroom"

Frank (2004) described a process for creating caring environments within classrooms by combining theories that promote community building with those that emphasize experiential/adventure-based education. Her framework emphasizes collaboration, and she states, "Once a class of individuals comes together to work toward common goals, with everyone valued and respected, the business of learning can take place fully, without reservation" (p. 17).

Frank (2004) described her "community-building sequence" as a way in which to work toward creating a caring community within a classroom. The first stage in her model is cooperation, which involves working together to create a safe, inclusive environment. Frank indicated that the teacher should encourage the use of "put-ups" (e.g., positive statements about others) rather than "put-downs" (e.g., negative comments directed toward others). In this stage, cooperation is emphasized and students receive consistent encouragement. In addition, active listening and perspective-taking skills are emphasized by the teacher in an effort to allow the students to get to know and work with one another. Trust, the hallmark of stage two, develops when students feel included in the classroom activities and are able to positively work with one another. The students learn that their classroom is a safe environment in which to make mistakes and take positive risks. Empathy is also taught and modeled by the teacher, and there is an understanding that everyone's physical and emotional well-being is protected within the classroom. Cooperation and trust create the foundation for stage three, problem solving. Students feel confident and comfortable taking on group challenges and being able to work through conflict by engaging in effective communication. Finally, challenge is the fourth step that encourages students to set and work toward individual goals. Youth are taught that their community is supportive through both success and failure (Frank).

Frank (2004) described three "community-building tools" that help in the creation of safe, positive classroom communities. First, a "full-value contract" is decided upon by the group. This contract acts as a starting point and establishes the agreements for the functioning of the classroom. It ensures the safety of the classroom environment and each individual's responsibility to contribute to that safety. This tool is applicable to the group's needs and establishes group norms. The second tool is "challenge by choice," which pertains to the individual needs of the students in the classroom. An emphasis is placed on each individual's control over his or her choices, including the choice about the degree to which he or she will participate in different classroom activities. The third tool, "goal setting," includes both group and individual goals. It creates

a framework from which to work through conflicts and make decisions.

Although Frank (2004) provided a well-developed model of community building within schools, there has not been a great deal of research to date that directly evaluates her model. Fortunately, research is currently underway to investigate her model of "The Caring Classroom," which will begin to shed light on the effectiveness of her techniques. Furthermore, Frank asserted that some literature in the areas of brain research and social/emotional learning indirectly support her ideas (L. Frank, personal communication, September 2, 2005). Nevertheless, she does provide important strategies related to community building that warrant consideration and would benefit from future empirical research.

Alfie Kohn's "The Classroom as Community"

Kohn (1996) suggested that in a classroom established as a community environment, the students and adults care for one another and continually receive messages that reflect this sense of caring. Each individual feels valued and thinks "in the plural" by referring to "us," which illustrates the importance of considering the needs of each person within the community. The classroom is established as a physically and emotionally safe context where students feel a sense of connection to one another.

An emphasis of Kohn's (1996) philosophy is the creation of a supportive educational context. He asserted that students' well-being, choices, thoughts, and behaviors are all impacted not only by what they learn, but also by the context of their school classroom. In his words, "A community not only preserves and nourishes the individuals who compose it but also underscores the relationships among these individuals" (p. 107). Therefore, a feeling of community supports the individual members and fosters the development of critical positive relationships among them. Kohn believes that it is necessary to establish a caring environment along with a meaningful, engaging curriculum and regular opportunities for students to participate in the educational experience. If these characteristics are present in the classroom, students will be able to make meaningful choices about their learning process.

The process of building a community within the classroom revolves around creating a sense of safety on four levels. First, it is critical to foster relationships between the students and adults. Children are more likely to care about others if they themselves feel as if they are cared for by others. Second, children need to experience positive relationships with their peers. An important way to facilitate these relationships is by providing cooperative learning experiences for students throughout the school day. Third, classroom and schoolwide activities should be employed as a means through which students and adults are allowed to reflect upon their experience at the school and share those reflections with one another. Finally, academic instruction should be used as a way to incorporate community building activities and cooperative learning throughout the children's educational experience (Kohn, 1996).

In order to employ the strategies just mentioned, Kohn (1996) described three important prerequisites for building a community. He pointed out that a community is built over *time*, with an *appropriate size* of individuals (i.e., within a school that is not overcrowded), and includes staff who feel connected to one another as an *adult community*. Furthermore, two important ideas of Kohn's community-building philosophy are related to competition and discipline. He asserted that competition within schools acts to break down a community, and therefore, it should not be integrated into the students' daily activities. Kohn believes that we also need to move beyond traditional definitions of discipline and instead focus on community building.

Kohn's (1996) ideas, although valuable for understanding how to build community within schools, have not been systematically evaluated. This is somewhat due to the fact that his concepts are not intended to comprise a particular programmatic framework that can be subjected to evaluation. However, Kohn (personal communication, August 8, 2005) has informally received many narrative reports that support the utilization of his ideas and suggest positive benefits within schools that employ his strategies. Therefore, Kohn's work serves as a heuristic for understanding important aspects of community building within schools and can help guide the implementation of these strategies.

The Search Institute's 40 Developmental Assets

The Search Institute (2004) developed a list of 40 developmental assets which are defined as "positive factors in young people, families, communities, schools, and other settings that have been found to be important in promoting young people's healthy development" (p. 2). The assets are grouped into two major types: external and internal. The four categories of external assets include support, empowerment, boundaries and expectations, and constructive use of time. The four groupings of internal assets encompass commitment to learning, positive values, social competencies, and positive identity. When youth possess these assets, they are less likely to engage in alcohol, tobacco, and other drug (ATOD) use regardless of their socioeconomic, family, or racial/ethnic characteristics. The more assets that are present in a particular child, the less likely he or she is to engage in any ATOD use. Furthermore,

developmental assets are beneficial to the healthy development of youth whether a risk is present in their environment (Search Institute, 2004).

It is important to note that some of the Search Institute's (2003, 2004) 40 developmental assets are particularly related to school. For example, a "caring school climate" is one example of an external asset that provides support for youth. "School boundaries" and "adult role models" are other external assets that can be fostered within the school context. Furthermore, "school engagement" and "school bonding" are listed as internal assets as well as "caring." These characteristics can be fostered within the school environment to promote the well-being of students.

It is recommended that strategies and programs should be designed to specifically foster the developmental assets within all youth in order to contribute to their healthy growth and development. In addition to lowering the chance that youth will engage in ATOD use, the Search Institute reports that the developmental assets have shown positive benefits for youth in other ways. For example, they report that those youth who possess more developmental assets show a decrease in problematic behaviors in school, violence, antisocial behavior, gambling, eating disorders, and depression (Search Institute, 2004).

Along with the promotion of developmental assets, the Search Institute (2004) calls for building community collaborations in order to facilitate the positive, healthy development of youth and prevention efforts aimed at ATOD use. A model for community capacity building is presented that includes first fostering community dedication and efforts focused on building a community. This involves deciding on a "shared vision" as well as a "common purpose and commitment." Next is the establishment of an organizing community structure that will support positive asset building. Finally, the community engages in capacity-building strategies that give both adults and youth opportunities to be actively involved (Search Institute, 2004).

Multiple investigations conducted by the Search Institute (2003, 2004) have shown strong positive relationships between the levels of developmental assets of youth and their school attendance and grades. Recent research has provided stronger evidence because it examines the relationships between developmental assets and actual student grade reports as opposed to relying on self-reports. For example, a longitudinal study was conducted that examined youth from grades six to eight and again from grades ten to twelve. The most prominent finding indicated that the more assets youth possessed, the higher their overall GPA. This finding held true even three years later (Search Institute, 2003). Furthermore, research has also looked at the link between developmental assets and ATOD behaviors. After examining a large dataset of youth in grades 6 through 12, the results are summed up as follows. First, the more assets youth possess, the less likely they are to engage in ATOD use. Second, possessing developmental assets decreases the likelihood of engaging in all types of ATOD use. Third, developmental assets are beneficial across diverse youth. Fourth, youth who have more developmental assets show a delayed ATOD onset. Sixth, developmental assets are more closely linked to ATOD use than demographic factors. Seventh, assets are involved in other positive outcomes for youth, such as academic success and maintenance of good health. Finally, possessing certain assets, including boundaries and expectations, are particularly related to ATOD prevention (Search Institute, 2004).

The findings that support the importance of possessing developmental assets in youth clearly have been linked to positive outcomes. Because several of the assets are directly related to a sense of caring school community, this area of research justifies attention from educators. However, there are some limitations to keep in mind when interpreting these results. The primary issue is the lack of diverse samples of youth that have been used in these studies. The Search Institute (2003) reports that sample sizes for racial and ethnic minority youth are too small in their longitudinal samples to make strong conclusions. In conducting future research, it will be critical to examine larger numbers of students of color and determine how developmental assets impact their well-being.

Child Development Project

The Child Development Project (CDP) began approximately 25 years ago, and it is described as a comprehensive improvement program designed primarily for elementary schools. It attempts to increase academic, ethical, emotional, and social learning and includes community building as a key component. By building a community, the groundwork is laid for implementing strategies that help students becoming caring, prosocial individuals (Schaps et al., 2004).

The CDP attempts to create

> caring communities of learners—environments that are characterized by caring and supportive relationships, and collaboration among students, staff, and parents; a sense of common purpose and a clear commitment to salient norms and values of caring, justice, responsibility, and learning; responsiveness to students' developmental and sociocultural needs; an accessible, meaningful and engaging curriculum; and opportunities for students to meaningfully participate in decision-making and otherwise be actively involved in the intellectual and social life of the classroom and school. (Battistich et al., 2004, p. 244)

The creation of this type of school community is greatly influenced by certain strategies utilized by teachers, including warmth and supportiveness; a promotion of cooperation; elicitation of student thinking and discussion; emphasis on prosocial values; and low use of extrinsic control. Students should also be given regular opportunities to work collaboratively with their peers toward shared goals; assist others in a meaningful way when needed and vice versa; participate in discussions that help them to develop empathy; reflect on how one's behavioral choices contribute to the development of "prosocial values"; learn and implement behaviors and words that demonstrate appropriate social skills; and demonstrate an appropriate level of independence within the classroom while actively taking part in decision making and establishing the classroom context (Battistich et al., 1997).

In contrast to some types of programs that are implemented within schools, the CDP places an emphasis on the "promotion" of healthy growth and development of *all* children rather than the "prevention" of problems in only those children who are identified as at risk (Battistich et al., 2004). These authors, along with others, believe that a sense of school as community serves as a critical lens through which the context of education can be examined. By using this lens, educators will be able to better understand and to more fully meet the needs of all individuals within the school. Furthermore, they propose that students' needs are most likely to be met when they feel connected to their environment and identify with the values of school (Battistich et al., 1997). Since the CDP was originally developed and introduced in 1980, the community-building element has been developed into its own program called "Caring School Community" or CSC. The CSC program focuses on facilitating an environment of caring by fostering positive relationships between youth, adults, and families (Developmental Studies Center, 2005).

The Child Development Project is based on a great deal of research that has been done over the past 15 years with a diverse sample of youth in various elementary schools in the United States (Battistich et al., 1997). Multiple schools have implemented the CDP, and numerous studies have been conducted to determine the effectiveness of the program as well as to search for areas of improvement. The findings have suggested positive results in youth where the CDP was implemented. For example, Battistich, Schaps, Watson, and Solomon (1996) examined the impact of the CDP that was implemented in elementary schools from six school districts around the United States. Over the course of a three-year period, the authors reported that those students in the CDP program showed significant decreases in drug use and delinquency compared with their peers in non-CDP schools. In another study, Battistich et al. (1997) reported that elementary students who participated in a CDP school had a greater sense of community than students in comparison schools. In addition, the authors suggested that the positive benefits of improving school community may be greatest for economically disadvantaged students. In an examination of third- through sixth-grade students in CDP schools, Solomon et al. (2000) found that the youth exhibited gains in personal, social, and ethical attitudes, values, and motives. Furthermore, the authors noted that a sense of school community was found to be a significant mediating variable for nearly all of the dependent variables, illustrating that the CDP resulted in positive effects only to the extent that it was able to establish a caring community within the school. Battistich et al. (2004) conducted a follow-up to an earlier study with middle school students who were first exposed to the CDP in elementary school. Overall, the authors reported that CDP students were more involved in and had greater dedication to school, were more "prosocial," and were involved in fewer problem behaviors than comparison youth.

Schaps et al. (2004) summed up the findings from research on CDP schools over the years by noting that the children who participated in CDP schools exhibited an increased sense of community at school, which enhanced their academic motivation and goals, fostered the development of positive character traits, facilitated social and emotional learning, and decreased the number of behavior problems. Furthermore, many of these benefits lasted through middle school and produced positive effects on academic success (although they did not consistently produce academic gains in elementary school). The positive results of the CDP have led it to be recognized as a model program by which to pattern effective youth programs. For example, the Substance Abuse and Mental Health Services Administration (SAMHSA) has named the CDP a "Model Program" for reducing high-risk behaviors (U.S. Department of Health and Human Services, SAMHSA, Center for Substance Abuse Prevention, 2005). The Promising Practices Network (2005) on Children, Families, and Communities named the CDP as one of several "Programs that Work" for promoting positive youth outcomes. Finally, the Caring School Community Program (the community-building element of the CDP) was listed as a "Promising Program" by the U.S. Department of Education's (2001) Safe, Disciplined, and Drug-Free Schools Expert Panel.

The amount of research that has gone into the creation and refinement of the CDP is quite impressive and has produced many positive results. However, one limitation is the fact that the CDP does little to address a sense of community among adults, which is an important issue to address in future research (Battistich et al., 1997). Furthermore, future research that looks specifically at the CSC

program, the community-building program of the CDP, would add further knowledge about the direct impact of the curriculum upon youth.

Invitational Theory of Practice

The previous frameworks provide valuable insight into how one can begin to conceptualize a "caring school community" and what kinds of strategies are implemented to foster this environment. However, at this point, it is also important to ask the question: Where do *school counselors* fit into the caring community-building process? These frameworks do not include an explicit discussion as to how school counselors are involved in the process of community building. Instead, the roles of other educators, such as teachers and principals, are often emphasized. Although these are equally important discussions, this area of work would be strengthened by additional conversations about the school counselor's role in creating a caring school community, particularly in light of the changing role that the school counselor has faced over the years. While it is important to note that the previous philosophies *do* mention the importance of including the entire school staff within the community-building process, which includes the school counselor, it still remains difficult to ascertain his or her specific role within this process. To being the conversation concerning the school counselor's role in creating a caring community, we will now examine a sixth framework, the Invitational Theory of Practice (ITOP), which provides more explicit guidance on how a school counselor can be involved in the creation and maintenance of a caring school community.

The ITOP is a framework that has self-concept as its foundation and integrates other relevant theories and strategies to create a model for human development. ITOP reflects four primary assumptions that can be utilized within a counseling relationship. First, individuals are able-bodied, valuable, and self-directed beings and should be treated accordingly. Second, the nature of the helping process is a cooperative, collaborative alliance. Third, each individual has an "untapped potential" that exists across each stage of development. Fourth, in order to realize this potential, there need to be individuals and conditions that facilitate its development. School counselors who utilize this approach use optimism, respect, trust, and intentionality in the helping process. Furthermore, there is an acknowledgement that each individual's functioning occurs on one of four levels: intentionally disinviting, unintentionally disinviting, unintentionally inviting, and intentionally inviting (Purkey & Schmidt, 1996).

Stanley et al. (2004) extended the ITOP framework to the establishment of a safe school environment where youth could experience academic success. It took on a holistic, schoolwide perspective, emphasizing the importance of considering the entire school context. The authors wrote, "The four elements of ITOP—respect, trust, optimism, and intentionality—provide a constant 'stance' or conceptual framework from which school counselors and others can effectively create and maintain a truly safe and welcoming academic environment" (p. 304). These elements of ITOP serve as a conceptual framework that strives to address the overall atmosphere of the school, attempting to make it a positive and rewarding environment for students, school staff, family, and community members. The authors noted that the ITOP philosophy could be used as a guiding force by which to meet the established goals of the school. It emphasizes the school counselor working in multiple collaborative relationships with students, staff, and family (Stanley et al.).

ITOP posits that each individual operates at one of four different patterns of communication (i.e., intentionally disinviting, unintentionally disinviting, unintentionally inviting, and intentionally inviting) at any given point in time (Purkey & Schmidt, 1996). School counselors can help individuals understand these different communication processes and educate them about what kinds of communication strategies are most effective. Furthermore, ITOP includes the "Five Ps" (i.e., people, places, policies, programs, and processes) that provide the means by which school counselors can implement ITOP. For example, counselors can address *people* by facilitating after-school training sessions for staff to promote positive listening skills, handling challenging situations, building intentional communication skills, and role-playing situations that arise in working with students. School counselors can address *places* by giving attention to the physical environment and to how to make it as attractive and welcoming as possible. The school counselor can be involved in school *policies* by ensuring that they reflect the values that are promoted by the school. School counselors can influence *programs* by ensuring that they are truly beneficial for students. For example, those that attach labels to students and are not inclusive can have many negative effects. Therefore, school counselors can advocate for programs that promote student strengths and allow them opportunities to participate in the larger school community. Finally, the school counselor can recognize how he or she is part of educational processes through his or her interactions with each person and each thing within the school, and the degree to which these interactions contribute to the establishment of an overall positive atmosphere. Together these strategies help the school counselor "to transform the total school culture by applying steady and continuous pressure from numerous sources over time, much like the starfish conquers oysters" (Stanley et al., 2004, p. 305).

The ITOP framework is helpful to the field of school counseling because it includes the role of the school counselor in the discussion of creating caring school communities. Suggestions are made about how the counselor can begin to foster a sense of community within his or her school. Purkey and Aspy (2003) described how ITOP was implemented in the nine lowest performing schools within a large, inner-city district. After physical renovations were made and new staff was hired at the schools, the starfish analogy of this framework was presented to the staff at these schools. Specific strategies were implemented at the five levels that are critical to this approach (i.e., people, places, policies, programs, and processes). At the end of the school year, preliminary findings suggested that all schools showed improvement in test scores. Furthermore, three of the nine schools were categorized as "exemplary" because district reading and math scores were met or exceeded. These findings provided positive support for the ITOP process, and in the words of the authors, invitational education can "effectively create and maintain healthy school environments" (Purkey & Aspy, 2003, p. 154). However, this area needs further empirical investigation and exploration into how other areas of concern (e.g., emotional, social, and behavioral well-being) are impacted because of utilizing the ITOP model.

Although most of the frameworks reviewed here do not explicitly include a discussion about the school counselor's role in facilitating caring school communities, they are valuable conceptualizations that shed light on what community building actually looks like within a school. Together, the strategies that are illustrated within these philosophies can be extended to the school counselor, which will be addressed in more detail later in this discussion. It is hoped that gaining an understanding of all six of these approaches will help to illustrate more fully that community building occurs in multiple ways using different strategies. Even though differences exist among these philosophies, each works toward a similar outcome: a caring school community. Furthermore, each will help to more fully understand how and in what ways the school counselor's role can be conceptualized to include community building.

Commonalities Among the Frameworks

After reviewing the six selected theoretical frameworks, it is helpful to analyze the components of these various frameworks and reflect upon the commonalities and differences that emerge. The elements of a successful school community that are described by Rossi and Stringfield (1996), reviewed earlier, provide a meaningful structure by which to compare the tenets of these various frameworks (see Table 24.1).

As evidenced by the table, each of these philosophies fosters the critical components of a successful school community as proposed by the Rossi and Stringfield (1996). A primary commonality between all of these frameworks is the focus on the school *environment* as a way in which to create a more positive learning experience for youth. This focus is highlighted in the shared vision, purpose, and values that are key to each perspective. All six also address multiple aspects of diversity and culture, including the celebration of culture and the consideration of cultural factors on the educational experience of youth. Each perspective calls for the effective participation and communication among multiple individuals (e.g., students, school staff, families, and community) when engaging in efforts of community building. Caring, trust, and teamwork are clearly included in each perspective either directly or indirectly in program implementation. Finally, each of the six theoretical frameworks emphasizes the need to respect and recognize the uniqueness of each individual.

Although all six perspectives foster the critical elements of successful communities, they do also differ. One major difference is the level of program implementation. For example, some programs focus more specifically on building community within the classroom (e.g., Frank's, Kohn's, CDP) while others take a more school-wide approach (e.g., Tribes, ITOP, Search Institute). A second difference is the amount of empirical support that is available in the literature. For example, of the six perspectives discussed here, the CDP enjoys the most empirical support and has been nationally recognized as a model program. The Search Institute has also made quite an effort to evaluate their model of developmental assets within schools and is attempting to conduct future research with more diverse samples of youth. Their work, however, is not focused on evaluating specific programs or interventions. The well-defined Tribes program has been implemented in many schools around the country, and support for the program is promising (Chesswas et al., 2003; Chesswas & Davis Sosenko, 2004). The ITOP will benefit from future research that supports the utilization of this model and how it is appropriate to guide school counseling practices. Frank's and Kohn's theoretical frameworks lack empirical support at this time, but nevertheless, they do contribute valuable ideas to the topic of school community building.

The School Counselor's Role in Building Caring School Communities

These six frameworks provide a foundation for understanding multiple approaches aimed at building caring communities in schools. They also provide guidance for how the school counselor can play a role in this process. The next

Table 24.1 Rossi and Stringfield's (1996) Elements of Successful School Communities (1996)

	Shared Vision, Shared Purpose, and Shared Values	Incorporation of Diversity	Communication and Participation	Caring, Trust, and Teamwork	Respect and Recognition
Tribes (Gibbs, 2001)	–Goal: "[T]o engage all teachers, administrators, students, and families in working together as a learning community that is dedicated to caring and support, active participation, and positive expectations for all students" (Gibbs, 2001, p. 22). –Four agreements: Attentive Listening, Appreciations/No Put Downs, Right to Pass, Mutual Respect	–Culturally appropriate strategies –Organized into diverse Tribes –Values uniqueness of each individual –Considers impact of cultural factors on student's well-being (e g., family, community, friends)	–Reflect on and share own experiences, creating inclusion –Involve family, schools, and community using a democratic process –Student-centered classroom allows students to have active participatory role	–Teachers work collaboratively in groups –Educators, parents, and students work together –Caring and support is critical –Promote collaboration –Foster connection and belonging	–Respect diversity –Inclusion so that each member feels valued
Laurie Frank's (2004) "The Caring Classroom"	–"Full-value contract" describes group agreements –Each individual has a responsibility to contribute to the safety of the environment –"Goal-Setting" helps establish & understand group and individual goals	–Inclusion allows diverse individuals to be valued within the community	–Participation is valued: It is "OK" to make mistakes and take risks –Problem solving takes place at Stage 3 –Effective communication –"Challenge by Choice" gives individuals ownership about their individual participation	–Collaboration and cooperation are emphasized –Cooperative learning takes place at Step 1 –Establishes safety –Active listening and perspective-taking –Trust is created at Step 2 –Empathy –Community support	–Value and respect for each individual –"Put-ups" rather than "Put-downs" –Consistent encouragement –Challenge takes place at Step 4 (recognize individual goals)
Alfie Kohn's (1996) "The Classroom as Community"	–Take steps to establish the classroom as a physically and emotionally safe context for all individuals –Moving beyond discipline and competition to focus on community-building	–Focus on context and the factors that contribute to a safe, successful school environment	–Frequent opportunities for participation and engagement –Open dialogues about experiences within the school	–Continuously show caring for one another –Foster sense of connection among individuals –Supportive context –Build positive relationships –Caring environment –Community-building activities within the classroom	–Demonstrate supportive and caring attitudes toward youth and adults

Search Institute (2004)	–Strategies and programs should be designed to specifically foster developmental assets within all youth –Establish a "shared vision" along with a "common purpose and commitment"	–Consideration of multiple contextual/ cultural factors that impact the development of youth –Focus on "assets," or strengths of each individual –Community capacity building	–School engagement –Building community collaborations –Active involvement of school, family, and community –Involve both adults and youth	–Establishment of a caring school climate –Caring	–Recognize that each individual has a unique set of developmental assets
CDP (Battistich et al., 1997; Battistich et al., 2004; Developmental Studies Center, 2005; Schaps et al., 2004)	–Create a "caring community of learners" –Community-building is key –Shared sense of purpose and common norms and values of caring, justice, responsibility, and learning	–Responsiveness to youth's diverse developmental and sociocultural needs –Promote development of all students rather than prevent problems in those identified as "at risk"	–Accessible, meaningful, engaging curriculum –Opportunities to participate meaningfully –Active role in decision-making process	–Facilitate development of caring, prosocial individuals –Caring and supportive relationships –Collaboration –Shared decision-making process –Teacher warmth and supportiveness	–Low use of extrinsic control –Recognize when help is needed and assist others –Empathy
ITOP (Parkey & Schmidt, 1996)	–Four primary assumptions: Individuals are able-bodied and valuable; helping process is collaborative alliance; each individual has "untapped potential"; strategies are implemented to promote one's "untapped potential"	–Address multiple contextual factors of the school in order to make it positive for students, adults, parents, and community	–Various levels of communication are utilized by individuals –Collaboration among school staff, students, parents, and community	–Trust and intentionality –Safe and welcoming environment	–Respect and optimism

part of the chapter will begin by considering the role of the school counselor in general, followed by a reflection on how the Positive Youth Development (PYD) perspective is a suitable framework from which to approach community building. Next, specific strategies that the counselor can utilize in the community-building process will be presented.

The Redefined Role of the School Counselor

In recent years, the American School Counselor Association (ASCA) has attempted to clarify the school counselor's role and emphasize his or her importance as an integral member of the school. The *ASCA National Model* (ASCA, 2003) is an attempt to describe how youth are positively affected by the school counselor and the multiple roles that the school counselor plays in an attempt to facilitate healthy youth development. The model defines the school counseling program as an essential component that contributes to the successful functioning of the school. It also emphasizes that *each* student is given equal access to the services provided by the school counselor, and the guidance curriculum in turn is designed to teach *all* students the appropriate knowledge and skills that they need in order to be successful individuals. Therefore, the school counseling program is defined as "comprehensive" in the sense that it is designed to reach all students in order to promote their academic, career, and personal/social development (ASCA). This perspective is in contrast to previous definitions of the school counselor, which described the counselor as working primarily with a subset of students, such as those identified as "talented and gifted," "at risk," or "with special needs." Within the literature on school counseling, it is clear that many authors embrace the redefinition of school counselors and call for their active facilitation of collaborative relationships and fostering a sense of community within the school as an integral part of this redefined role (e.g., Beale & McCay, 2001; Hernandez & Seem, 2004; Holcomb-McCoy, 2004; Keys & Lockhart, 1999).

This redefinition of school counseling that includes a shift from working with only a portion of the school population to providing services to all students is one that fits in well with the idea of creating a caring school community. Both call for the school counselor to address *all* students and provide *each* student with the knowledge and skills that needed to experience a healthy developmental process. Furthermore, both the ASCA definition of the school counselor and the process of building caring communities require the counselor to be *fully integrated* into the educational environment rather than functioning as an ancillary set of services.

Using a Positive Youth Development Perspective

In the past, programs for youth in our society were developed to address the negative behaviors that were exhibited by children who were labeled "at risk." This deficit approach targeted at-risk youth and attempted to "fix" them by decreasing these negative behaviors. However, beginning in the 1980s, research began to show that this strategy was not effective because it narrowly focused on specific problems (e.g., drug abuse, violence, or teen pregnancy) and failed to address the important elements of *healthy youth development*. In response to these findings, the focus of youth programs shifted to a resiliency approach that addressed what *all* children need to be successful and experience a healthy developmental process (Community Network for Youth Development, 2001). This shift is reflected in Damon's (2004) description of PYD: "The positive youth development approach aims at understanding, educating, and engaging children in productive activities rather than correcting, curing, or treating them for maladaptive tendencies or so-called disabilities" (p. 15). Furthermore, the importance of considering the impact of environmental factors (e.g., family, school) on the development of youth became apparent (Catalano, Berglund, Ryan, Lonczak, & Hawkins, 2002).

This change in thinking resulted in the emergence of PYD, which was a shift away from the intervention perspective that had formerly been promoted. Advocates of a PYD approach over an intervention focus argued that efforts aimed at youth cannot simply intervene with existing problem behaviors, but must also facilitate the development of positive characteristics as well (Catalano et al., 2002). An ecological perspective that considers contextual factors (e.g., Bronfenbrenner, 1979) was also included within the PYD approach as well as developmental components which highlighted the fact that certain competencies must be gained at particular stages of life (Catalano et al.).

Catalano et al. (2002), in an attempt to create a better definition of PYD, reviewed the PYD literature and identified 10 common goals that PYD programs have in common: facilitate bonding; increase resiliency; foster social, emotional, cognitive, behavioral, and moral development; build self-determination; foster spirituality; build self-efficacy; promote positive identity; promote positive belief in the future; recognize positive behavior and activities that allow for prosocial development; and build prosocial norms. Different programs included a different combination of the ten objectives; however, all programs tried to improve social, emotional, cognitive, and/or behavioral competencies; self-efficacy; and prosocial norms/family and community standards for healthy social and personal

behavior. The authors also showed that PYD programs targeted one or more of three critical contexts: school, family, and community. Of the programs reviewed, 88% included a school component. Those programs that were most effective used a manual or curriculum to deliver the program and were in place for a period of at least nine months. The authors report that each program reviewed reported significant changes in youth's positive or problematic behaviors. These are preliminary findings on programs that utilize the PYD framework and warrant future research that evaluates program outcomes.

Utilizing a PYD perspective is appropriate for school counselors, given their redefined role to become more integral in supporting the well-being of students. When considering the PYD approach within the broader discussion of developmental guidance and, more specifically, in the creation of a caring school community, there are several parallels that are important to highlight in an attempt to understand the commonalities among the three. First, each is directed toward *all* students and promotes their positive well-being. Second, each considers the multiple contextual factors that impact youth and addresses the critical contexts of school, family, and community. Finally, all recognize the importance of using a developmental perspective in order to promote the acquisition of skills and knowledge at the appropriate stages in the developmental process. Although the ASCA calls for a developmental program that is "proactive and preventive in focus" (Campbell & Dahir, 1997, p. 9), it seems more appropriate to approach the process of creating a caring school community from a PYD perspective. The preceding commonalities that are evident among a PYD perspective and a developmental guidance program in general and, more specifically, creating a caring school community in particular, seem to make it a likely perspective from which a school counselor can guide his or her work within a school.

The school counselor has an exciting and critical role within the school. Using a PYD perspective, he or she is in the position to equip youth with the awareness, knowledge, and skills that will help them to become healthy and successful individuals. Unlike other school staff members, the school counselor is in a position that allows him or her to reach out to and establish him or herself as a positive source of support for all students within the school. Using the PYD perspective, the school counselor is fortunate to operate from a perspective that allows him or her to work not only with students but also with school staff, families, and community members in creating supportive relationships that promote the positive development of youth. The school counselor is truly an individual who can take initiative in creating a sense of community and establish him or herself at the "hub" of this process.

Building Caring School Communities on Five Levels

So far in this chapter we have laid a foundation that clarifies the nature of caring school communities and describes a select group of theories that show how to facilitate community building. Furthermore, a rationale as to why the counselor is well suited to play a key role in fostering caring communities within a PYD perspective has been articulated. This discussion will now turn to the more explicit ways in which the counselor can implement strategies on five levels within the school using individual and group counseling, classroom guidance lessons, staff consultation and collaboration, schoolwide initiatives, and community outreach and partnerships. Many of the strategies suggested by the six philosophies presented earlier in this discussion will be integrated into approaches described here that are specific to the school counselor's role in creating a caring community.

Individual and group counseling. School counselors can utilize their counseling relationships with students as opportunities to foster a sense of connection to the greater school community. For example, counselors can facilitate discussions about topics such as school success, anger management, relationship difficulties, dealing with bullying behavior, and coping skills as suggested by the ITOP framework (Stanley et al., 2004). Students who are in counseling because they are struggling with one of these critical areas of development will be able to discuss their feelings and experiences within the safe context of the counseling sessions. These opportunities can serve as crucial moments by which to facilitate the healthy growth and development of students who need support dealing with specific issues. In addition, counselors can use individual and group counseling sessions as opportunities to reflect on and share their experiences within the school environment, as suggested by Tribes (Gibbs, 2001), to address issues of diversity and other aspects related to the well-being of students.

Individual and group counseling sessions can also be utilized as opportunities to create more of a sense of inclusion among students. For example, individual and group counseling sessions can be a safe context in which to discuss diversity issues (Bradley & Jarchow, 1998). Students who are struggling with feeling a part of the community due to racial/ethnic, socioeconomic, religious, sexual orientation, or other cultural differences can benefit from discussions with the school counselor about this experience and ways in which to cope. On the other hand, students who seem to have a difficult time embracing diversity might benefit from discussions led by the counselor that help them understand the importance of respecting cul-

tures that are different from their own. Small groups might also be used to discuss career development issues for ethnic minority youth, including conflicts, questions, and challenges that they might be facing as they consider their future educational and career choices (Constantine, Erickson, Banks, & Timberlake, 1998). Addressing these concerns for racial and ethnic minority youth might help them to feel as if their needs are being more fully addressed within the school environment. Other youth who might initially feel disconnected from the school community are new students. One way to create a sense of connection to the school is by creating a "new student group," headed by the school counselor, as a way to help these students feel welcomed into the school (Bradley & Jarchow, 1998). The counselor can help familiarize the students with the school community, help them discuss their experiences in the new school environment, and ensure that their needs are being met.

Counselors can also serve as liaisons to connect youth to supportive programs and resources. For example, after-school academic support programs and peer mentoring programs are two helpful environments that can meet the needs of students and help them to feel more connected to school (Stanley et al., 2004). Through individual and group counseling sessions, counselors will be able to identify those students who would benefit from programs such as these and help them to become involved. Furthermore, counselors should have books and other resources available to students on issues such as diversity (Bradley & Jarchow, 1998) and other important topics related to youth development that will help students to feel better about themselves and their membership in the larger school environment.

Classroom guidance. In order to establish a sense of a caring community during classroom guidance lessons, school counselors can employ the many techniques that are suggested by previously reviewed theories. For example, school counselors can follow the Tribes approach of structuring the classroom, ensuring that the lessons are organized in such a way that promotes a student-centered environment (Gibbs, 2001) where there is ample opportunity for students to work in groups (Battistich et al., 1997; Frank, 2004; Gibbs). Constantine et al. (1998) also promoted student collaboration in the use of career development activities in the classroom, which have the potential to increase self-esteem, academic achievement, and retention of at-risk youth. As suggested by both Gibbs and Frank, the counselor could model and encourage the use of "appreciations" or "put-ups" while discouraging "put-downs." He or she could make a conscious effort to design curriculum that is truly engaging and meaningful, as emphasized by the CDP (Battistich et al., 2004) and Kohn (1996). Finally, school counselors could be cognizant of displaying warmth and supportiveness, using techniques to elicit thinking and discussion, emphasizing prosocial values, and using a low level of extrinsic control, which is related to the students' feelings of a sense of community within the classroom (Battistich et al., 1997; Solomon et al., 1997). Instead of attempting to exert control over students, the counselor should focus on how he or she could help to empower students so that they would be able to develop and exhibit self-control (Sautner, 2001).

One important topic for school counselors to address in classroom guidance lessons is diversity. Lessons can be designed to specifically create a space for students to discuss this topic, and counselors can target ways in which to reduce prejudice and stereotyping within the classroom. These lessons will allow students to learn to understand and respect the worldviews of others (Bradley & Jarchow, 1998). Also, counselors could be conscious about using culturally appropriate teaching methods within the classroom, as proposed in the Tribes philosophy (Gibbs, 2001). By demonstrating and teaching respect for diversity, it is hoped that students of diverse backgrounds will feel appreciated and supported within the school environment. Furthermore, adults should serve as role models for youth by embracing and celebrating diversity.

Staff consultation and collaboration. A major role that school counselors have when working with staff is the role of consultant. Because of his or her training, skills, and knowledge, the school counselor is in a desirable position to facilitate after-school or in-service training sessions for staff. Through these activities, counselors can educate their colleagues on topics such as positive listening skills, handling challenging situations, and building intentional communication skills. Furthermore, they can engage staff in role-playing situations that may come up with their students (Stanley et al., 2004). These opportunities not only help teach school staff the strategies that create a sense of community within their classrooms, but are also skills that can be used when interacting with other staff members, parents, and community members in effective ways.

Strategies that the counselor uses within the classroom to establish community can also be taught to teachers. These strategies include establishing the physical environment to promote collaborative learning (Gibbs, 2001); promoting collaborative learning experiences (Battistich et al., 1997; Frank, 2004; Gibbs); using "appreciations" or "put-ups" and discouraging "put-downs" (Frank; Gibbs); designing meaningful, engaging curriculum (Battistich et al., 2004; Kohn, 1996); using culturally appropriate teaching strategies (Gibbs); and helping teachers learn how to show warmth and supportiveness, techniques that elicit student thinking and discussion, prosocial values, and a low level

of extrinsic control (Battistich et al., 1997). Counselors can educate staff about the Search Institute's (2004) developmental assets and help them understand how they can promote these assets within students.

In accordance with Kohn's (1996) philosophy, counselors can help other staff move away from promoting competition among students and using discipline strategies and, instead, toward the celebration of participation and community building. He or she can utilize Kohn's steps in creating a safe environment within classrooms as a way for educators to conceptualize how this process looks, which involves thinking in the plural as "us" rather than individualistically.

Counselors can also help facilitate a discussion with school administrators, teachers, and other school staff to reflect upon the shared values of the school (Stanley et al., 2004). Because the shared values of a community are so core to its success, it is important to ensure that this set of values is appropriate, agreed upon by the members of the school, inclusive, and promoted within the school. In order for these values to be shared by the students, the adults must appropriately model these values and continually reinforce them throughout the school year. Likewise, school counselors can also facilitate an examination of the various programs that are offered by the school. Those that attach labels to students and are not inclusive can have many negative effects on the school as a community (Stanley et al.).

Due to the increasing diversity in our country, the schools in the United States are becoming much more diverse and we are more in touch with global events which affect our everyday lives. As a result, both school staff and students need to gain the knowledge and the skills to successfully navigate within a diverse world. Counselors can collaborate with teachers to promote not only a classroom that is global, but also one that celebrates diversity. Staff trainings or workshops can be organized and facilitated by the counselor in an effort to teach staff about diversity and facilitate an open dialogue so that staff members can openly discuss this issue (Bradley & Jarchow, 1998). It is critical that these discussions embrace a broad definition of diversity that includes not only race and ethnicity, but all aspects of culture such as gender, socioeconomic status, sexual orientation, religion, immigration status, ability, and language.

Finally, school counselors can develop programs that foster a sense of community among staff and between staff and students. For example, he or she can coordinate a staff wellness program or implement a mentoring program that connects staff with students in need of positive role modesl (Stanley et al., 2004). These types of efforts highlight the importance of including the adult staff in the community-building process.

Schoolwide initiatives. School counselors can begin to address the school community on a whole-school level by giving attention to its physical environment and ensure that it is as attractive and welcoming as possible to all individuals within the school (Stanley et al., 2004). This might include paying particular attention to posters, banners, and pictures that are visible within the school context and making certain that they are truly characteristics of an environment that promote a sense of community.

It is clear that any successful community needs a shared set of values. School counselors can play a key role in helping to identify that set of values and connect it to the mission of the school. For example, the four "agreements" that are core to the Tribes (Gibbs, 2001) philosophy serve as a unifying set of values that all members are continually encouraged to uphold. School counselors can then help to articulate and promote these values, such as caring, respect, and responsibility, in a proactive manner through character education programs, for example (Britzman, 2005). The counselor can also collaborate with staff members to promote the shared values in a coherent, schoolwide manner. For example, the school could promote a particular value or idea related to a value promoted within the school on a monthly basis so that students consistently receive messages about these values.

A school counselor can also help facilitate a caring school community by consciously establishing him or herself as what C. C. Lee (2001) defined as a "culturally responsive counselor" who is a "facilitator of student development" (p. 258). By being culturally responsive, the counselor recognizes that each student has the desire and the ability to learn and acknowledges that cultural differences do exist. C. C. Lee described the importance of understanding the "cultural realities" of youth and how they affect their development on academic, personal/social, and career levels. By doing so, C. C. Lee explained that the counselor has five responsibilities for each student: facilitate positive self-identity, promote positive relationships between students of diverse backgrounds, promote academic achievement of students, promote attitudes and skills for success in school, and help youth explore career options and promote career development by considering the multiple factors that influence career development of racial/ethnic minority students. When counselors are culturally competent in these ways, they demonstrate an appreciation for diversity and an understanding of the multiple factors that influence the development of racial/ethnic minority children.

Another way in which to promote a sense of community at this level is by coordinating schoolwide connectedness-building activities in collaboration with other staff members (Holcomb-McCoy, 2004), such as schoolwide assemblies (Stanley et al., 2004). These activities will give the school a chance to celebrate its school community as a whole and

emphasize those components that are most important to the school environment, such as the shared value system.

School counselors can also serve as leaders in school reform efforts that are related to caring-community building. For example, he or she might ensure that educational goals are met and that the whole school is, in fact, promoting a safe environment (Bemak, 2000). Counselors can help, for example, review school policies with other staff members to make certain that the policies do support and reflect the values of a caring school (Stanley et al., 2004). Another way to assess the ways in which the school community as a whole is perceived by both staff and students is to administer a climate survey. The school counselor can take a leadership role in the administration and interpretation of the survey (Hernandez & Seem, 2004). By gaining a sense of the school climate and what specific areas need to be addressed, the counselor can gain insight into the sense of school community that exists and what kinds of efforts can be introduced to improve that sense of community.

One way in which the school counselor can collaborate with others to create a caring community is by providing opportunities for students to participate in caring behaviors. In order for this to take place, all staff must first make a commitment to serve as role models for positive, caring behaviors. Next, school counselors can collaborate with staff to provide students with opportunities for students to practice behaviors in an effort to create a positive school climate (Noddings, 1992). Providing opportunities for students to engage in these caring behaviors is critical for establishing a caring context that feels like a true community (Ferreira & Bosworth, 2001). This might take form in service-learning activities, a "Random Act of Kindness" week, or pairing up students with other students in mentoring or "buddy" relationships.

In thinking about the school counselor as a leader in addressing the school climate, Hernandez and Seem (2004) wrote,

> While changing a school climate is everyone's responsibility, school counselors can play a leadership role in this effort because of their specialized knowledge and training. As catalysts for a safe school, school counselors can oversee and coordinate the school community's efforts at programming, provide leadership in the assessment of such efforts, and play a key role in communicating with students, teachers, staff, administration, parents, and the community at large. While being an advocate for a safe school climate may appear overwhelming, serving as a catalyst in a school will help foster programs and policies that create a climate that reflects a community that cares about all youth. Ultimately, the school counselor's leadership role in the creation of a safe school climate will result in the academic and personal success of all students and help schools achieve their educational missions. (p. 261)

These authors' ideas highlight the importance that counselors can indeed play a leadership role in promoting and evaluating a caring school climate, but also the necessity of collaborating with other staff members in order to create change.

Community outreach and partnerships. In a study conducted by Bryan and Holcomb-McCoy (2004), school counselors across grade levels reported that their participation in school–family–community partnerships was an important part of their role as school counselors. After reviewing the literature, these authors reported that nine partnership programs were oftentimes implemented in schools: mentoring programs, parent centers, family and community members as teachers' aides, parent and community volunteer programs, home visit programs, parent education programs, school-business partnerships, parents and community members in site-based management, and tutoring programs. These types of programs facilitate the development of critical positive relationships among the school, families, and community. The school counselor can be instrumental in building these relationships that connect schools, families, students, and the larger community. Bryan (2005) discussed the three roles that school counselors could undertake in order to build collaborative relationships: team facilitator, advocate, and collaborator.

An important way to foster a sense of connection with parents to the larger school community is by making parent contacts. For example, Kohn (1996) suggested that it is important to take the time to write positive notes to parents or make phone calls that inform them not only what their child needs to improve upon but more importantly what their child is doing *well*. When possible, holding parent–counselor meetings or even making home visits allows parents to know that they are truly valued. It is also critical for the school counselor to allow parents opportunities to express their ideas and experiences so that he or she can think from the parents' point of view. Furthermore, C. C. Lee (2001, 2005) suggested that the counselor should attempt to be flexible with his or her schedule, when possible, in order to accommodate different cultural backgrounds and different family circumstances. For example, the counselor might consider periodically having evening appointments available for parents who cannot make it to school during the regular school hours. Being flexible with one's schedule and ways of interacting with parents is likely to give the impression that the counselor is willing to meet the parents "where they are" and is striving to make them feel welcomed and a part of the school community.

In working with families, community members, and organizations, the school counselor is in an ideal role to take leadership of these collaborative efforts. He or she might consider building partnerships with mental health and related agencies, for example, to establish a positive working relationship (Bemak, 2000). As a result, a school counselor is in a position to consult with mental health providers who are working with students at his or her school (provided consent is obtained) and to collaborate on interventions for students. Furthermore, counselors will develop an understanding of the services that are provided in the area and will be able to make referrals to students and their families when necessary. As a result, school counselors can work with community agencies to develop programs and services for children and families (Bemak).

When developing school–family–community partnerships, eight communication processes are included in the process: trust, flexibility, help exchange, responsive listening, individuation, group functioning, nurturance, and problem solving (Swick, 2003). Because of the experience and skills that school counselors possess in the area of communication, they serve as valuable resources for teaching the individuals involved in these partnerships about these processes of communication. Counselors can also lead educational and experiential discussions about diversity and multicultural issues with parent and community groups in order to create a safe environment in which these conversations can take place (Bradley & Jarchow, 1998).

In attempting to create community partnerships, it is helpful to have a framework from which to begin this process. The community capacity-building model provided by the Search Institute (2004) provides one set of steps from which to understand this process. The school counselor can take an initiative to educate all parties involved about how to identify and promote the strengths of the community, as well as promote a democratic decision-making process.

Implementation

To help school counselors consider the implementation process of caring-community building the next section of the chapter will address three key issues. First, a model for implementation will be articulated that will help school counselors understand how they play a central role in this continuous, interrelated process. Second, a consideration of evaluation efforts will be important to reflect upon in order to assess the impact of community-building strategies. Finally, a case example will be presented as a practical illustration that applies the ideas presented throughout this discussion to one school counselor's efforts at community building.

A Model for Implementing Strategies for Fostering a Caring School Community

One helpful way to conceptualize how a school counselor builds caring school communities is to visualize the process on a wheel. The school counselor is centered at the hub of the wheel, serving as a key individual who can facilitate and maintain caring community building on the five levels described in this discussion. Each of these levels—individual and small group counseling, classroom guidance, staff consultation and collaboration, schoolwide initiatives, and community outreach and partnerships—is contained on one of the spokes of the wheel, directly connected to the school counselor who continuously implements strategies throughout the school year to address each of these levels. Between each spoke is one of the key elements of successful school communities identified by the OERI (1996): shared vision, shared purpose, and shared values; incorporation of diversity; communication and participation; caring, trust, and teamwork; and respect and recognition. The school counselor is mindful of incorporating these elements into the caring school community–building process. As a result, when each of the five levels of implementation is addressed and each of the five elements of successful school communities is fostered, a caring school community will be created as the overarching outcome of the school counselor's efforts (in collaboration with the students, staff, families, and community). The sense of caring school community is represented as the rim on the wheel diagram that is the goal of the efforts of the school counselor, at the center of the wheel (see Figure 24.1).

The representation of community building as a wheel also represents the fact that it is a circular, continuous process. There is not necessarily a clearly outlined, step-by-step process leading to the establishment of a caring school community; rather, it is the result of a continuous process of implementing strategies among the five levels and fostering the five key areas of successful school communities in order for the caring school community to persist. It is critical to point out that the school counselor does not act alone in fostering and maintaining a caring school community; rather, he or she serves as an appropriate individual who can facilitate the active efforts of each individual who is a part of the school community. Furthermore, it is important to remember that each of the components on the wheel is interrelated. For example, a school counselor's efforts to collaborate and consult with staff can also be interpreted as a schoolwide initiative that assists educators in working effectively with students. The school counselor's efforts during individual and group counseling sessions will also impact his or her work in classroom guidance lessons as those students in counseling will be encouraged to use what they learn in counseling within

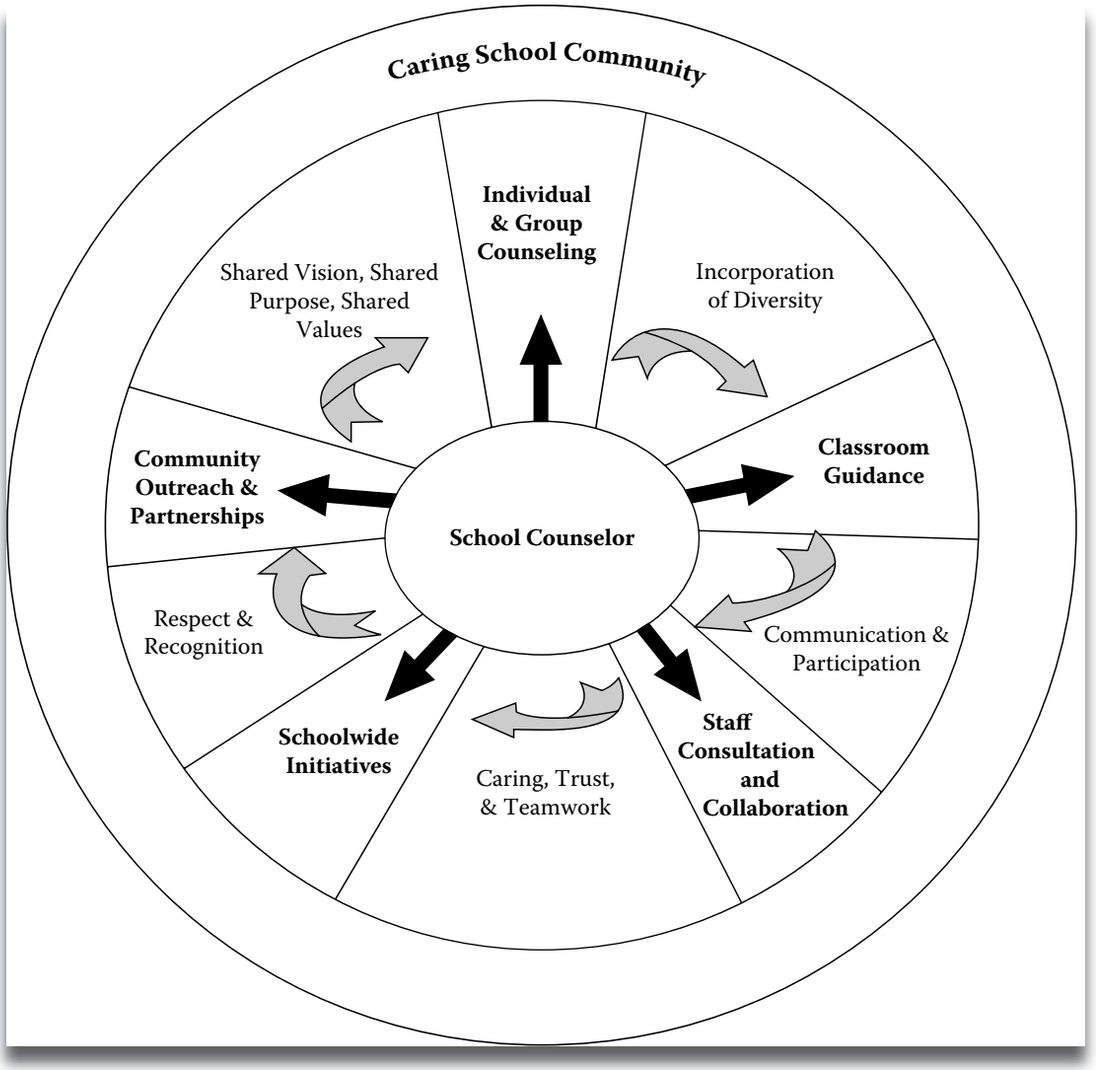

Figure 24.1
Model for fostering a caring school community.

the classroom. Finally, it will be essential for the school counselor to consider the unique cultural context of his or her school, including the critical issues, concerns, and needs of his or her school, in order to develop a more specific plan that illustrates how caring community building will take place on the wheel.

Evaluation

Evaluation in the field of education can be an overwhelming concept. With an increasing focus on accountability, evaluation can even feel like a threat. With increasing emphasis on administrative roles for school counselors, evaluation can be perceived as a burden. With challenges to the mental health role of the school counselor, being involved in evaluation can lead to a sense of role conflict. We want to suggest that evaluation, too often the last element to be considered when implementing new programs, can be perceived as the source of useful feedback and an important aspect of continual improvement. We also want to suggest that program evaluation need not be an onerous project.

As part of the implementation plan for creating a caring community, we advocate that the implementation team, which should include the school counselor, identify the behaviors and attitudes that they associate with a caring community. Each plan should articulate its goals in terms of attendance, academic performance, participation rates, and even discipline referrals. Much of this information is already collected as part of the data that schools are required to report to the district. At the start of the program, the team should identify the current state of affairs.

We recommend that the team, in the first few years of implementation, collect the data on a monthly basis to identify the trends. As we all know, there are seasonal trends to behaviors that get lost in yearly reports. We also

advocate that this process of evaluation not be confused with research. The goal is not to develop an experimental test of the theories guiding the plan, but to see how, in a particular school, behaviors change over time.

With this data, the team can see where and in which ways the plan is working. If there is a change in the participation rates or the attendance rates, then the team can see which part of the plan may be affecting that change. If there is not a change in a targeted behavior, such as discipline referrals, then the team can make targeted changes in the plan rather than feel they have to change everything.

Most importantly, this data can help the team and the school to celebrate change. As stated earlier in the chapter, one of the characteristics of a caring school community is taking the time to reflect on what they do. The data that is collected as part of that evaluation is a wonderful way to trigger that self-reflection.

Case Example

This case of Sam provides an example of how one school counselor served as a key individual in helping the student to become integrated into the school community. Sam was a third-grade student who felt very disconnected from the school. He and his family had recently moved to the community and were one of a few racial/ethnic minority families in the small, rural town. The transition to his new school was challenging, and he did not feel like he belonged among his classmates. From the beginning of the school year, Sam appeared to be isolated from his peers, teachers, and other school staff. Sam preferred working alone on all tasks, even when the students were placed into small groups or were encouraged to choose a partner. Sam lacked appropriate social skills that oftentimes made his peers hesitant to interact with him and made his teachers uncertain of how to best meet Sam's needs. During lunch and recess, Sam chose to distance himself from others, finding a far-off corner where he could eat or play by himself. If a teacher or other adult in the school encouraged him to work with the group, Sam displayed a great deal of anxiety, frustration, and anger that was often interpreted by both children and staff as inappropriate hostility. There was a growing concern about Sam that was expressed by his teachers, his school counselor, his parents, and other members of the school who observed Sam become more and more withdrawn. It was evident that Sam was lacking a connection to his school community, and the school community evidently had to shift in order to help Sam feel cared for and connected to his peers, teachers, and other school staff.

In order to evaluate Sam's needs, the school counselor initiated a meeting among multiple individuals within Sam's life, including his classroom teacher, the school psychologist, a special education teacher, and Sam's parents. These individuals met and shared their perspectives in order to understand how each one of them could help Sam to become more a part of the community. It was particularly important for Sam's parents to be able to express their thoughts and gain a more complete picture of Sam's well-being both at school and outside of school. Collaboratively, these individuals worked toward a *shared vision* and were united by a common purpose: to help Sam feel as though he was cared for and accepted into the school community. After a great deal of thinking, sharing, and planning, several interventions were put into place in order to meet the goal of welcoming Sam into the community. The school counselor took on the responsibility of coordinating regular communication among these individuals in order to assess Sam's progress across the interventions. Furthermore, she would ensure that meetings would be held periodically in order to continue sharing ideas, reflections, and questions related to Sam's well-being. Through this process, effective *communication* and active *participation* was established among all of the individuals involved in Sam's well-being.

On an *individual level*, Sam worked with the school counselor to develop more appropriate social skills. The school counselor met weekly with Sam and engaged him in role-plays where they practiced appropriate ways of asking for help, saying thank you, and answering someone appropriately when he or she asks a question. Additionally, the school counselor would take responsibility for informing the other individuals, such as the special education teacher, who were working with Sam about the importance of emphasizing these skills. Through this process, Sam began to develop *trust* in his teachers and classmates and felt as if they truly did *care* for him. After Sam was able to learn basic social and communication skills and felt comfortable in role-plays with the school counselor, he began engaging in a social skills class that was facilitated by the special education teacher. Along with a small group of his peers, Sam learned how to make eye contact when speaking, to speak slowly and clearly, and to appropriately express his feelings to others in a nonthreatening manner. Within their small group, they engaged in role-plays and approached others in appropriate ways with the support of one another and the special education teacher. These skills were encouraged and reinforced by Sam's school counselor, his teacher, and his parents, who were all aware of what he was being taught in his social skills classes. Although this was challenging for Sam, he worked hard at refining his social skills and was beginning to understand how to positively interact with others in his school environment. Throughout this process, the special education teacher consulted with the school counselor about what kinds of skills Sam most needed to develop and what kinds of activities would best facilitate Sam's acquisition of these skills.

In the *classroom*, Sam's homeroom teacher also worked with him to express appropriate social behaviors with his classmates. She maintained regular contact with the school counselor, who kept her informed about Sam's development of social skills. The homeroom teacher and the school counselor also brainstormed strategies that she could use within the classroom in order to help Sam feel more welcomed by the school community. For example, Sam's teacher wrote daily notes to Sam's parents in order to inform them of their son's progress. She emphasized the strides that Sam was making and gave him personal notes of encouragement. She also gently suggested that Sam work with other students in the class, who were also in need of a friend. These students began to build friendships and began to sit next to one another in the lunchroom and play together at recess. For the first time during the school year, Sam was not always alone on the playground and was choosing to be with someone that he considered a friend. Sam was beginning to be *respected* and *recognized* as part of his classroom community.

Sam also engaged in *small group counseling* by participating in a friendship group that was facilitated by the school counselor. In the friendship group, Sam and the other children discussed and learned about what it means to be a friend and how to make friends and shared stories with one another related to friendship. Being part of this group helped Sam express himself in a way that had rarely been seen by others in the past—through drawing and writing stories. He laughed, smiled, and engaged with his peers in a creative manner that had not been seen previously by his teachers. The school counselor realized that drawing and writing might be something that could help Sam to socially engage with his peers during recess. Therefore, when the weather was suitable, the school counselor would encourage Sam to take paper, crayons, markers, and other art supplies out to the picnic tables on the playground and invite some of his peers to draw and tell stories together.

The school counselor also collaborated with Sam's *after-school program* to help reinforce the skills he was building into other contexts outside of school. The school counselor consulted with the teachers at the program and suggested that they incorporate specific lessons about the importance of belonging, showing respect for others, and giving appreciations. Sam had been especially uncomfortable around his peers in this program and would remove himself from social activities that were planned for all of the students. The school counselor suggested that the teachers at the after-school program have the students write and illustrate a story together as a group, which is something that would be a strength for Sam. With some encouragement, Sam agreed to join his peers, and over time, he felt welcomed into the group. The school counselor also suggested that the program teachers ask students to share "appreciations," or positive statements, about one another, and for the first time, Sam was able to make positive statements about others. In turn, his peers were expressing their appreciation for him being part of the group. This also became a way for the teachers to facilitate other important discussions, such as the importance of working with others and respecting multiple perspectives that are held by others. During these times, it was evident that Sam was beginning to be acknowledged by his peers as a valuable community member. The students were becoming more aware and accepting of diversity in the sense that each classmate was unique in terms of race, ethnicity, gender, and learning ability, but equally deserving of respect.

Throughout this process, the school counselor facilitated regular contact with Sam's *parents*. The school counselor met with Sam's parents and made them aware of the skills that Sam was building in school. She encouraged them to practice these same skills with him in the home and gave Sam's parents opportunities to express their ideas, questions, and frustrations. Sam's parents understood that it was very important for them to ensure that the skills Sam learned in school were also being used outside of school. They were grateful for the support that they had gained for their child and for themselves. Through this process, Sam's entire family felt cared for and involved in the school community.

The experience of being part of a caring school community was a new one for Sam. It took the collaborative efforts of multiple individuals to help address his needs. The school counselor played a key role in working with the teachers, parents, and after-school program to ensure that the environment that was once unwelcoming and uncomfortable to Sam became one that felt safe and inviting. Over time, and with a great deal of effort on the part of Sam and all of those who cared for him, Sam began to feel as if he was a true member of his community. In turn, the community was now more complete because Sam was a part of it.

This case example highlights the efforts to integrate one student into his school community and help him feel cared for by peers and adults. Sam's story illustrates how the school counselor played a central role in insuring that each of the five levels of intervention was addressed. Furthermore, throughout the process it is evident that the key elements of successful communities emerged. The school counselor employed a PYD approach that focused on the skills that Sam needed to acquire in order to experience a more positive development in school. Additionally, these efforts also addressed the other students and the larger school context by helping all individuals to develop greater respect and acceptance of Sam, a student that initially appeared to be an outcast within the school community.

Challenges and Future Directions

Although this chapter advocates that school counselors be central figures in fostering and maintaining caring school communities, the challenges inherent in doing so need to be considered. For example, school counselors continue to face misunderstanding and or conflicting ideas about their roles and responsibilities within the school (Paisley & McMahon, 2001). It is possible that taking on an active role in promoting a sense of community will not be embraced by all. In addition, school counselors, along with all educators, face countless responsibilities and need to have the time available to devote to community–building efforts. It is evident that fostering a caring school community takes a great deal of time, energy, and commitment. From a research perspective, this area of school counseling deserves more attention. Well-designed studies, both qualitative and quantitative in nature, are needed to provide a better understanding of the role of school counselors in creating caring school communities. It is important to consider conducting this research across K–12 settings. As described previously, much of the research to date has focused on implementing caring community-building programs with elementary and middle school youth. Unfortunately, a lack of attention has been given to fostering caring communities in high schools. Clearly, it is important for youth to feel a sense of belonging and connection to school throughout their educational careers. Therefore, future work will be needed to extend research and practices more fully into high schools as well.

In looking toward the future of school counseling, it is helpful to reflect back upon the quote by Baker et al. (1997) from the beginning of this discussion. In a time when youth face a multitude of challenges throughout their development, it is critical for educators to create positive, supportive learning environments that allow students to tap into their full potentials. The case example describing Sam's initial disconnect from the school community is not an uncommon story. Not only was he suffering because of his lack of connection to the school community, but the entire school context was less of a community because he was not initially part of it. The multiple strategies employed by the school counselor highlight the way in which she was able to operate from a PYD perspective to facilitate a variety of community-building strategies through collaborative efforts with students and staff. Furthermore, the case example also illustrates that school counselors need to take what Sautner (2001) calls "the challenge for educators, which is to view troubled students in terms of their strengths and potentials rather than their problems or disabilities" (p. 195). School counselors can step up to this challenge by actively engaging in efforts to create a context that allows youth to feel valued and connected to their educational process. That context is a caring school community.

School-Based Interventions

XXV
YOUTH DEVELOPMENT AND PREVENTION IN THE SCHOOLS

SALLY M. HAGE AND SARA BARNETT
Teachers College, Columbia University
JONATHAN P. SCHWARTZ
University of Houston

Recent examinations of the status of children and families in the United States concluded that our nation is in the midst of a "health crisis" (Satcher, 2000). Social indicators point to the fact that youth are at significant risk with regard to such areas as substance abuse, violence, and school dropout rates, and that access to quality services is limited (Weissberg, Walberg, O'Brien, & Kuster, 2003). For instance, 30% of 14- to 17-year-olds report involvement in multiple high-risk behaviors that jeopardize their potential for successful development (Dryfoos, 1997). In addition, about 20% of youth experience mental health problems annually, yet 75% to 80% of those do not receive appropriate interventions (Ringel & Sturm, 2001; U.S. Department of Health and Human Services, 1999). This gap in services is even larger among youth of color, who may view mental health treatment as stigmatizing (U.S. Surgeon General, 2001).

At the same time, growing evidence points to the effectiveness of preventive interventions in enhancing the development of children and youth and in averting maladjustment for individuals at risk of mental disorders or other negative outcomes (Catalano, Berglund, Ryan, Lonczak, & Hawkins, 2002). The cost burden of not addressing children's and families' mental health is enormous. Early and focused interventions have been shown to limit both the chronicity and severity of symptoms and functioning limits (Cicchetti & Toth, 1992). Therefore, expanding prevention efforts significantly reduces the costs of later mental health and other care (Cohen, 1998; Conduct Problems Prevention Research Group, 1999; Tolan & Dodge, 2005). Tolan and Dodge argued that accumulating evidence of the value of early intervention and prevention points to the need for preventive interventions to become "regular, integrated, and substantial components" (p. 603) of our nation's school and communities. This vision is consistent with the recommendation of the President's New Freedom Commission on Mental Health (2003), which has called for an expansion of early intervention services and supports that emphasize prevention, early identification, and intervention in order to maximize positive outcomes.

In this chapter, a definition of prevention is provided. A rationale for expanding the role of prevention in the schools is also clarified, and considerations for fostering prevention research and practice in school settings are presented. Finally, the chapter concludes with an appeal for school counseling training programs to assist school professionals in developing their competence in integrating prevention in their work.

What Is Prevention?

When referring to *prevention* in this chapter, the authors' definition includes one or more of the following: (a) stopping a problem behavior from ever occurring; (b) delaying the onset of a problem behavior; (c) reducing the impact of a problem behavior; (d) strengthening knowledge, attitudes, and behaviors that promote emotional and physical well-being; and (e) promoting institutional, community, and government policies that further physical, social, and emotional well-being (Romano & Hage, 2000).

This definition builds upon the most frequently cited definition of *prevention* by G. Caplan (1964), which includes three dimensions of prevention activities: primary (i.e., stopping the problem before it occurs), secondary (i.e., delaying the onset of a problem), and tertiary (i.e., reducing the impact of a problem). The authors of this chapter extend G. Caplan's definition to include efforts to enhance personal and collective well-being as well as initiatives that create social and political change aimed at improving environments where people live, learn, and work (Romano & Hage, 2000). The most successful school-based prevention programs maintain the flexibility to administer prevention at all five levels.

Historical Context of Prevention in Schools

Earlier in this book, you learned that school counseling maintains a century-long history of providing diverse kinds of services to students. Notably, prevention efforts lie at the heart of many of these services, as is illustrated by a brief overview of the history of prevention in the schools.

In response to unfortunate circumstances that resulted from America's Industrial Revolution at the start of the 20th century, vocational guidance in schools was essentially established to help *prevent* students from succumbing to a life of working long hours, making low wages, and subsisting in poverty. In the 1950s, American public schools administered air raid drills in order to prepare students for nuclear attacks, and in this way, *prevent* their physical harm. In the early 1980s, reported decline in the academic achievement of American students led school counselors to focus on students' time-management and study skills, essentially in an attempt to *prevent* continued academic underachievement (Schmidt, 2003). Thus, prevention has long been recognized as an important aspect of the work of school counselors. Yet, while school-based prevention efforts have been ever-evolving, these efforts are only now assuming a central focus in the identity of the school counselor, despite the fact that a focus on prevention is deeply rooted in the history of school counseling.

Models of Prevention

Theoretical Models of Prevention in the Schools

Prevention practice in the schools should be informed by theory as well as by research. Having a foundation in theory is 1 of the 13 principles of effective prevention programs identified by Nation et al. (2003). School-based prevention programs that are grounded in theory are considered more likely than atheoretical approaches to address the complex interactions of risk and protective factors that operate across multiple contexts (Black & Krishnakumar, 1998; Durlak, 2003; Maggs & Schulenberg, 2001; Nation et al.).

The focus of this section will be an overview and critique of the most significant theories for prevention work in schools. A number of differing theoretical models for prevention in schools have emerged in the literature, each giving varying attention to individual, contextual, and systemic factors; exhibiting a diversity of delivery mechanisms; and including divergent measures of success (Albee, 1996; Cowen, 1983; Durlak & Wells, 1997; Lorion, Price, & Eaton, 1989; Mrazek & Haggerty, 1994; Romano & Hage, 2000).

Disorder reduction or at-risk model. One of the most influential models in the field of prevention is the Disorder Reduction Model (DR; Coie et al., 1993) or At-Risk Model (AR; McWhirter, McWhirter, McWhirter & McWhirter, 1995). The DR model is defined by a biological, intrapsychic, and developmental understanding of the individual, targeting identifiable deficit through a focus on negative symptomology or empirically derived risk factors (Mrazek & Haggerty, 1994). The AR component to this model is grounded in the theoretical assumption that *all individuals* are at risk for disordered behavior, thought, or affect. One's vulnerability to dysfunction exists along a continuum, and once hallmarks of "gateway behaviors" are identified, preventive intervention may be applied to reduce one's risk of negative outcomes (McWhirter et al., 1995). Preventive efforts are directed toward the reduction of clinically defined symptoms of disorders or risk factors, as generally outlined by the *Diagnostic and Statistical Manual of Mental Disorders IV-TR* (American Psychiatric Association, 2000). A strength of this model is its flexibility, making it possible to target individuals at a variety of prevention sites—schools, families, communities, or organizations—and to employ a number of different prevention methods (e.g., school support, psycho-educational groups, mentoring).

However, the limitations of the DR model for work in the schools are significant. Under this model, prevention efforts are confined to the reduction of identified symptomology or risk factors that reside within individual students. Risk assessment, intervention strategies, and programmatic success are all conceptualized at an individual level. Broader ecological or systemic changes that could potentially disrupt factors that engender dysfunction are not a major focus of the model. Further, sustainable, self-perpetuating mechanisms of change are not a significant consideration in prevention efforts in this model. As a result, prevention professionals must repeatedly intervene when identified "gateway behaviors" emerge, rather than more profitably addressing those societal or contextual factors that foster such trajectories (Caplan & Caplan, 2000; Conyne, 1994, 2004; Vera, 2000).

Hence, not enough attention is given to addressing the broader social context for the display of negative symptoms. The result is that the model risks pathologizing the worldview and lifestyle of marginalized populations, including ethnic minorities, women, and low-income students, by not acknowledging the systemically based and socially orchestrated origins of stressors and risk factors common to many of these populations (American Psychological Association, 2003; Brooks-Gunn & Duncan, 1997; Rogler, 1999: Vera, 2000). Mock (2001) suggested that systems-based prevention efforts offer a more effective model for work with ethnic minorities than solely addressing individual needs, facilitating greater sensitivity to the focus on the collective "we" within these communities, as opposed to the "I" value that is stressed in Western cultures.

Health promotion model. A second prevention model found in the literature is the Health Promotion (HP) model (Cowen, 1994, 1996). The HP model aims to strengthen and enhance individual well-being by fostering social and emotional competencies and developing an individual's resilience. This model "assumes that as individuals become more capable and competent, their psychological well-being improves and thus they are better able to withstand or deal with the factors or influences that lead to maladjustment" (Durlak & Wells, 1997, p. 117).

A major strength of the HP model for school settings is the focus on encouraging healthy behavior and in developing protective factors, or those attributes that have been shown to lead toward stronger well-being. Such a focus supports school counselors' work in providing strength-based counseling services, while identifying risk and protective factors and creating school prevention programs designed to increase youths' resiliency to combat targeted behaviors (E. J. Smith, 2006; Wolin & Wolin, 1993). At the same time, the HP model, similar to the DR model, is limited by its individual focus and failure to address systemic, community, and institutional barriers that impede the academic progress of low-achieving students. Thus, individual gains may be difficult to sustain in systems, communities, and institutions that remain static.

Wellness model. In the Wellness model, prevention efforts aim to be proactive and to nurture five dimensions of mental health: (a) healthy caregiver–child relationships, (b) developmentally appropriate competencies for children, (c) healthy environments for human relationships, (d) effective management of stress, and (e) empowerment of people in their lives (Cowen, 1991, 1994, 2000). Hence, a major strength of this model is its focus on primary prevention and early intervention, as Cowen (1994, 2000) believed that everyone would benefit from preventive measures. In addition, this model supports a broad focus on systemic change. School professionals' work, using this model, would promote programs to strengthen healthy relationships as well as social and academic competencies and coping strategies for managing psychological stress (Cowen, 1991). Success in this model is measured not merely through individual gains, but through environmental and systemic gains.

The Wellness model overcomes many of the limitations of the DR, AR, and HP models because of its early, universal, and multidimensional approach to prevention work. Cowen's model encourages prevention professionals to address universal factors that protect against dysfunction—parent–child relationships and competencies that buffer against pervasive risk—while addressing systemic factors that may lead to dysfunction, such as powerlessness, oppression, and the caustic environments created by racism, sexism, homophobia, ableism, and other forms of oppression (Conyne, 2004; Prilleltensky & Prilleltensky, 2003; Romano & Hage, 2000).

Ecological model. A fifth model of prevention that emerges from the literature is the Ecological model (Bronfenbrenner, 1979). The grounding principle of the Ecological model is the theory that behavior occurs in a context and that to understand and prevent disordered behavior, thought, or affect, prevention professionals must consider the context in which dysfunction emerges. Furthermore, one cannot successfully prevent dysfunction without in some way addressing the contextual factors that contribute to such behavior (Bronfenbrenner; Conyne & Cook, 2004; Lewin, 1951).

A major strength of the Ecological model is that school professionals who work under this model aim to address *both* individual *and* systemic well-being (Chronister, McWhirter, & Kerewsky, 2004; Conyne, 2004; Sheras, Cornell, & Bostain, 1996). As mentioned, evidence suggested that prevention efforts that address both individual and contextual factors are more effective than prevention efforts aimed at individual factors alone (August, Lee, Bloomquist, Realmuto, & Hecter, 2003; De La Rosa, Recio Adrados, Kennedy, & Milburn, 1993; Johnson et al., 1990; Stevenson, McMillan, Mitchell, & Blanco, 1998). Thus, like the Wellness model, the Ecological model addresses systemic forces that lead to dysfunction—such as racism, violence, poverty, and oppression. However, the Ecological model is not without its limitations. Unlike the Wellness model, the Ecological model does not explicitly advocate for early, universal prevention efforts. Also, the Ecological model is limited by its tendency to engage individuals or systems only after problem behaviors or pathologies are manifested (Conyne, 2004).

Social justice model. The Social Justice (SJ) model of prevention is theoretically grounded in the notion that

pervasive sociopolitical inequity is the greatest contributor to psychological distress and dysfunction. Advocates of the SJ approach have argued that "prevention needs to be directed at the basic social, economic and political conditions that serve to maintain economic disparity" (Conyne, 2004, p. 19).

Unlike the individual focus of the DR, HP, and AR models, the SJ model is largely focused on challenging the political and socioeconomic structures of power, privilege, and poverty. For example, school professionals, in addressing issues such as male abuse of girls and women, would need to challenge "patriarchal power and the influence of male-dominated religion, corporate structure, media violence and sexuality" (Albee, 2000a, p. 850). In sum, advocates of this approach suggest that prevention professionals must address entrenched cultural values and social forces that perpetuate dysfunction in societies (Albee, 2000a, 2000b). Hence, successful prevention efforts in the SJ model not only ameliorate injustice, but also create sustainable, self-perpetuating systems that maintain a just society (Albee, 1996; Albee & Canetto, 1996; Albee & Perry, 1998; Mirowsky & Ross, 1989; Perry, 1996; Stevenson et al., 1998). A strength of the SJ model for schools is that, at its core, the SJ model is distinguished by a metaperspective of prevention and a focus on broader, socially just goals that are grounded in cultural competency and attention to inequities. Hence, unlike the five previous models, the goal of the SJ model is to dismantle all forms of oppression, rather than simply attend to the individual, family, or context.

A School-Based Prevention Model

While each of the prevention models previously outlined has unique strengths and limitations, together they highlight the fact that there is no single theoretical perspective specified for prevention practice and research in schools. However, several theoretical assumptions from these theories can be found in the renewal document provided by the American School Counselor Association (ASCA) *National Model* (2003). These assumptions may, in turn, be further integrated into the design of preventive programs and interventions that will simultaneously prevent negative outcomes and enhance positive development (Bogenschneider, 1996; Lerner, 2001; Weissberg, Kumpfer, & Seligman, 2003). The *ASCA National Model* recommends that school counselors adopt a preventive and developmental orientation, suggesting that students needing more intensive and long-term counseling should be referred to community agencies. The model advocates that school counselors provide leadership for systemic school change, particularly in the areas of academic achievement and career decision making.

This approach emphasizes a developmental, preventive, contextual, strength-based, and multicultural approach to the specialty of school counseling. School counseling programs need to apply the theoretical and research perspectives of developmental, counseling, and multicultural psychology, in partnership with school personnel, to strengthen student academic achievement, career development, and successful school transitions, especially of students from low-income or marginalized communities. In support of quality and equitable education, school counselors must advocate for all students to achieve successful educational outcomes.

Hence, in addition to providing direct services to students, school counselors need to address systemic community and institutional barriers that impede the academic progress of low-achieving students. For example, school counselors ought to work to ensure that all students receive quality academic and career information and counseling so that they are fully prepared to meet the challenges of postsecondary education and future employment opportunities. As agents of systemic change, for example, school counselors could be involved on school curriculum committees to advocate for changes that address the educational needs of students, such as selecting culturally relevant educational materials. A strong focus in the area of multicultural competency offers the means through which the professions can contribute to the academic success of students from culturally and racially diverse backgrounds, as well as to broader educational reforms that promote equity and social justice (Romano & Kachgal, 2004).

In addition, school counselors need to focus on providing strength-based counseling services, while identifying risk and protective factors and designing school prevention programs designed to increase youths' resiliency to combat targeted behaviors (E. J. Smith, 2006; Wolin & Wolin, 1993). The school counselor assists students with building strengths that include a commitment to learning, positive values that guide their choices, social competences that help them build positive relationships and succeed in life, and positive identities to promote a sense of their own power and self-worth (Benson, 1997). In sum, counselors need to adopt a multisystems approach that involves the peer group, school, and community in addition to the family as a way to fully understand students' behaviors in the contexts of their lives (Keys & Lockhart, 1999). A final component of effective school counseling emphasizes the importance of conducting needs assessments and program evaluations to strengthen school programs that deserve continuation and discontinue those that do not. This goal seems especially important in the current climate of high-stakes testing and school accountability (Osborne & House, 1995).

In sum, the ASCA (2003) model represents an exciting renewal in the training and practice of school counselors. This renewal supports a broader role for the school counselor in attending to the academic, career, and personal/social development of students. School counselors are encouraged not only to address major student issues that affect learning, but also to develop school–community partnerships, to implement comprehensive and developmental school-counseling programs, and to address issues across multiple delivery systems from remediation to prevention for *all* students (ASCA, 2003).

Prevention Practice in Schools

Recognizing that school is often the place where students' activities, experiences, and behaviors can be most closely monitored (E. P. Smith, Boutte, Zigler, & Finn-Stevenson, 2004), school counselors are perhaps in the best position to offer prevention programming to children and adolescents. Increased funding by the federal government for school-based prevention programs provides support for these efforts (Shepard & Carlson, 2003). Still, school counselors must be proactive about garnering the funds they need to effectively run a school-based prevention program. The inclusion of teachers, parents, and administrators is often integral to a school counselor's ability to successfully administer prevention programs to students. Stressing the need for such programs, highlighting risk factors within specific school communities, and reviewing research on the positive affects of prevention programming through presentations, writing letters and conducting both formal and informal meetings are just a few of the ways that school counselors can generate support for prevention.

A tailored, integrative and collaborative school-based prevention program caters to the needs of a specific school population and infuses prevention curriculum into all aspects of student life. With regard to these program goals, a systemic approach is best used to assess and intervene for the sake of preventing risky behavior and promoting positive performance in students. School counselors must consider not just what students are exposed to when they are in school, but so too what they face outside of school. This consideration helps enable school counselors to tailor prevention programming to the needs of specific student populations. Furthermore, because prevention programming that targets only the child, and in turn neglects the needs of home, school, and community environments is less effective than the more holistic approach (E. P. Smith et al., 2004), it is necessary for school counselors to serve as change agents both within and beyond the school grounds.

School-based prevention scholars have generally supported a tri-partite model to delineate the importance of contextual development considerations when it comes to designing and implementing a school-based prevention program (Miller, Brehm, & Whitehouse, 1998; Shepard & Carlson, 2003). School-based prevention programs are divided into three groups: (a) classroom approaches, (b) schoolwide approaches, and (c) multisetting approaches. A brief explanation of each approach will follow. Each part of this model stresses the need for school-based prevention programs to be tailored, integrative, and collaborative.

Classroom Approaches

One downside to the federal government's recent plan for improving public school education is that social and emotional student development efforts have taken a backseat to test-taking preparation in the classroom. In schools that embrace integrative prevention programs, however, classroom offerings are not limited to test-taking tips and training. Instead, teachers recognize the way "communication skills naturally fit into the language arts curriculum, problem solving into science and math, social skills into social studies, and mental health concepts into health and science" (Borders & Drury, 1992, p. 488).

For example, in a school where bullying hinders students' ability to concentrate in class or feel at ease on the playground, group activities in which students must work together, discussions about ethical decision making, and demonstrations of the importance of health and safety send meaningful messages and teach valuable life skills that benefit students both during and after their mastery of the content of a certain grade level. With this example in mind, school counselors should encourage teachers to integrate exercises that promote the general well-being and moral character of students into their daily classroom activities, as well as increase students' awareness of the dangers of involvement in risky behavior (Walsh, Galassi, Murphy, & Park-Taylor, 2002).

Schoolwide Approaches

In contrast to classroom-based approaches to prevention programming, schoolwide approaches deal less with direct interactions between school personnel and students, and more with the overall structure of the school schedule and school environment. Once again, as is the case with all types of effective prevention programming, "knowledge of risk and protective factors will inform the identification of target groups and program goals" (Kenny, Waldo, Warter, & Barton, 2002, p. 729). For example, a school from which the majority of students are not supervised by adults when

they return home from school may offer affordable after-school care to families with parents who work in the late afternoon and early evenings. Similarly tailored to a specific student population, in a school where students feel a great deal of pressure to succeed academically, instruction on relaxation techniques and reasonable goal setting and stress management may be incorporated into the daily schedule. At first glance, decisions regarding after-school programs and lesson planning appear to fall under the jurisdiction of school boards and school administrators. Yet, it is often the school counselor—the faculty member with a background in child and adolescent psychology and an awareness of the multitude of factors affecting students' development—who knows how to best structure a school schedule and school environment most likely to turn out well-adjusted students.

Multisetting Approaches

One major limitation to restructuring school schedules and school environments is the lack of funding that exists within so many schools. In light of this, it is important to note that an alternative—yet equally, if not more, important—way to extend prevention efforts beyond the traditional classroom is for school counselors to work with parents as part of a multisetting approach to prevention programming. For decades, schools have provided parents with psycho-educational information via home mailings and yearly meetings. However, research shows that more involved "home-school collaboration" (Shepard & Carlson, 2003, p. 642) is required in order to help parents provide the most developmentally beneficial home environment for their children. Parent-information sessions need to be complemented with parent-training sessions. The most effective of these training sessions imbue parents with specific skills, such as how to create and manage a system of rewards for household chores and how to monitor a child's academic progress by way of homework checks and test record keeping (Shepard & Carlson). Individualized consultation for parents whose children struggle in a particular area—be it socially, academically, or otherwise—is also integral to an effective home–school collaboration, as is the option of family therapy. Benefits of parental involvement in their child's school include "higher academic performance, positive student attitudes and behavior, better attendance, increased student time spent with parents, and higher graduation rates" (Shepard & Carlson, p. 643). It seems that for the sake of students' positive experience in the home—the environment said to influence students the most—school counselors must partner with families, essentially serving as a constant and reliable source of guidance and support.

Making the Tri-Partite Approach Work

Certainly, when it comes to a tailed, integrative, and collaborative school-based prevention programs, it is not enough to say that school counselors should advocate, inform, and train all those who might possibly be able to help prevent students' involvement in risky behavior. True partnerships must exist between school counselors, school administrators, teachers, and parents. To best serve students, these relationships should be distinguished by "mutual respect, collaboration and cooperation" (Borders & Drury, 1992, p. 494). School counselors must recognize the demands that weigh on school administrators, teachers, and parents, as it is neither respectful nor beneficial to criticize an administrator's policies, a teacher's approach in the classroom, or a parent's parenting skills without harboring a measure of understanding and acting with genuine diplomacy, for most school administrators, teachers, and parents operate the best way they know how with the resources they are given.

That said, school administrators who suffer under tremendous pressure with regard to the academic achievement of their respective schools may make decisions that conflict with the best interests of students' overall development. Teachers who are overwhelmed by overcrowded classrooms may be able to best serve only the minority of these students. Single parents who work two jobs and care for three children may resolve to focus on putting food on the table rather than drawing up chore charts. For these and other reasons, school counselors must recognize and acknowledge the respective efforts of school administrators, teachers, and parents, ultimately offering constructive consultation and plans for improved action, rather than harsh condemnation and unsympathetic censure. A collaborative school-based prevention program that works must be characterized by partnerships and shared goals, rather than by turf wars and animosity. In this way, the maintaining of an effective school-based prevention program makes for a challenging balancing act.

Effective Implementation

Once various key players commit to taking part in the "balancing act" that makes for a tailored, integrative, and collaborative school-based prevention program, careful consideration of how information is best received by students is necessary for ensuring a program's effective implementation. For decades, "[S]chools have been inundated with well-intentioned prevention and promotion programs that address such diverse issues as HIV/AIDS, alcohol, careers, character, civics, conflict resolution, delinquency, dropout, family life, health, morals, multiculturalism, preg-

Table 25.1 School-Based Prevention Implementation for the Tri-Partite Model

Needs Assessment	Timing	Climate	Curriculum	Presentation	Cultural Adaptation	Evaluation
Stopping a problem behavior from ever occurring						
Delaying the onset of a problem behavior						
Reducing the impact of a problem behavior						
Strengthening knowledge, attitudes, and behaviors that promote emotional and physical well-being						
Promoting institutional, community, and government policies that further physical, social, and emotional well-being						

nancy, service learning, truancy and violence" (Greenberg et al., 2003, p. 467). However, these programs are at times unsuccessful due to a lack of congruency between the ways in which students are most powerfully influenced and the ways in which said programs are implemented. This lack of congruence underscores the utility and necessity of a comprehensive needs assessment to design and evaluate the multifaceted aspects of prevention programming. Sensitive to this, the following section will focus on basic aspects of a school-based prevention program, which will be informed by a comprehensive needs assessment (see Table 25.1 for an outline of each aspect)—namely, timing, climate, curriculum, presentation, cultural adaptation, and evaluation—all of which combine to largely determine a program's level of effective implementation.

Timing. Researchers have found that children and adolescents are most likely to adopt positive behaviors if prevention education is delivered before they become exposed to risky situations (Yoshikawa, 1994). It is important to note that "children's capacity to learn depends on a number of attributes (e.g., curiosity, motivation, and ability to seek help from adults) that develop during infancy and the preschool years" (E. P. Smith et al., 2004, p. 222). This means that students can benefit from exposure to prevention programming from start to finish of their academic careers, from the time they learn to finger paint to the time they learn to read Shakespeare.

Recognizing this, creators of the 21st Century Program, developed at Brown University and included as part of President Bush's *No Child Left Behind* mission, focused their efforts on preparing children for entrance into preschool. Implemented in more than 600 schools in 17 states, the 21st Century Program provides families—that are able to pay a small fee—with high-quality childcare from 6 A.M. to 6 P.M. every weekday, easy access to health care, home visits from experienced social workers, and weekly parenting workshops (E. P. Smith et al., 2004). With a goal for cultivating prosocial habits in young children, programs such as the 21st Century Program help lay a foundation of resiliency upon which students can build as they progress through childhood and adolescence.

Climate. In addition to targeting students before risk factors transform into risky behavior, effective implementation of a school-based prevention program depends largely on a school climate that is characterized by positive psychology. Positive psychology is defined as "positive sub-

jective experience, positive individual traits, and programs that assist in improving an individual's quality of life while simultaneously preventing, or at least reducing, the incidence of psychopathology" (Akin-Little, Little, & Delligatti, 2004, p. 157). To be sure, "positive environments that evoke and reinforce positive behaviors are necessary in order to shape and maintain the optimal human experience" (Akin-Little et al., p. 160), so it is no surprise that school counselors need to secure a positive school climate—a climate of hope, trust, support, contentment, satisfaction, and understanding—in order to implement an effective school-based prevention program. Research has shown that teachers who subscribed to the practice of positive psychology "created more productive learning environments, were more complimentary of students, were more positive in their interactions with students, had more positive views of themselves as teachers, and reported greater job satisfaction" (Borders, & Drury, 1992, p. 493); all of which works to create a more promising school climate, ultimately supporting the notion that positive psychology is best adopted by all school personnel.

Curriculum. The curriculum offered in an effective school-based prevention program must be topical by not only addressing issues that affect specific school populations, but also adapting to the changing nature of today's world. In turn, effective implementation of a school-based prevention program requires that traditional curriculum, such as antidrug, antialcohol, and antiviolence initiatives, be complimented with curriculum aimed at assailing more modern risk factors as well. Since most American families have at least one computer in the home, effective implementation of a school-based prevention program now entails stressing the dangers of communicating with strangers on the Internet along with the dangers of becoming involved with drugs or alcohol. Likewise, due to the increasingly sexual nature of mainstream television and the Internet, lessons on how to detect and dissuade sexual advances from classmates and others makes for relevant and necessary preteen and teenage prevention education.

That said, it is important for school counselors to recognize the way media images that center on superficial beauty bombard anyone who merely walks down the street. K–12 students are particularly susceptible to this type of bombardment—messages sent via billboards, magazine articles, movies, and commercials suggesting that in order to be successful and accepted, girls must be feminine, skinny, and the center of the partying scene, while boys must be masculine, buff, and the center of the sports scene. As students maneuver their way through the awkward stages of childhood and adolescence, pressure to conform to these implausible standards can negatively affect students' self-esteem, potentially leading to destructive behavior, such as disordered eating and steroid use, possibly resulting in lifelong emotional scarring. Devoted to reducing the occurrence of these results, the Victorian Center for Excellence in Eating Disorders (VCEED) published *An Eating Disorder Resource for Schools*, a model program guide for preventing, detecting, and intervening in cases of eating disorders in students (VCEED, 2004).

Presentation. As a rule, school-based presentations should be nonbiased, age appropriate, structured, and time-limited with the majority resulting in either one-on-one activity or small-group work. Peer counseling and peer-mediation programs have also proven beneficial to school-based prevention efforts. Technological advancement can also factor into an effective school-based prevention presentation if it is used to enhance the program's appeal, for lessons that combine audio, video, and computing tend to resonate with the always plugged-in E-generation ("E" standing for electronic; Borders & Drury, 1992). As part of the Midwestern Prevention Project, for example, high school students view video of real-life drunk driving accidents, which essentially make palpable the dire consequences of drug and alcohol abuse (Shepard & Carlson, 2003).

To be sure, an effective school-based prevention program does not amount to students simply watching a video. Instead, interactive activities that present with problem-solving tasks must complement high-tech presentations. Whereas spectatorship alone fails to procure the type of critical thinking that prompts students to take stock of their own goals and actions, "group games, cooperative learning, discussion, role plays, and other forms of behavior rehearsal" (Clayton, Ballif-Spanvill, & Hunsaker, 2001) challenge students to put what they learn into practice and to critique one another's skills (e.g., refusing alcohol at a party, backing down from a fight, or telling the truth).

Cultural adaptation. The cultures of students who are impacted by a preventive program can vary enormously. However, many school-based prevention programs emphasize Western values and were developed and validated in middle-class communities (Kumpfer, Alvarado, Smith, & Bellamy, 2002; Vera & Reese, 2000). Prevention scholars emphasize the importance of tailoring interventions to the specific context in which they will be implemented (Durlak, 2003; Kumpfer & Alvarado, 2003; Lerner, 1995; Nation et al., 2003; Vera & Reese, 2000; Weissberg, Walberg, et al., 2003). Recommendations suggest that school interventions should be carefully designed to meet the cultural, community, and developmental characteristics of the child, school, and community (Castro, Barrera, & Martinez, 2004; Durlak, 2003; Gottfredson, Fink, Skroban, & Gottfredson,

1997; Nation et al., 2003; Weissberg, Walberg, et al., 2003). Existing research suggests that preventive interventions that are culturally adapted to fit the specific context of the student participants are more successful in recruiting and retaining participants (Kumpfer et al., 2002).

Several cultural factors are important to consider in designing prevention programs; these include students' level of acculturation, acculturative stress, migration and relocation history, language preferences, socioeconomic status, geographic location, education, religion and spirituality, extended family support, racial and ethnic identity, relationship to nature, time orientation, and culturally specific risks and coping strategies (Kumpfer et al., 2002). In addressing these factors, cultural adaptations should go beyond superficial changes, from including ethnic minorities in written materials to addressing important cultural values and practices (Kumpfer et al.). In determining adaptations, however, efforts to preserve the integrity of core program elements should be made, and as much as feasible, program strength and dosage should be sustained (Castro et al., 2004; Greenberg et al., 2003; Kumpfer et al.). Such efforts support the design and implementation of culturally relevant and effective preventive interventions. Finally, school professionals who adapt and deliver programs with cultural sensitivity and awareness of cultural nuances need to be provided with a high level of cultural competence (Castro et al.).

Evaluation. Feedback from students, teachers, and parents is critical to a school counselor's ability to make necessary adjustments to a school-based prevention program, ultimately contributing to a constant refinement process. Historically, program evaluation has consisted of descriptive reports on kinds of services offered, amount of time spent on each activity, and number of students served. Increasingly, program evaluation focuses on program results, rather than on program services, in order to truly gauge a program's effectiveness. Specifically, scholars suggest that school counselors specify learning domains (e.g., attitudes, behavior, and academic achievement) with which to structure a program's evaluation. Then, through observation, case study, participant/nonparticipant comparison, and interviews, school counselors can assess the specific areas in which students have either made improvement or remained largely unaffected by program efforts. This data helps school counselors to reevaluate and restructure future programs, as well as identify students who are in need of additional guidance and support. Additionally, included in any valid and reliable program evaluation is assessment made by program participants. In turn, it seems student assessment of school-based prevention programming is necessary for ensuring its continued success.

Prevention Research in Schools

Research knowledge supporting the efficacy of prevention in school and community settings has accumulated substantively in recent years (Catalano et al., 2002; Durlak, 2003; Greenberg, Domitrovich, & Bumbarger, 1999; Greenberg et al., 2003; Nation et al., 2003; Vera & Reese, 2000; Weissberg, Walberg, et al., 2003). The benefits of prevention are further supported by research indicating that it is more effective and less costly to promote positive development in the absence of a crisis than to intervene after a problem has developed (Albee & Ryan-Finn, 1993; Catalano et al.; Durlak; Elias, 1997; Luthar & Cicchetti, 2000). In the next section, a brief overview of the literature informing prevention practice in schools will be presented.

One of the most significant reviews of prevention research was carried out by The APA Task Force on Prevention, Promotion, and Intervention Alternatives in Psychology, which contacted 900 experts on prevention to identify 14 model prevention programs (Price, Cowen, Lorion, & Ramos-McKay, 1988). A similar effort by the second APA task force on prevention, named Prevention: Promoting Strength, Resilience, and Health in Young People, resulted in the synthesis of a larger body of research into a special issue of the *American Psychologist* in June/July 2003, which identified key findings and standards for evidence-based prevention practice for children and youth (Weissberg, Kumpfer, & Seligman, 2003). An additional function of the APA task force was to identify effective practice in the prevention of youth behavior problems by reviewing two federal studies sponsored by the National Institute of Justice's Office of Juvenile Justice and Delinquency Prevention and the Center for Substance Abuse Prevention (Kumpfer & Alvarado, 2003). Based upon their analysis of these prior studies, Kumpfer and Alvarado identified 13 principles of effective family-focused intervention. These strategies included tailoring for age, developmental level, and cultural traditions, as well as providing sufficient treatment dosage and intensity to address risks.

In addition, another comprehensive review of positive youth development programs was conducted by Catalano et al. (2002), who examined 161 programs that focused on developing youth competencies, such as positive relationships with adults, peers, school, community, or culture; social, emotional, cognitive, behavioral and moral competence; prosocial norms; identity development; self-efficacy; adaptive coping; spirituality; and belief in the future. Of those 161 programs, 77 had methodologically sound evaluations and had enough detail of the intervention, participants, and evaluation measures to warrant further consideration. Among the 77 programs, 25 were found to be effective in promoting varied positive outcomes, as well as reducing problem behaviors.

The 25 programs that were most effective had been carried out over a longer period of time (9 months or more) and used structured materials to facilitate consistency in delivery. The review also provided support for extending interventions across multiple contexts, including school, family, and community settings. Seventeen of the 25 effective programs were implemented in either two (usually school and family) or three contexts (community, school, and family). All of the effective programs were directed toward strengthening social, emotional, cognitive, or behavioral competencies and standards for healthy social behavior within the family and community. The majority of the effective programs also strove to build healthy relationships between youth and adults and provide recognition for prosocial involvement.

Catalano et al. (2002) suggested that more evaluation research is needed to demonstrate the effects of model prevention programs in new settings. This recommendation is consistent with ASCA's (2003) suggestion that school counselors conduct needs assessments and program evaluations to strengthen school programs that deserve continuation and discontinue those that do not.

Furthermore, Nation et al. (2003) conducted a "review-of-reviews," surveying 35 comprehensive reviews of prevention research published between 1990 and 1999 that focused on five problem areas: (a) substance abuse, (b) risky sexual behavior, (c) violence, (d) delinquency, and (e) school failure, and/or dropout. From these reviews, Nation et al. identified 252 characteristics of effective prevention programs. The authors further analyzed these characteristics to determine practices that were generalizable across the five problem areas. Through this process, Nation et al. identified nine characteristics of effective prevention programs. Overall, effective programs (a) were comprehensive, (b) used varied instructional methods, (c) were of sufficient dosage or intensity to affect change, (d) were based upon theory, (e) promoted positive interpersonal relationships, (f) were appropriate for participants in terms of developmental level and culture, (g) provided sound training for staff, and (h) included meaningful program evaluation. Nation et al.'s work builds upon Durlak and Wells' (1997) meta-analysis of research on 177 primary prevention programs for children and adolescents, 18 years of age or younger, that were delivered across school, home, clinic, and other settings and evaluated in comparison with a control condition. The meta-analysis revealed that both competence-building and problem-reduction programs were largely effective (59% to 82% of participants in the primary prevention programs were doing better on the target criteria in comparison with the control groups), although nine of the programs had some negative impact.

Finally, Greenberg et al.'s (2003) synthesis of the research literature on school-based prevention and youth development programs identified a number of effective strategies (e.g., designing comprehensive, multiyear programs that foster respectful relationships) that are also consistent with Nation et al.'s (2003) recommendations (Weissberg, Walberg, et al., 2003). Taken together, these reviews provide a substantial body of research evidence to inform the work of prevention practitioners in school settings.

At the same time, while an expanding body of prevention research has clarified practices that contribute to program effectiveness, many prevention efforts have not demonstrated efficacy. It is not clear whether some programs are not effective or just not appropriately evaluated. Catalano et al.'s (2002) suggestion that more evaluation research is needed to demonstrate the effects of model prevention programs in new settings is consistent with the ASCA (2003) recommendations that school counselors conduct needs assessments and program evaluations to strengthen school programs that deserve continuation and discontinue those that do not.

Youth Development Programs in School Settings

The next section of this chapter will present several model school-based prevention programs that have been developed for different grade levels. These examples illustrate the type of prevention program that may be collaboratively developed by prevention-oriented professionals in school settings.

High/Scope Perry preschool project. This longitudinal project (Schweinhart & Weikart, 1988), beginning in 1962, followed 123 African American children from low-income families living in Michigan. Fifty-eight children were randomly assigned at ages 3 and 4 to a high-quality preschool program offering parent information and support while 65 children did not participate in a preschool program. An evaluation completed when participants were 25 years of age (Barnett, 1993) revealed that participants who attended the aforementioned preschool program had higher levels of academic achievement, college attendance, employment, and earnings, and lower levels of special education, antisocial behavior, incarceration, and teenage pregnancy in comparison with those not attending the preschool program. Estimated taxpayer savings were $30,000 to $90,000 per participant. Furthermore, continued benefits of the program have been documented through interviews with 97% of the study participants at age 40 (Schweinhart et al., 2005). In comparison with those who did not attend the program, preschool participants continued to demonstrate

higher earnings, higher rates of home ownership and savings, and fewer arrests, with a societal return of $17 for every tax dollar invested in the program.

Although the findings of Schweinhart et al.'s (2005) study cannot be generalized to early intervention programs that do not offer similar program components (e.g., highly trained teachers, home visits by teachers at least every 2 weeks, and low teacher–student ratios), the findings do suggest that high-quality early intervention can support adult success. The study is notable for the random assignment of children to program and no-program groups and for the long-term follow up on multiple indicators with low rates of participant dropout.

Assertiveness Training Intervention. An example of a primary prevention program for elementary students with no identified interpersonal problems is the Assertiveness Training Intervention (Rotheram-Borus & Weinkart, 1988). This intervention is based on evidence suggesting that assertion is linked to positive self-esteem and adjustment in elementary school. An assertiveness training program was conducted for 2 hours per week for 12 weeks in elementary school classes. The assertiveness training intervention was based on social learning theory (Bandura, 1977) and followed a manualized treatment of didactic presentation and behavioral practice with feedback. A sample group of 343 fourth to sixth graders at a predominately White middle-class school were assigned to three conditions: (a) assertiveness training, (b) a no-treatment control, and (c) an alternative treatment (self-confidence-training simulation game).

An evaluation of the Assertiveness Training Intervention (Rotheram-Borus & Weinkart, 1988) found that participants in the assertiveness training program demonstrated more assertive responses to problem solving, initiated more contacts with teachers, showed less problem behavior in the classroom, and had higher academic achievement at 1-year follow up when compared with the control and alternative treatment groups. A limitation of the study was the lack of diversity in the sample, while a strength of the study was the utilization of control and comparison groups as well as assessment at 1-year follow up.

Strengthening Families Program (SFP). The SFP was first administered in 1982 as a 14-session program with parent and youth skills training components for children ages 6 to 12 and parents who abused drugs or alcohol (Kumpfer et al., 2002). Five culturally modified interventions were developed and evaluated in 27 separate studies with rural and urban African Americans in Alabama and Detroit, Asian/Pacific Islanders in Hawaii, Spanish-speaking Hispanic families recruited from schools and community housing, and Ojibwa tribe Native Americans in Iowa. When the results of the culturally adapted interventions were compared with studies assessing the effects of the generic version of SFP, findings revealed levels of participation and retention were 41% higher for the culturally modified interventions, with only slight improvements in outcome.

The Midwest Prevention Project. The Midwest Prevention Project (Pentz, 1998) was an example of a community-based substance-abuse prevention program, which demonstrated efficacy in preventing adolescent substance abuse by addressing casual factors across individual and contextual domains. The components of the project included a parent communication-skills program, a social skills training program for youth, a mass-media campaign, and school and community policy modifications regarding the availability of alcohol and tobacco (Wandersman & Florin, 2003). School programming began in grade six as students entered middle school and continued over 5 years, with the school program being delivered in the first and second years, community interventions and changes in tobacco and alcohol policy being instituted in the third through fifth years, and mass-media coverage taking place across all years.

Eight of the 50 schools in the Midwest Prevention Project were randomly assigned to either the full prevention program or a delayed intervention control condition. The other schools were assigned to prevention and control conditions based upon school scheduling and demographic matching. Longitudinal research with 8,500 students (70% White, 23% African American, and 7% other) in 50 schools indicated that the combination of school and community programming contributed to larger and more enduring effects in preventing serious levels of drug use throughout the high school years than did a program of school-based intervention alone. Although the findings suggested the superiority of interventions that extend across multiple contexts, further research is needed to understand the impact of each program component and to determine an optimal and most cost-effective combination of program components, frequencies, and duration in preventing substance use and abuse and in promoting positive educational outcomes.

The Teen Outreach Program. The Teen Outreach Program (Allen, Philliber, Herrling, & Kuperminc, 1997) was developed as a collaborative program between the Association of Junior Leagues International, local Junior League chapters, and school districts across the United States. The program was designed to prevent teenage pregnancy and school failure, as well as to foster prosocial norms, posi-

tive identity, self-determination, and belief in the future by involving high school students in volunteer service in their communities, coupled with school-based activities focusing on self-management and life skills, decision making, and adaptive coping. This was an experimental design in which 695 high school students from 25 schools nationwide were randomly assigned to either Teen Outreach or a control condition to assess program effectiveness.

Adolescents who participated in Teen Outreach evidenced lower rates of pregnancy, school failure, and academic suspension in comparison with teens assigned to a control condition. These findings provide support for the effectiveness of the Teen Outreach Program specifically, as well as for the benefits of volunteer service in promoting positive development as an alternative to problem-focused intervention. Long-term follow-up data is needed to determine whether program effects last over time and whether similar effects may be found for males in promoting academic achievement and engagement.

Future Directions for School-Based Prevention

As the school counseling field continues to redefine the roles and identity of its members, we urge school leaders to take necessary steps to overcome any existing barriers that may hinder the development of a prevention focus and to move toward a deeper commitment to a prevention agenda, as articulated in this chapter. Given that traditional mental health services systems have failed to significantly reduce the effects of debilitating social and emotional distress in the vast majority of the people in the United States, a movement toward a primary prevention focus in the schools offers much hope for improving the health and well-being of our nation's children and families (U.S. Department of Health and Human Services, 2000).

Without a doubt, the movement toward a prevention focus in school settings has important implications for the training and preparation of school counselors and other school professionals. In order to ensure a high level of professional competency among school counselors in the area of prevention, it is essential that students receive specialized training and supervised practice in the development, implementation, and evaluation of prevention programs. While we recognize the difficulty in adding additional course work to already overburdened school-counseling training programs, content related to prevention needs to be incorporated into existing counseling program course work, such as theoretical foundations, evaluation, group, consultation, practica, and internships. In addition, incentives need to be created to encourage midcareer school professionals to further incorporate prevention approaches into their work with children and families (Mrazek, 2002; Tolan & Dodge, 2005). Finally, efforts to build stronger collaboration between school and community professionals need to be put into place.

In closing, strengthening a prevention orientation in the school counseling field would orient school-based professionals to a *broader application* of their work, with the goal of more effectively and sensitively responding to the tremendous social needs that exist in our communities. The result of this shift would be to change the lens and context for their efforts from an individually focused, adaptation approach to one that includes before-the-fact intervention involving groups, communities, and social systems and is ultimately aimed at social change. As noted by Greenberg et al. (2003), "The choice is clear. We have the science to foster children's social, emotional, and academic learning" (p. 473). The future beckons school-counseling professionals to work together with researchers, educators, and policy makers to design, coordinate, implement, manage, and evaluate youth-development programs for every student's success. Through these collaborative efforts, school counselors can make sure that no child is left behind and that all children and adolescents have the opportunity to realize their potentials.

XXVI
INDIVIDUAL COUNSELING AS INTERVENTION IN THE SCHOOLS

JERI L. LEE AND STACIE E. PUTMAN
Tennessee State University

Intervention in the schools takes the form of individual counseling when immediacy, brevity, and specialized solution focus are required to assist in solving problems, reducing stress, or enhancing a student's academic and social success. To understand the role and applications of individual counseling in the schools, it is necessary for professional school counselors (PSCs) to consider the following:

- Definitions/model for individual counseling in the schools
- Mandates for scope of practice for individual counseling in the schools
- Basic competencies required for individual counseling in the schools
- Appropriate theoretical orientations for individual counseling in the schools

Kutash and Duchnowki (2004) described the importance of individual counseling in the schools during their examination of urban children with emotional disturbances: "The most common service currently being supplied by school personnel was individual counseling and this was provided for 63% of the students while child-serving agency personnel were providing individual counseling for 17% of the youth" (p. 235).

Definitions/Model for Individual Counseling in the Schools

Defining Individual Counseling in the Schools

Gibson and Mitchell (2003) stated that individual counseling is "a one-to-one relationship involving a trained counselor and focuses on some aspect of a client's adjustment, developmental, or decision-making needs" (p. 76). More specifically, individual counseling in the schools takes two forms: traditional and focused. Traditional individual counseling in the schools is offered to all students. By contrast, focused counseling is reserved for those experiencing significant personal problems. In other words, the traditional type depicts the relationship between a PSC and all students in his or her caseload; the focused type depicts the relationship between a PSC and students identified as at risk.

Traditional individual counseling in the schools. Baker and Gerler's (2004) description of individual counseling, applied here as a definition for traditional individual counseling in the schools, is "part of an individual planning process for which the goals are to help students monitor their career, academic and personal development" (p. 118).

Focused individual counseling in the schools. Focused individual counseling in the schools refers to a confidential relationship between a student and a PSC counselor focused on enhancing the student's academic and/or social success at school by identifying a problem, establishing and implementing a solution involving both internal and external resources, and then monitoring the results to determine effectiveness. Focused individual counseling is geared toward at-risk students.

The concept of at-risk students can be difficult to operationalize. Baker and Gerler (2004) listed eight critical personal problems identified in the schools as

- Acting-out behaviors
- Underachievement
- Disabilities
- Grief
- Suicide ideation and depression

- Substance abuse
- Social isolation
- Floundering career planning

For each of these personal problems, the PSC assists students by clarifying their problems, identifying internal and external resources, and referring out when a diagnosable condition is suspected and further treatment is warranted.

A Model for Individual Counseling in the Schools

Orton's (1997) counseling model, consistent with the previous definitions, suggested four stages:

- Build a counseling relationship
- Assess specific counseling needs
- Design and implement interventions
- Conduct evaluation and closure

These four stages apply whether you are offering traditional or focused individual counseling. A relationship must be formed before any student will open up to you. Assessing needs or identifying problems is a critical role in both prevention and intervention. Interventions that draw upon a student's internal and external resources become the solutions to identified problems. Follow-through in the form of ongoing evaluation and, ultimately, closure completes the relationship.

Mandates for Scope of Practice for Individual Counseling in the Schools

Determining when to provide individual counseling in the schools requires a clear grasp of the PSC's scope of practice regarding individual counseling. Three initiatives establish individual counseling as a critical function of PSCs: The American School Counselor Association's (ASCA) National Model for Comprehensive School Counseling Programs (1998), The National School Counselor Training Initiative (Guerra, 1998), and The School–Community Collaboration Model (Campbell & Dahir, 1997).

Evidence-Based Treatment
